OFFICE OF SANY. COMMR. FOR BENGAL,) F. W. A. DE FABECK

APPENDIX No. III.

REPORT OF THE COMMISSION APPOINTED TO ENQUIRE INTO THE CAUSES OF THE EPIDEMIC PREVALENCE OF FEVER DURING 1880 AND 1881.

Report of the Commission appointed to enquire into the causes of the epidemic Fever in Nuddea.

"In the Resolution of the 10th November 1881, in the Medical and Municipal Department, His Honor the Lieutenant-Governor, in noticing that the presence in Nuddea of a malarious fever, in a severe epidemic form, two seasons in succession seemed to point to some local cause distinct from climatic influence, appointed us as a Commission to visit the worst villages, and to examine carefully their sanitary condition and the cause of their unhealthiness. We were further directed to inspect, as far as possible, all the roads constructed during the past 15 years, and to ascertain whether there was any truth in the statement so often made of the inadequacy of the waterway provided in such roads; to enquire into obstruction of drainage by the silting up of old channels and creeks; to give special attention to the supply of drinking-water, and endeavour to induce the people, where the water-supply is now deficient, to clean old tanks and excavate new ones and place them under the charge of the village punchayets, in order that they may be kept clear for water-supply; to impress upon the more intelligent villagers the necessity of purifying water and show how simply and cheaply an efficient filter can be constructed; to call upon the zemindars to assist in opening and draining channels and excavating tanks; and to impress upon the people the precaution of sleeping on raised platforms or *machans*.

2. "The sum of Rs. 50,000 was likewise placed at our disposal to meet the cost of making such improvements as we might consider *urgently necessary*.

3. "*Tour*.—In pursuance of the above orders, we remained on tour in the Nuddea district from the beginning of December 1881 to the middle of March 1882, when the lateness of the season compelled us to return to Kishnaghur without having been able to visit either Beerbhoom or Jessore.

4. "During our tour we visited and examined some four hundred villages, traversed the roads made within the last 15 years and many of earlier construction, inspected numerous embankments, and followed the courses of several old rivers. The route taken by us whilst making our investigations and enquiries will be found marked on a map appended to this report. [Not printed].

5. "*Topography*.—The district of Nuddea is a vast alluvial plain intersected by six large rivers, numerous smaller channels, and by a labyrinth-like network of forsaken river-beds and old rivers in every stage of decay and effacement. It is dotted with lagoons and marshes, and studded with numerous towns and villages, which are frequently hidden in clumps of bamboos and clusters of trees. The lands are closely cultivated. As in all deltoid formations, the fall of the country is away from the rivers, but the regularity of the slope is broken up by the tangle of rivers and river-beds which cross and recross one another and obstruct the natural lines of surface drainage.

6. "*History of the fever*.—It is in this district that a severe malarious fever has prevailed for the past two years. The reports of Dr. Sutherland and others have shown the history of epidemic fevers in Bengal in former years, and our enquiries have brought nothing new to light. It is quite clear that fever has long been present in Nuddea, and in villages such as Oola, Ichapore, Srinugger, and Jaharpore it is never dormant for any length of time.

7. "The present outbreak was first noticed in the middle of 1880, when the deaths from fever in this district rose from 1,927 in July to 3,759 in August, culminating in November with a mortality of 12,822. The tracts chiefly affected during the period of greatest fever mortality in that year (*i.e.*, the six months, August 1880 to January 1881) were the sub-divisions of Bongong, the Sudder, and Meherpore. In Chooadanga the more easterly portions alone were affected, the condition of the western thanas being normal. In this sub-division, according to Baboo Judoo Nath Bose, sub-divisional officer, the fever was traced to the village of Hurinakunda, in the Jhenidah sub-division of Jessore, where it prevailed virulently in 1879. From this place it was transferred in 1880 westwards to Jaharpore and Paikpara and other villages situated on the banks of the Bhatahi, a stream formerly connected with the Kumar, but now a closed water-course. The fever did not, in 1880, travel further than Kulcherra, a village about two miles north-east of Chooadanga town. Since then the disease has spread over the whole sub-division.

In 1880.

8. "The worst thana, however, in 1880 was Gaighatta, in the south of Bongong, where the recorded fever death-rate for the half-year from August 1880 to January 1881 was 41·25 per mille. The few neighbouring villages of the 24-Pergunnahs, such as Janapole, Pairigatchi, &c., are said to have been equally affected. The thanas of Hanskhalli, in the centre of the district, and Teyhutta, on the north-west, come next, giving respectively fever death-rates of 39·07 and 36·75.

9. "Generally speaking, in the season of 1880 fever prevailed over a tract of country situated on a line drawn across the district from south-east to north-west. The sub-divisions of Ranaghat (with the exception of portions of Jaguli) on the south and Kooshtea on the north escaped this visitation.

10. "The total number of deaths from fever for the calendar year of 1880 was 54,420; but as this epidemic did not break out till July, for the purposes of comparison it may be better to consider the months from August to January as showing the incidence of fever, in which case the mortality may be put at 51,783 for those six months.

11. "In 1881 the virulence of the fever appears to have spread northwards and westwards, subsiding very considerably in the southern subdivisions, where in thana Bongong the highest death-rate was 28·54, while in Ranaghat it did not rise above 19·19. This subsidence of fever in the south of the district was not preceded or accompanied by any local alterations or improvements.

In 1881.

12. "Kooshtea sub-division, as a whole, again escaped; the highest recorded death-rates being 19·81 from Bhaluka in 1880, and 18·46 for Daulutpore in 1881. It must not, however, be supposed that there was no fever. Our enquiries showed that some isolated villages or groups of villages, such as Duhakhola and Durgapore, suffered severely.

13. "In the rest of the district, that is, in the Sudder (except Nuddea outpost) Meherpore, and Chooadanga, the fever was much more severe than in the previous year, Chooadanga thana itself showing a fever death-rate of 59·62 per 1,000 for six months (to January 1882); while in Kaligunge the rate rose from 28·89 in 1880 to 56·92 in 1881. It should be noted, too, that the villages in Cutwa of Burdwan and Burwa of Moorshedabad, directly adjacent to Kaligunge thana, also suffered very severely towards the close of this year

14. "The total number of deaths from fever for the calendar year 1881 was 73,196, an increase of 18,776 over the previous year; but as a fact the fever at its height was hardly more severe, as the six months from August 1881 to January 1882 show a return of 52,145 deaths as against 51,783 for the corresponding period of the year before.

15. "The disease affected the young and old with special severity. The death-rate for children under one year was 139·21 per mille during the calendar year of 1881. It falls to 24·84 in the period "20 and under 30 years," and again rises to 83·25 above sixty years.

16. "Unfortunately the mortuary registration has been so very irregular and imperfect that the above figures give only approximate results, our enquiries showing that the mortality was actually greater.

17. "*Rainfall.*—The rainfall of the district, as taken in eight different places, was examined as far back as records were available; but the results varied so considerably even between neighbouring places that it is not safe to attempt any deduction. Speaking generally for the whole district, in 1880, when the fever broke out, more rain fell than usual; but, on the other hand, the greatest fever mortality is recorded where the rainfall was rather scanty.

Probable causes of fever.

18. "In 1881 the rainfall was generally short, and the fever was again most virulent in those tracts where the fall was more deficient. The natives in places, especially west of the Jellinghi, referred the fever to this deficiency.

19. "In considering how far the natural surface drainage of Nuddea is affected by roads, embankments, &c., and what works should be undertaken for the improvement of water-channels, it will be convenient to divide Nuddea into five sections, namely, (1) between the Bhagiruttee and Jellinghi rivers; (2) north of the upper Matabhanga and the Kumar rivers; (3) between the Jellinghi and Matabhanga rivers; (4) the tract enclosed by the Kumar, the lower Matabhanga (down to Kissengunge), and the Ichamati rivers; and (5) between the Ichamati, the lower Matabhanga (below Kissengunge), and the Hooghly. Each of these sections is separated from the adjacent ones by broad rivers, and consequently it is obvious that any *local* obstructions to drainage in one can have no possible effect on the others.

Obstruction of drainage by inadequacy of waterway in roads and by silting up of old channels and creeks, &c.

20. "In the first tract we found ample waterway on every road. On some the waterway was provided by bridges, and on others (famine roads of 1874) by gaps left wherever necessary. There are no permanent embankments of any consequence.

Section I.

21. "It is deserving of particular notice that this tract of country, which has been visited by the fever epidemic with special severity, is absolutely free from artificial obstruction as far as we could ascertain. Some of the people in the neighbourhood of Goteparah were anxious to have an attempt made to open an old bed of the Bhagiruttee, known as the Goorgooriah khal, near that place, and also to open the khals from the Jellinghi at Beerpore to Mooragatcha. The outlay would be great, and the success of the schemes very doubtful, and in the case of the latter project the benefit would be slight even if the work were successful.

22. "In regard to the second tract, which, as already noticed, has, comparatively speaking, almost entirely escaped the fever, the only roads that in any way impede drainage are the Poradaha and Damookdia State Railway and the road from Durgapore to the Halsha railway station. The principal obstruction in the former is the closing of the Burral khal, on the second mile of the line, regarding which loud complaints were made to us, and apparently with reason. The want of waterway on the latter road is slight, and we understood that the matter was already receiving the attention of the Road Cess Committee. An old road from Naopara (near Mirpore railway station) to the Kooshtea-Dadupore road had evidently at one time been a serious obstruction to drainage; but the bridges on it were carried away years ago by the floods, and the gaps left (seven in number) have been widened by successive floods until there is ample passage for the water.

Section II, Kooshtea sub-division.

23. "The only embankments are those which enclose an egg-shapped basin near Alumdanga. They were constructed many years ago, and are necessary to protect the crops on the low lands, the rain-water being let out by cuts at the close of each rainy season,

24. "In the third section, fever has prevailed more or less during the past two years, and the mortality has been great. This tract is peculiarly liable to flood from both the Jellinghi and Matabhanga rivers. It was formerly traversed by two important water-courses, the Bhyrub river and the Unjonah khal, which flowed from north-west to south-east, and both of which connected the Jellinghi with the Matabhanga: they are now dead streams.

Section III.

25. "*Roads.*—As regards the roads in this section, the Meherpore and Chooadanga road requires considerable additional flood-way, though in ordinary seasons it probably passes the water without obstruction. On the road from Narainpore to Ramnugger a sluice is much required at Fullia, in thana Korempore, to admit water from the Jellinghi river at will. This, however, is a work that might be carried out under the Embankment Act by the local authorities. The roads from Kissengunge to Kishnaghur and from Bagoolah to Kishnaghur are provided with sufficient waterway to pass all *local* drainage; but in high inundations when the Bhagiruttee embankments above Moorshedabad breach, the Jellinghi becomes gorged, the local embankments give way, and an enormous volume of water is poured across country and intercepted by these roads. Probably the best way to deal with this difficulty would be either to effectually strengthen the Bhagiruttee embankments, or to lower the level of the above two roads and thus allow the floods to sweep over them. At present, on the occasion of exceptional floods, the country enclosed between these roads and the Matabhanga river and Eastern Bengal Railway is waterlogged for several weeks.

26. "There are embankments in this tract on the left bank of the Jellinghi on the Julkur Pultah Doho khal, and on the right bank of the Upper and Lower Matabhanga. The first are slight in character and have been long in existence; they do little or no harm, and when the Bhagiruttee embankments give way, retard the flood sufficiently long to enable the ryots to prepare for its effects. They would probably be mostly useless and be allowed to fall into decay if the Bhagiruttee embankments were made secure. The embankments on the Julkur Pultah Doho khal are under Government, and are known as the Kooly khal embankments, and are absolutely necessary to be retained.

Embankments.

27. "The only embankment on the Upper Matabhanga that requires notice is the Akubpore bund, which is situated at Akubpore, near Bamoondee, and was constructed 10 or 12 years ago, previous to which temporary bunds were put up by the indigo factors and removed after the indigo crop was cut. So long as temporary embankments only existed, which were annually allowed to give way, the country inland received each rains a fresh supply of good water; but since this has been stopped the water in most parts of the thana has become excessively bad and unfit for even bathing, much less drinking purposes. We had careful enquiries made, and found that out of 149 villages 61 desired the removal of the bund, 27 wished it to be retained, and 61 were indifferent. It would probably lead to difficulties if the bund were at once removed, and we would therefore recommend that, as it is close to where the bank of the Matabhanga is rapidly cutting away, it should be allowed to remain until it is cut through by the advancing river, when its re-erection should be prevented, unless those interested are prepared to provide the funds for erecting the new embankment, and for adequately sluicing it under competent professional advice.

28. "The embankments on the right bank of the Lower Matabhanga extend from below Chooadanga to above Kacheekhatta, and, with the exception of the Kacheekhatta bund, which is a Government work, were made by Mr. Skrine when Assistant Magistrate at Chooadanga. The Government bund is only about two miles in length, and is required to protect very low lands; in former times indigo-planters put up temporary bunds where Mr. Skrine's bunds now run, and the crops were temporarily protected and secured; whilst the bund bursting afterwards admitted of the land receiving a rich deposit from the silt brought in with the flood waters, and the water-supply of the people being renewed. This has now been entirely changed; a fine khal near Kudampore has been closed, and many other small channels, while the inland water-supply has deteriorated in quality. The embankment burst in 1879 in a few places, and let in fresh water, and the breaches have not been repaired; the river is now approaching the embankment at many points, and will eventually cut through it in several places. These bunds should not be allowed to be re-erected, unless they are sufficiently sluiced under the advice of a competent engineer. It is only right that we should mention that the people are greatly in favour of retaining the bunds, preferring the security of their crops to what they consider the doubtful advantage to their health.

29. "The most important works which it is desirable to undertake in this tract in order that the people may get fairly good drinking water are the opening and improvement of the Bhyrub river and the Unjonah khal, both of which are now closed at their entrances, and for a considerable distance down.

Rivers and khals.

30. "We are quite alive to the difficulty of resuscitating a dead river, but there is a peculiar feature in the case of the Bhyrub which renders success not very improbable. We refer to the (Moorshedabad) Bhyrub having through changes in the parent stream now become the main Jellinghi, and to the water being in consequence backed up in the upper reaches of the Jellinghi from which the Nuddoa-Bhyrub takes off. We therefore propose to attempt to make a channel for the water which enters the Upper Jellinghi by a cut from that river to the Bhyrub, about two miles in length and 150 feet in breadth at top. This new cut would shorten the Bhyrub by several miles, as will be seen from the map at the end

of this report; [not printed] and it already has a good outfall at the Matabhanga end. The cost would be about one lakh of rupees, of which perhaps one-sixth could be raised by local subscription. This would admit fresh water through a thickly-populated and extensive tract where it is much required. The entrance o the cut would be liable periodically to silt up, and would very probably require to be occasionally cleared out, but how often, and at what cost, we have no data to determine. If the work were successful, it would also open out a large rice-producing country to boat traffic.

31. "A project for deepening the Unjonah khal, and placing an inlet sluice at the Kishnaghur end, and a regulating sluice at the Matabhanga outlet, at an estimated cost of one lakh of rupees, has already been preparedby the Irrigation Branch of the Public Works Department, and is now under the consideration of Government. It provides for letting about six feet of water into the khal during ordinary high floods, say for about one month each year, and would doubtless be a very great improvement. It is evident, however, that the project has principally been prepared with a view to the surface drainage of the town of Kishnaghur, and although it would also give better water to the villages along the banks of the khal, we do not think that the scheme goes far enough, and would suggest that the cut should be three feet deeper, and be 20 feet instead of 10 feet in width at bottom at the Kishnaghur end. If this were done, the vlages along the khal would get a greatly improved water-supply, and the khal could be much more effectually flushed out. The cost of the work would probably be raised by these proposals from a lakh to a lakh and-a-half of rupees.

32. "We also think that it would probably be desirable to connect the Kalinga khal with the Jellinghi, by a cut near Chupra, sluiced at its head, and we would suggest that a qualified officer should be sent to ascertain the probable cost; and the extent to which those interested are prepared to subscribe.

33. "The advisability of deepening and sluicing the Sarsatti khal and its branches, and thereby enabling the water to be run rapidly off 10 or 12 square miles of low land in the cold weather, was pressed on us by those interested. At present the khal is bunded in the rains to prevent the river water entering, and the bund cut in October to let the rain water out from the Chuchookhala bhil. The question appears to be one of an agricultural rather than a sanitary nature, what is aimed at chiefly being to admit of the water being run off as quickly as possible to get in the rubbee crops. The scheme might be carried out at the cost of those benefiting by the work.

Section IV.

34. "*Roads*—In the fourth tract, which is literally seamed with old river beds, fever was particularly severe in 1881. Here we saw the only road during the whole of our investigation on which the provision of waterway had been systematically neglected; this was a very old road between Karagola and Ramnuggur, which crosses several beds of dead streams and rivers, with very insufficient waterway, and in some cases with no opening at all. We found the sub-overseer closing the breaches made by the water last year in its endeavours to escape, instead of leaving ample provision for waterway. This road should receive the urgent attention of the Road Cess Committee. We consider that a few culverts and small bridges would be desirable on the following roads:—Chooadanga to Sindreah and Kalapole, Kissengunge to Kotechandpore, Moheshpore to Chowgacha, Baghda to Garapotta, and Garapotta to Bongong. There was, however, no serious obstruction to drainage on the above roads, and in fact the last three are barely raised above the level of the country.

35. "*Embankments.*—The principal embankments in this tract are on the left bank of the Matabhanga from near Chooadanga to Moonsheegunge, and on the right bank of the Kumar from Kesabpore through Oosmanpore, Hurdui, and Kumaree to near Alumdanga: all these appear to have been either constructed or repaired by Mr. Skrine. On the Matabhanga they are low, and fast wearing down lower, and in parts will soon disappear in the advancing river. Their reconstruction should not be allowed unless they are properly sluiced, and the people would probably be better without them altogether, as the water-supply would be improved and the lands fertilized. To ascertain this, however, with certainty would require a closer enquiry than we were able to give to the matter. Several small cuts have been made in the Kumar embankments to let out the rain-water which lodges behind them: these cuts are of course reclosed. A few small sluices are required at such places. Near Alumdanga there are two breaches which have been left unclosed. If these embankments are again repaired the work should be carried out under professional supervision, and sluices be provided to allow of water being let in or out.

36. "We consider professional advice necessary in most cases of construction and renewal of river embankments, in order that the effect of a proposed work in stopping the natural escape of the spill across country and thereby raising the flood-level of the river below, and confining the floods to a few main arteries, may be fully considered before a work is undertaken. The Matabhanga and Kumar embankments, constructed by Mr. Skrine, tend to raise the flood-level below them and to concentrate the flood discharge crossing the Eastern Bengal Railway on to a few large bridges, instead of allowing it to escape by the whole of the flood openings provided on that line. Professional advice is also required to determine the number and description of sluices requisite to admit an adequate supply of water to a tract of country enclosed by an embankment—an important consideration which has in most cases been overlooked.

37. "There is a bund at Jeebunnuggur on the Bhyrub, which is sometimes cut to obtain water, the result of which is that 200 or 300 villages in the Bongong sub-division are said

to be more or less submerged; for this reason the bund should be sluiced, and should not be allowed to be cut.

38. "*Rivers and khals.*—In this tract we have a number of dead streams which were once large rivers; these are the Bhatahi, the Cobaduck or Bhyrub, the Nobogunga, and the Mysore-Chitra, and the advantage which would accrue to numbers of villages in both Nuddea and Jessore if these were re-opened has been impressed upon us in several quarters, and we fully admit this; we are, however, of opinion that the idea is impracticable. Mr. J. Fergusson in his paper "on recent changes in the delta of the Ganges," read before the Geological Society of London,* has shown how the changes in these dead rivers occur, and why they leave their old beds and take new courses, and he aptly remarks that the course of nature in this matter can be no more interfered with than a pendulum 39 inches in length can be made to beat once in two seconds of itself. It can be forced to do so for a time, by the application of machinery; but directly the pressure is removed, it will rapidly return to its normal beat. So it is with these rivers; it is their office to raise the delta by the deposition of silt, and each river flows in a given course until it has completed its work, when it either changes its direction or dies, and a new river is opened out elsewhere. The application of various expedients may retard the operation of natural laws for a time, but eventually nature will effect her end. The rivers above alluded to are already dead; to resuscitate them is practically impossible. The cause of the change above referred to is this: A river runs in a given course, gradually elevating its bed and the country near it to or above the level of the rest of the adjacent delta, until one of two things happens, namely either the river overflows into a lower tract of country, and commences to raise the new tract, or, if that part of the delta is practically levelled up and completed, the river is gradually choked by its own sediment and dies, and a new river is opened out in some other part of the delta, where the land is lower, and requires raising. The above rivers have followed this latter course; the delta in Nuddea and western Jessore has been raised and practically completed, and by the gradual deposition of silt, the line of drainage, which was formerly from north-west to south-east, is now from north-east to south. In other words, the work that had to be performed by the Bhyrub, the Cobaduck, the Nobogunga, and the Mysore-Chitra, has been completed, and the rivers have died. In their place the little Elankhali khal has opened out into the great Madhumati, and the Gorai has enlarged; and, to use Mr. Westland's words, the formative energy has been carried at one bound from the west of the Jessore district to the east of it.

* (*See* Volume XIX of the Quarterly Journal of the Geological Society, 1863.)

(*See* Westland's Jessore.)

39. "It has been argued that the Eastern Bengal Railway was originally constructed with "absurdly inadequate" waterway, and that this has had a good deal to do with the deterioration of these rivers; but we do not concur in this opinion, for they were all dead many years before that line was made. The belief probably arose as follows: In 1871 the Bhagiruthee embankments burst for the first time since 1856, and an enormous volume of water was suddenly poured across the country in consequence, and thrown against the railway; and the waterway on that line, which had hitherto been ample to pass all flood-water that crossed it, was quite inadequate to pass this unexpected additional amount, and the line was breached in several places. Additional waterway has since been provided to guard against a reoccurrence of a similar accident. We see no reason for a moment to suppose that, had the railway not existed, any of the old rivers would have again opened out, or that matters would have been different from what they now are.

40. "Another point that has been urged is that Government has been apathetic in the past, and that small amounts judiciously expended on the Nobogunga, Bhyrub, and other rivers, would have prevented their closing. We do not concur with this for the reasons already given, but consider that any money spent would have been simply thrown away, and that the rivers were choked by natural laws which must have prevailed in the end, although undoubtedly, in the case of the Bhyrub-Cobaduck, its final extinction was hastened by the construction of a cut-off near Ramnuggur on the Matabhanga, about 60 years ago. We would also notice that two attempts were actually made to keep the Bhyrub-Cobaduck open, one at its off-take from the Matabhanga, the other where the Bhyrub and Cobaduck bifurcate. The works were carried out under the direction of Mr. John May, who had been specially brought out from England to manage the Nuddea rivers, and both attempts resulted in complete failure. In regard to the Nobogunga, the practicability of re-opening it was fully enquired into in the years 1876 and 1877, and Government in the Public Works Department decided that the enquiry conclusively showed that it would be "unadvisable to undertake the re-opening of the river either for navigation or even for irrigation purposes."

(No. 746C of the 15th of August 1878).

41. "On the general question of re-opening the whole of these rivers we would remark that the Upper Matabhanga does not even now bring down sufficient water to prevent the Kumar from deteriorating. If such is the case with a stream still living, how hopeless must it be to expect that the Matabhanga would, in addition, keep open a number of dead rivers like the Nobogunga, Byrub, &c., even should artificial connections be effected.

42. "It has also been urged by Mr. Skrine and others that the construction of the Eastern Bengal Railway has caused saturation of the sub-soil in Eastern Nuddea and Jessore. A glance at the map will show that this is impossible; the railway runs parallel and close to the general course of the river Matabhanga, whilst the fall of the country trends away from that river to the south-eastward. If the waterway were inadequate, the effect

would be to divert the flood-water into the river Hooghly, and thus keep those tracts drier, and so prevent any general water-logging. As a fact, observations in December of water-level in wells showed it to be from 15 to 24 feet from the general soil surface level in the west and north-west of the district. This also was about the observed depth at which water flowed out from scarped banks of rivers, proving that there was no water-logging of the surface soil, or even of the soil generally, down to the depth of at least 15 feet. In the south and south-east of the district the subsoil water level is somewhat higher. In fact, as Dr. Sutherland observed in 1868, "the district is becoming more and more arid, tanks and other reservoirs of water dry up even before the hot season, tanks full to overflowing in the rains rapidly dry up—facts which prove that there has been of late no increase or excess of moisture in the soil." The very jungle, contrary to the assertions of some natives we met, as Dr. Lidderdale points out, is of a kind that prefers a dry to a damp habitat. In the villages themselves no doubt water-logging does occur, and Dr. Coates has clearly pointed out the cause of this in the following words*:—"About the drainage of the ordinary Bengali village. It is dug out of the common rice-field level of the country. Holes are left owing to the mud floors and walls of huts having been taken from them; tanks are dug also, and when the road has been worn below mean level, it is repaired with earth taken from excavations made alongside, which leave hollows and ditches of irregular width and depth, rarely connected with each other so as to form one continuous drain. Now these tanks, cesspits, hollows, and ditches are the drainage reservoirs of the village, and as their deepest parts are below the levels of the fields around, they cannot be thoroughly drained away."

* See Sanitary Commissioner for Bengal's No. 7268 of the 23rd of September 1879, to the Secretary to Government, Financial (Sanitary) Department, paragraphs 17 and 18.

43. "Near Damarhuda there is an old loop of the Matabhanga, which runs past Joyrampore and rejoins the river near the village of Roghonathpore. This loop or bend was a main stream many years ago. The Damarhuda end of this old bed has silted up for about half a mile, and the lower end is closed by a bund, to keep out the floods and enable the land to be cultivated. The result is that the water in this loop is not renewed from year to year, and so has become unwholesome. The people have presented a petition asking that a sluice-gate may be erected at Roghonathpore, so that water may be let in or out as desired. This would, no doubt, be a great improvement; but as the outlet has been closed by a bund made by the ryots themselves for their own advantage, this is a work which we think should be undertaken at the cost of those who benefit by the bund.

Section (V).

44. "In the fifth tract, the eastern half, which is similar in character to Section (IV), suffered most severely from fever in 1880, but less in 1881; whilst in the western half, which is generally higher than the rest of Nuddea, the fever has not been very severe in either year. The only road on which we found insufficient waterway was the road between Chogdah and Bongong. The obstruction to drainage was not excessive, but some culverts were undoubtedly required, and these we arranged to have constructed at once. This was the only work, the project for which was sufficiently advanced before we left Nuddea to admit of our sanctioning the expenditure of money on it with safety. There are no embankments in this tract.

45. "Applications were made for the opening of the Jaboona river, which formerly left the Hooghly near Kancharapara, and after a tortuous course of about 30 miles fell into the Ichâmâti, near Goala ferry. An examination made by the Irrigation Branch of the Public Works Department in 1875 showed that the bed of this khal was about 10 feet above low-water level in the Hooghly, and after this enquiry the idea of attempting to open it was abandoned. The Jaboona was undoubtedly once a larger river, but, like the other dead rivers referred to above, it has fulfilled the purpose of its existence, and is gradually disappearing. Any attempt to open it would involve the outlay of a very considerable sum, and would, there seems every probability, end in failure.

46. "As may be gathered from what has been said above, the general result of our investigations shows, that there is very little obstruction to local drainage caused by the roads and railways in the district of Nuddea, and that such obstructions, as do exist, are not of serious importance except on the rare occurrence of unusually severe floods. Further we have found that on most roads where drainage was obstructed in times past, bridges and culverts have been gradually provided, or breaches have been made to allow the floods to pass, whilst roads recently made have generally adequate waterway, so that there is now absolutely less obstruction to drainage than at any previous time within the last 20 or 30 years. In the tract between the Ichâmâti and the lower Matabhanga and Hooghly, in which the fever was severe in 1880, the slight obstructions on the Bongong road were the only ones we found in the entire tract, whilst in the tract between the Bhagiruthee and Jellinghi, which suffered most severely in 1881, we were unable to find any obstruction at all. These facts, we submit, speak for themselves, and conclusively negative the theory that local obstructions to drainage on roads and railways have been an important factor in causing the epidemic. We would further urge that in an extensive district like Nuddea, covering nearly 3,500 square miles, and traversed by several large rivers, it would be impossible for a few local obstructions to cause such a widespread outbreak of fever.

47. "There is one point in regard to the construction and repair of raised roads that requires notice, namely, the practice of raising and repairing the embankment by earth taken from deep cuttings on each side of the road, which cuttings are gradually made deeper and deeper from time to time, until they become unsightly holes filled with stagnant water for the greater part of the year. What is required is to take such a width of land as

will admit of the road being made without digging trenches deeper than two feet, and these cuttings should be afterwards ploughed in and cultivated. For future repairs cuttings should not be made more than one foot in depth, and they should from time to time be ploughed in. Where deep trenches already exist, they should be connected together where practicable, so as to admit of their drainage as far as possible.

48. "The water-supply in Nuddea is of the worst possible quality. Except the rivers taking off from the Ganges, viz., the Bhagiruttee, Jellinghi, Matabhanga, and Gorai with their off-shoots, and few baors, there is no good water in the district.

Impure and deficient water-supply.

49. "*Tanks.*—The tanks are generally small, more or less silted up, and often choked with weeds. As a rule, in and near villages their banks are broken, and they in consequence receive surface drainage while houses are in many places built near the edge of the water into which they directly drain. The water is thick and foul, greenish or brownish in colour, and contaminated with animal and vegetable debris, sometimes also full of animal life, and completely covered with floating vegetation. Many old tanks have so silted up that they contain no water.

50. "The old native custom of digging tanks for the general good seems to be dying out, as the former Deputy Magistrate of Bongong observes:—"The old class of men who used to dig tanks, sometimes for the benefit of the public, but chiefly for the good of their own souls, are gone. They have been succeeded by a generation who lack their faith, but are ignorant of the sanitary code of modern civilization. The consequence is that most of the old tanks are in ruins and overgrown with noxious vegetation, and the number of new ones is very small." The people seem, as a rule, to look to the zemindars for the excavation of tanks, and if this is their duty, they do not perform it. In fact during our tour we saw only one new tank being dug.

51. "The embankment of the rivers for protection from floods has also had a bad effect by preventing the tanks being annually replenished by a good supply of river water.

52. "The other usual causes of the deterioration of tank water were everywhere at work, such as admission of village drainage, bathing, washing of clothes, general defecation on the banks, planting trees and bamboos round them, the leaves of which falling into the water quickly rot, whilst their branches prevent the access of light and air, useful in the oxidation of animal and vegetable matter.

53. "We have done what we could to induce the people to clean their tanks, to use filters, and to adopt other precautions, but with scant success. The influence that an itinerant commission such as ours can exercise over the ignorant villagers is but slight, though they, as a rule, are fully alive to the want of good tanks, and in many instances are ready to make the necessary improvements at their own ultimate expense. Inability to raise the money stands in their way. Some labourers might be ready to assist by giving a few days' gratuitous labour as their quota, but it must be borne in mind that the bulk of the villagers do not understand earth-cutting, and would have to pay their subscription for the hire of labour in money or kind. But they have no capital; their only chance to obtain it is on loan, with the condition of repayment by easy instalments at small interest. As the zemindars in many instances are unable, and still more frequently are unwilling, to advance the money, though ready enough to stand security for its repayment by the villagers interested, we recommended the Collector to apply to Government for permission to make advances, to private persons or communities for the purpose of digging new or restoring old tanks. We are not aware what action has been taken in the matter.

54. "A condition of the loan should be that those tanks be made the property of the village community under the control of the punchayets, and should not belong to the zemindars, who might let them out for fishing, &c., to the detriment of the water-supply. The punchayets being residents have an equal and immediate interest with the people in preserving the purity of the water, which an absentee landlord has not.

55. "In all cases where loans are made, the Collector should carefully look to the position of the tanks proposed to be dug, and have those intended for drinking purposes placed out side the villages. Constant care will have to be taken to see that the banks towards the village are kept in good repair to prevent the entrance of village drainage, and that no trees or jungle are allowed to be planted or grown on the banks. In every village (and in every large *parah* if possible) one tank should be set apart for drinking alone, and no bathing or washing of pots should be permitted in it. These are obvious precautions, but we repeat them, having found that they are constantly disregarded.

56. "*Dead rivers.*—A very large, perhaps the largest, part of the water-supply of the district is from dead rivers, and nothing can be worse than their condition. Corpses are freely thrown into them as long as there is sufficient water to cover the dead body. In many parts of the district no pretence of cremation was observed, and burning their dead among the lower classes of Hindus is evidently not now the custom. Near Meherpore, on the Bhyrub, just above the municipality, where a fishing weir had created a pool, a peculiar oily scum, very evidently of animal origin, was plentiful, clearly betokening that many corpses had been thrown there, while all along the course of this stream there was further evidence of the practice. Near Akundaberia the lake that is now the source of the Cobaduck was manifestly a favourite spot for this immersion of corpses, for dozens of turtles came swimming to where we happened

Casting of corpses.

to stop to converse with the villagers, evidently mistaking our gathering for a funeral party, and so expecting to obtain a meal.

57. "Nothing can be more horrible or more dangerous than this practice of throwing the bodies of the dead—many perhaps victims of contagious disease—into the drinking water-supply of the survivors. At all costs it should be prevented. The extracts appended from communications received from Baboo Shama Charan Chatterjea and other inhabitants of Durgapur show that the more intelligent natives are fully alive to the danger, but the mass of the people are utterly careless and thoughtless. At a place called Bara Saloosh the villagers took credit to themselves for throwing their dead into the Mysore stream below their village, but only smiled when it was pointed out that this stream, a mile lower down, flowed past Kaloopole and supplied its inhabitants with water.

58. "The custom has long existed, but in this time of excessive mortality and sickness it has enormously increased, probably owing to the survivors being unfitted by ill health or prevented by poverty from obtaining sufficient fuel. The scarcity of fuel is, no doubt, the great obstacle to proper cremation; forests and jungles have long since disappeared, and the sole supply available is derived from the village lands. The amount belonging to each village is insufficient in ordinary years, and therefore cannot possibly meet the demand of periods of sickness. The difficulty is further complicated in some places by private rights in existing burning ghâts, which add greatly to the cost of cremation. Altogether the question is so involved that we confess that after careful thought we are unable to suggest any really satisfactory solution.

Fishing weirs and bunds for cultivation.

59. "The current in these dead rivers is very sluggish, and the surface of the water is frequently covered by acquatic plants, chiefly *panna*, a floating weed found everywhere in Nuddea. These plants would ordinarily exercise a cleansing action on the water if allowed to float away with the current when their work is done. But unfortunately, besides natural, there are many artificial obstructions Everywhere we have met with large fishing weirs, built from bank to bank, with perhaps a small opening at either side to allow boats to pass. These weirs are permanent during the greater part of the year, and are so contrived as to stop all but the very smallest fish. Their mischievous action is obvious; not only is the slow progress of the current retarded and scour prevented, but all matter floating on or suspended in the water is stopped, collects near, and, for some way above these weirs, rots and falls to the bottom. The water is rendered foul by such decomposition, and the channel of the stream is permanently injured. A shallow is formed by these deposits, the bed of the river silts up year by year, until a running stream is transformed into a stagnant marsh.

60. "The Unjonah khal, whose foul condition is alleged to have caused so much fever near the town of Kishnaghur, is a notable example. These traps still exist there, and until they are removed altogether, or their number very considerably reduced, there can be no hope of improvement.

61. "The Ichamati and other streams in Bongong near the sub-divisional head-quarters are gradually being injured by similar contrivances. In 1878 the sub-divisional officer, being alive to the impending danger, ordered their wholesale removal; but his decision was upset in the High Court, the obstructions were allowed to remain and even increase, and notwithstanding the remarks made in paragraph 3 of the Government Resolution of the 17th May 1881, nothing has since been done to stop the practice. The district officer seems to have considered the order of the High Court as establishing the indefeasible right of the "julkur" holder to erect fixed engines, but in our opinion the order of the sub-divisional officer was quashed on account of irregularities of procedure, and not on the merits of the question. As we consider these obstructions most deleterious, and likely to cause much damage to the future water-supply from these rivers (to say nothing of the impediments they offer to free navigation), we beg to append a copy of the High Court's order, [not printed] with a recommendation that the question should, if possible, be re-opened.

"Kamors."

62. "Another most objectionable custom of a similar nature is the introduction of large collections of green boughs and branches known as Kamors into the water (particularly of bhils and baors) for the purpose of attracting and sheltering fish, at a time, too, when the water is subsiding. Many complaints were made against this mode of fishing, and with reason. The water of the Bhatahi, on whose banks for several miles there are situated large villages, has been completely spoilt in its upper reaches: these green boughs not only rot but cause increased growth of water-weeds and propagate worms of various kinds—all fatal to the purity of the water. Of late, particularly in the Bongong sub-division, the immersion of "Kamors" has been greatly on the increase, probably owing to the failure of the sub-divisional officer's test case. If the supply of good and pure water is to be maintained, fishermen must be made to return to legitimate fishing with nets and other innocuous means.

63. "In the shallower and shallowing portions of streams, the work of deterioration is similarly hastened by the construction of earthen bunds for cultivation and fishing purposes.

Steeping jute, &c.

64. "The steeping of jute, hemp, bamboos, &c., is constantly practised, and is very objectionable. Some of the smaller bhils are thus completely ruined. In Durgapore, near Kishengunge, where

NOTE.—Dr. Lidderdale desires to record that in his opinion land suitable for the creation of fuel reserves is plentiful in Rajshahye, near Godagari, on the Ganges, in the Bhurind country, already partly under jungle, and that it might be just possible to utilize this for the production of a cheaper fuel supply to those parts of Nuddea connected by water carriage with the Ganges.

there had been an extremely heavy fever mortality, the only insanitary conditions which were specially observed were a very large accumulation of cowdung in the goalpara,* and jute-steeping in the water holes in the village and in a bhil to the westward, from which the people of one parah draw water, though most of the villagers took water from the Matabhanga.

65. "*Springs and wells.*—The water in the dead rivers after the rainy season is entirely supplied by percolation from the country through which they pass, and in the beds of some rivers the water was found forcing itself upwards in strong bubbling springs, bringing with it fine sand. Small wells dug in such situations would give good and pure supplies, but the people seem never to have availed themselves of these, as they said the holes filled up again so quickly. They should be encouraged to use them more freely.

66. "Other wells are common throughout Nuddea, but the water is never drunk if any other can be obtained. It is chiefly used for cleansing cooking pots and other household purposes. The people dislike it very much, saying that it disagrees with them, and has an unpleasant taste. Considering that the wells are sunk in the foul soil of the village, sometimes within a few feet of graves, it is not wonderful that the water should be bad. There is a cess-pool, and in larger places a well privy, often in the immediate vicinity, from which percolation must take place directly into the well. Many wells are not dug sufficiently deep, and dry up in the hot season, when the people are reduced to great straits for water.

67. "*Baors.*—There are also a few fine baors or lakes apparently parts of old river beds (chiefly in the eastern half of the district) and numerous bhils; water from the smaller ones is of bad quality, yet it is universally used.

68. "*General insanitary condition of villages.*—We have dwelt at some length on this subject of the water-supply in Nuddea, as many of its conditions are peculiar to that district. But, besides the deficiency and impurity of the drinking water, we found still prevalent in the villages themselves every insanitary defect that former observers had noted—defects that are more or less common throughout Bengal. The bad condition of the land on which villages are built is brought about by the mode of construction of houses and the habits of the people.

69. "In a country with a heavy annual rainfall and subject to inundation, houses must be well raised. Earth is used for this purpose and a homestead or "bhita" thrown up, and on top of this the house is built with a plinth of mud. This necessitates the digging of an adjacent hole, often very deep and always undrained One homestead having been formed in the manner above given, another and another is added without arrangement of any kind generally crowded together until the whole village is honeycombed with such holes. These receive every sort of household refuse, and nearly all the year round contain water of the foulest description. The water in them is often so well retained that in Asowri, for example, we found from actual levels that in March it was only about six feet below the general surface of the village.

70. "The roads are mere tracks, passing irregularly among the houses, and are often six or eight feet below the level of the foundations, so that they serve as drains, and remain wet and muddy long after the rainy season has passed. To obtain earth to raise or repair them more holes or disconnected ditches are dug which hold water, and are much used for steeping bamboos and jute.

71. "Tanks of various sizes and depths are scattered about the village. As the people go to draw water and bathe, parts of the protecting banks wear away to such an extent that the drainage from the roads passes through them into the tanks. In this way these reservoirs become shallow and foul in a very few years. In some of the better arranged villages there is a tank to each parah, placed just outside the village, but not sufficiently removed to ensure purity or freedom from village drainage when the banks are breached.

72. "Well or surface privies are erected in many a homestead without a thought or a care as to how they are ever to be cleaned; while from want of latrines or particular localities set apart for the deposit of household and other filth and refuse, the roads and open grounds, especially the edges of tanks, are fouled with the grosser forms of pollution. In the village of Alikdeah, near Chooadanga, we found it almost impossible to get down to the water in one of the tanks, its banks both outside and inside were so covered with filth; yet the water of this tank was being drunk. The mortality in this village was enormous.

73. "*Cattle-dung.*—Cattle-dung is, as a rule, never removed outside the village. A little is used in the cultivation of sugarcane and tobacco, and some for fuel, but not sufficient to make any appreciable difference in the cleanliness of the village. Cow-houses are generally placed with their backs to the road, and out of little windows the cowdung is thrown by hand. A heap is thus formed, gradually getting larger and larger, till it spills over into the road, where it is ground into dust by the hoofs of cattle and washed away by the rains into tanks and holes. It is again dug out of the holes, and even used in restoring or building walls. A house was found in a village in Gangni thana which had actually been built on an old cowdung heap, a section of the foundation clearly displaying its nature.

74. "*Diminished fertility of the soil in Nuddea.*—There is a consensus of opinion among Europeans and natives that, except in the lower lands used for the rice crop (amun dhan) reaped in the cold weather, there is a distinct decrease in the fertility of the soil of Nuddea. Considering that no land except that used for sugarcane and tobacco is ever manured, and that the Ganges floods which are so fertilizing are shut out by the embankment of the rivers, it is not to be wondered that gradually the soil should become partially exhausted.

* Goalpara is the part of a village where cowherds live.

Yet tons of the finest manure in the shape of cowdung are available in every village, but this supply, which, if utilized by the cultivators, would restore the fertility to their lands, is not only wasted, but allowed to degenerate into a positive insanitary evil.

75. "*Intra-village interment.*—'In the Mahomedan quarters of the villages the dead are constantly buried on the very borders of the tanks, and under even the doorsteps of the houses. Here and there cemeteries are to be found, but even in those places where they exist they are not exclusively resorted to. Graves may be seen scattered about in every direction, and these graves are seldom made sufficiently deep to ensure the people against poisonous exhalations from the interred bodies. In fact, the bodies lie so near the surface that sometimes, as is well known, they are disinterred by jackals and dogs.'

See Fever Commission Report of 1861.

76. "In many villages, particularly those surrounded by low lands, it is difficult to find outside their precincts any waste land sufficiently above water in the rainy season to admit of corpses being buried to the necessary depth without the graves partially filling with water, hence the burial-grounds are often situated in the very heart of the village itself.

77. "*Shade.*—Shade is necessary to health and comfort in tropical climates; it is therefore to be expected that trees would be freely grown in villages, more particularly those that yield fruit. Their growth should be encouraged, as they assist in purifying and taking moisture from the soil; but the people, from a desire for privacy, permit undergrowth to spring up and flourish all round their houses to such an extent that the ventilation of the village is greatly obstructed and foul air detained. They themselves often complained of the number of bamboo clumps grown, and considered them noxious. A thick matted covering of low jungle shielding the earth from the purifying influences of sun and air is injurious, and keeps the village site damp almost throughout the year, whilst the sheltered places thereby afforded for easement add to the bad effects.

78. "*Overcrowding.*—In the villages of Nuddea human beings and animals live in the closest proximity, and overcrowding at nights is general in the huts. Five or six persons often sleep huddled together for warmth on the floor in a hut so small that there is no room for a proper machan. As these huts, being built of mud, are almost devoid of ventilation, and are closed at night, the air before morning must become much vitiated and must add to the provocatives of fever.

79. "*Clothing of the people.*—The people seem, as a rule, to be badly supplied with clothing. This conduces not only to acute inflammatory attacks, but is very favourable to fever.

80. "*Diet.*—The diet of the lower classes is of inferior quality. Rice with a small supply of poor watery vegetables or dhall and a little salt is their daily fare. Fish is scarce in many places.

81. "Many petitions were received from villagers asking for assistance towards the excavation of their tanks; in most cases the people were ready to take loans, as mentioned in paragraph 53. In none did we consider the excavation of a tank such a work of urgent necessity as to bring it within the category of works on which we should have been justified in spending any portion of the Rs. 50,000 placed at our disposal.

Petitions.

82. "Besides the application for the drainage of the Chuchukhola bhil through the Sarsatti khal, already referred to in paragraph 33, similar applications were forwarded to us from villages near Oosmanpore in Baluka thana of Kooshtea and Bairampore in Bongongs But as they were not received until some time after we had left these sub-divisions, we were unable to visit the places in person. Mr. Anderson, the Sub-divisional Officer of Kooshtea, made minute local enquiries into the subject-matter of the first of these petitions, and his conclusions coincide with those which we formed in the matter of the Chuchukhola bhil, that these works are not of great importance from a sanitary point of view, but that the real object of the applicants was to obtain the rich bottom lands for cultivation. The matter is, however, being dealt with by the local civil authorities under Act VI (B.C.) of 1880.

83. "Other subjects on which we have received petitions have been alluded to in the body of our report.

84. "In many places we had the opportunity of meeting deputations of the more influential inhabitants, while two meetings of special importance were held at Kishnaghur and Chooadanga. At the former the question of opening the Unjonah khal was in particular discussed, while at the latter the want of proper Mahomedan burial-grounds having been pointed out, Munshis Nasimadin, Keyamadin, and other resident jotedars most generously agreed to present the necessary land. Information and advice was everywhere offered. No opportunity was lost of impressing upon the villagers the advantages of filtering water; and in order to afford them a practical illustration, Mr. Tayler, the Magistrate, ordered a three-gurrah filter to be put up at every thana, and its use and construction explained to the chowkidars on their weekly visit. We found, indeed, that some villagers were accustomed to purify water by plunging a red-hot iron into it, or even by boiling, and these practices we recommended them to continue; others, again, used alum; but usually no precaution whatever is taken.

Action of the Commission.

85. "The advantage of sleeping on machans was strongly urged, but their use is not the custom, nor is it likely that the people will improve in this respect. Apart from the fact that the smallness of the huts renders their adoption difficult, the villagers themselves

object that in their present want of warm clothing and wrappers it is more comfortable to sleep on the floor than on machans unprovided with proper bedding.

86. "Relief of the fever-striken was under the control of the Medical Department, and Government, at our recommendation, supplemented this by the liberal distribution of cinchona febrifuge to many native practitioners.

Works of urgent necessity.

87. "As we have shown above, in our opinion the outbreak of fever cannot be attributed to local obstruction to drainage from want of waterway in roads or railways, nor can it be shown that the silting up of old channels or creeks has been the immediate cause.

Summary.

88. "If it were within the range of practicable expenditure to thoroughly drain away the surface water by a system of arterial drainage laid out by professional agency and supplemented by village drains, good might result; but disconnected attempts to drain particular localities should be carefully watched, as much injury might be done thereby to adjacent places.

89. "With the exception of the Bongong road, mentioned in paragraph 44, we found that there was no work on which there could be immediate expenditure. We further considered that the excavation of tanks had better be left to the village communities themselves, aided by tuccavi loans. Thus a very large balance of the Rs. 50,000 placed at our disposal still remains unallotted. We would recommend that it be laid out on the scheme for opening the Nuddea-Bhyrub, together with any further sum which may be necessary to supplement local subscriptions.

90. "The opening of the Unjonah khal has, we understand, been already provided for.

91. "The Kolinga khal scheme, if feasible, might be undertaken by the District Board, supplemented by local subscriptions.

92. "The advantages to follow from the opening of the Nabogunga, Cobaduck, &c., would be undoubtedly so great that if Government does not consider the enquiry of 1876-77 conclusive, we would recommend, notwithstanding our own opinion expressed in paragraph 38, that the matter should be further professionally enquired into.

93. "A list of the roads examined by the Commission on which additional waterway is required is appended, with the amount of waterway necessary, so far as the visit of the Commission enabled them to determine.

94. "We have dwelt at length on the various insanitary conditions found in the villages, and have no doubt as to their very injurious action upon the general health of the people. How far they have caused or even influenced this outbreak of fever is more a matter of medical science than one to be decided by a mixed commission; but the opinion of the Sanitary Commissioner will be found in appendix B. In any case, the defects we have pointed out should be remedied. All of them are within the immediate power of the people themselves to remove. Under the guidance of Mr. Taylor and his subordinates, a few villagers have tried to improve their condition by clearing jungle, forming burial-grounds outside the villages, raising subscriptions for the improvement of the roads and drains, and in other ways; but very much more remains to be done: more power must be given to District Committees, such as is contemplated in the Bengal Government's letter No. 9212, dated 8th April 1882. We, however, feel that it is sufficient for us to call attention to these sanitary defects, and to leave it to the experience of the Magistrates and Committees to frame such bye-laws concerning them as may meet the peculiarities of their respective charges."

APPENDIX A.

Statement of additional waterway required on the roads in Nuddea inspected by the Fever Commission, so far as their visit enabled them to judge.

Name of road.	Additional waterway required.
Narainpur to Ramnuggur ...	A sluice is required at Fullia; probably two openings 5′ × 6′ would be sufficient. The road would have to be raised near the sluice, and a short channel cut from the 'Sota' or stream outside the road to the khal inside it.
Meherpur to Chooadanga ...	Fifteenth mile.—Bridge over the Kazla nullah, consisting of three openings of 20 feet; waterway sufficient, except when embankments burst. If the Akubpore bund is removed, this bridge will have to be enlarged or taken down, and a ferry substituted. Twelfth mile.—Some 15 or 20 feet additional waterway seem requisite. Sixth mile.—A flood escape of about three openings of 20 feet required near the bridge over

Name of road.	Additional waterway required.
	the Bymaree khal; the road was breached here in 1879. Fifth mile.—A six-feet culvert is necessary near Balaipore factory. Fourth mile.—A six-feet culvert is required near Alickdecah, close to the third mile-post. Third mile.—Another five-feet opening is probably wanted. Second mile.—some 20 or 30 feet of waterway should be provided near the second culvert in this mile.
Durgapur to Halsha (railway station).	An eight-feet culvert is required just outside Durgapur. Beyond Magoorah a khal is bunded, and a four-feet sluice is necessary. About one mile from Halsha, a six-feet culvert is required. About half a mile from Halsha, there is a ten-feet opening; it is sufficient, and an additonal 10 feet of waterway should be given.
Poradaha to Damookdea State Railway.	Second mile.—A bridge is required over the Burral khal, which has been closed by the railway embankment. Fifth mile.—A bridge ought to be provided over a khal that has been similarly closed in this mile. Eighth mile.—There is a small flood opening which ought to be enlarged. At present, stone ballast has to be thrown in to protect it from scour. Tenth mile.—There is another khal closed by the embankment, which should be bridged. Eleventh mile.—There is a small flood opening which should be enlarged; stone ballast has had to be thrown in to stop scour. At Damookdea there is a triangle for reversing purposes; it is of course embanked by the line on all three sides, and the only opening is a two-feet culvert at the highest end; a small culvert should be constructed at the lowest point.
Chooadanga to Sindreeah ...	Fourth mile.—A four-feet culvert is required near the fourth mile-post. Sixth mile.—Fifteen-feet of waterway ought to be provided where a six-feet culvert was carried away in 1871. Seventh mile.—A four-feet culvert is required about halfway between the sixth mile-post and the first culvert. Tenth mile.—A three-feet culvert is necessary.
From seventh mile of Chooadanga road to Kalapole and Karagola.	A three-feet culvert is required where the road turns at right angles before entering Kalapole.
Karagola to Ramnuggur ...	The waterway is insufficient throughout. The number and size of the additional openings that are needed could not be fixed from a casual inspection.
Kissengunge to Kotchandpore	Ninteenth mile.—A six-feet culvert is wanted where the road crosses a bhil. Fourteenth mile.—A six-feet culvert is necessary near the end of the mile, also a twelve-feet opening in the village of Jeebnuggur. Twelfth mile.—A four-feet culvert should be provided near the end of this mile, close to a tank. Seventh mile.—A fifteen-feet opening is necessary where the road breached in 1871. Sixth mile.—Another eight-feet opening is required at the commencement of the mile, near an existing five-feet culvert; also a four-feet culvert a few chains further on. Fifth mile.—An eight-feet culvert is necessary just before entering Baziopore village.
Hansadaha to Moheshpore ...	About two miles along the road from Hansadaha, a ten-feet flat opening is required where there is now a breach. Three small culverts are wanted near Begumpore, and between it and Moochetolla.
Moheshpore to Chowgachee ...	Two culverts (say four feet each) are required in the second mile. Between Khan Beeley and Goatully, a four-feet culvert is wanted. Within the next two miles three culverts are necessary. Ten feet more waterway is required for the bridge about three miles from Chowgachee. A culvert is wanted a few chains before reaching the Tengur bridge.
Chowgachee to Gopalnuggur	A mile beyond Khatgara a breach has been filled in; a culvert is necessary there. Another culvert is required at a breach two miles from Khatgara.
Bagdha to Garapotta ...	A three-feet culvert is wanted near Boinchakhallee, and two more three-feet culverts not far beyond that village.
Cross-road from the above to Bagoola station.	At the commencement of the road some breaches were being filled in, where waterway ought to have been provided. The extent of waterway required could not be determined.

APPENDIX B.

Note on the type of Fever.

"An enquiry into the nature of this fever was undertaken by officers of the Sanitary Department in the season of 1880, and there was no clashing of opinion concerning it. All recognized it as a malarious fever, such as is usual in Bengal during and after the rainy season, but of a very virulent kind. The Civil Surgeon of Nuddea, after two seasons' experience, speaks of it as "an ague intermittent, characterized by relapses, which in the majority of cases terminated in splenic enlargement followed by anæmia, and in prolonged cases splenic dropsy terminating in diarrhœa and death." Extreme emaciation was also often seen among the sufferers, depending upon almost complete loss of the power of digesting food.

"The fever does not differ from that described by Dr. Elliot, after enquiry in 1863, and accords with descriptions of the disease as seen in Hooghly and Burdwan during the great outbreaks in these districts.

"It has, however, some very characteristic features, making it as something apart from ordinary marsh malarious fever, viz., its virulence, its incidence in, and absence from neighbouring places, its mode of progression over the face of a country, its extreme tendency to relapse, and its difficulty to treat successfully, except without long periods of medication.

"Its virulence has been so great as to have led several careful observers, such as Dr. Elliot, Dr. Jackson, and Dr. Sutherland, to believe that it was contagious fever in the same sense as scarlet fever or small-pox is contagious. Noticing how it travelled along lines of communication, taking years at times to progress across a district—how it stuck to houses till, in many instances, nearly every inhabitant had been removed by death—how offensive the smell proceeding from the bodies of the sufferers was,—it is not surprising that this opinion of its contagious nature should have arisen, and be still held by numerous native medical men. One of the oldest and most experienced practitioners in Kishnaghur, Baboo Kali Kumar Lahori, who has seen the fever since its first appearance, believes it to be contagious, and has much to advance in favour of his opinion.

"With the light of later pathological observations, the progress in elucidating causes of disease afforded by the germ theory, and especially the cultivation of Anthrax virus of various degrees of virulence by Pasteur, it seems unnecessary to consider the fever as a contagious one. It is obvious that it requires many favouring circumstances, especially those of locality, to originate or reproduce an outbreak, and Dr. Jackson remarks that "it is intensified in old, effete, decaying, rotting places, saturated with organic debris, and that a fever, originally malarious, acquired either in Jessore or Nuddea contagious properties." Further, he says "that in the large crowded towns of western Nuddea, Oolah for instance, a still further elaboration of poison and accession of intensity occurred." That this last view is correct seems to agree with very high scientific opinion that diseases long known may, with favouring circumstances, appear in much more general and fatal forms. Pasteur has shown this with regard to the disease called Pebrine, among silkworms. The sudden and unaccountable appearance of great flights of insects passing over and devastating countries—the appearance generally of a plant which before was only noticeable by a few specimens—all assist us in reasoning that germs which in ordinary conditions are in normal number, may, under very similar, but more suitable conditions, spring up in unusual numbers and strength. Professor Tyndall writes: "Though epidemic disease requires a special contagion to produce it, surrounding conditions must have a potent influence on its development...... ....Looked at, therefore, from the point of view of the germ theory, the exceptional energy which epidemic disease from time to time exhibits is in harmony with the method of nature."

"His experiments, too, on the sterilization of liquids proved fully that the measures sufficient for complete sterilization in 1875 were quite inefficient in 1876, "in consequence of increased vitality or virulence in the contagia afloat." Following the germ theory, therefore, we may reasonably conclude that the fever which has done such havoc in Nuddea, as in many other districts of Lower Bengal, is nothing but the ordinary fever of the Gangetic delta, whose germs, by specially favouring conditions, have so intensified as to cause a very virulent and fatal disease.

"The history of cholera is a similar one. Originally looked upon as a mild endemic disease, it appeared in 1817 in Jessore in epidemic form of extreme fatality, which has been its characteristic ever since. It has acquired intensity not only in its natural home, but strength to travel all over the world.

"Dr. Sternberg, when considering the question of the occasional acquisition of virulent qualities by micro-organisms, writes:—

'The fact observed by myself, that during the summer months the mud in the gutters of New Orleans possesses an extraordinary degree of virulence, shows that pathogenic varieties of bacteria are not alone bred in the bodies of living animals. The more I study the subject, the more probable it seems to me that in this direction lies the explanation of many problems, which have puzzled epidemiologists, and that the sanitarians are right in fighting against filth as a prime factor in the production of epidemics, a factor of which the *rôle* is easily understood if this view is correct.'

"The germ theory applied to the explanation of malarious fever has numerous objectors. Lately Professors Klebs and Tommasi-Crudeli have announced the discovery of a Bacillus Malariæ in the soil of the Agro-Romano and in the blood of persons suffering from intermittent fever. M. Laveran, another investigator, found parasitic organisms, very definite in form, and most remarkable in character, in the blood of patients suffering from malarious poison.

"Dr. Oldham, however, a writer on Indian fever, has failed to find the Bacillus, and he has inoculated himself and others, and dogs with the blood of fever patients without producing the disease.

"Dr. Roy records: 'I have examined about 30 specimens of blood of fever patients in all stages of illness, and I must confess that I have not noticed any of those crescent-shaped bodies of Laveran or Bacillus Malaria of Huxley. Some small spherical-shaped bodies were discovered either clustered together round blood corpuscles, or separate, having a clear centre, and about quarter the size of a blood corpuscle. These belonged to the class of micrococci, but inasmuch as their presence was constant in all specimens of blood of fever and fever-free patients, I am inclined to look upon the admixture as accidental from the air. The microscope used in these experiments had a magnifying power of 500 diameters.'

"Dr. Sternberg, whose investigations into the etiology of the malarial fevers are published in the annual report of the National Board of Health, United States, 1881, shows reasons for the belief that a fallacy is involved in the celebrated experiments of the Italian observers, still negative evidence is not conclusive that there is no germ which produces malarial fever. We know that matter can be so finely divided as to be quite invisible under the highest powers of the microscope, and only at present discoverable and demonstrable by the electric beam. We are therefore not entitled to say that there is no germ, because it has not yet been satisfactorily demonstrated under the microscope, or, because intermittent fever exists in both dry and marshy countries, jump to the conclusion that its origin is chill. Reasoning from analogy, and using the germ theory, much is satisfactorily explained. For instance, treating the cause of the fever as an intensified malarious germ, which originated in certain highly favourable insanitary conditions, we can understand that, when transmitted from once place to another where the conditions are similar, it will grow and flourish. It requires a Mahomedpore, Srinuggur, or Oolah to bring it to full vigour, in the same sense as overcrowding is favourable to typhus poison, and, once reared, it can be carried from place to place. It accords with the history of the disease that it is removed from village to village, and if mushroom spawn can be imported from Europe to India, why should not the virus of this disease be carried in the soil on a bullock's hoof or a cart wheel? An instance, and a very marked one, of introduction has been given by Baboo Shyama Charan Chatterjea, a medical practitioner residing in Gosain Durgapur, a village on the left bank of the Pangasi. He reports: "During last year before the general outbreak of fever at Durgapur, a few people went to Belgachi to dine with a relative. They came back and got the fever. Since then the whole village was violently overtaken with the disease, which gradually assumed an obstinate and fatal type. Special centres of disease, such as Belgachi and Nagarbanka, should be carefully looked after. Any village where the usual factors of disease lie in a dormant state is much likely to catch the infection from a neighbouring place by means of human intercourse. We do not mean to say that these fevers are strictly communicable from man to man, but that the disease germ from an infected spot acts much like a ferment in an already predisposed neighbouring place. Such was the case at Durgapur. These centres of infection are in fact the *fons et origo mali*—the hot-beds of fever germs."

"Following this mode of reasoning, it is easy to explain many of the facts which have been considered stumbling-blocks in its way before. In a memorial from the zemindars, talookdars, and traders of Hooghly and Burdwan, presented in March 1869 to the Lieutenant-Governor of Bengal, they say: "But they have at the same time remarked that many low and jungly villages in which the people drink water from stagnant pools are not at all affected by the epidemic, while several villages situated on high land, and having broad roads and good drinking water tanks, have been the hot-beds of epidemic mortality." Again "it (the epidemic) is shown to have been unaccountably capricious and fitful in its incidence, seizing indiscriminately on towns whose sanitary arrangements are the best, and others where sanitation was quite neglected, and entirely overleaping tracts which there was every reason to suppose most liable to its attacks."

"The explanation is easy if we supposed that all that is required is the introduction of a virulent fever germ, carried by human intercourse chiefly. All villages and towns in Bengal are sodden with animal excrement, no matter whether they are situated on the old alluvion or the new in Burdwan or Bankoora, in Nuddea or in Moorshedabad, or Beerbhoom, and the only element apparently wanting for the creation of an outbreak of this fever in them is the presence of its own special germ.

"If they are unable to originate this type of the disease, they at any rate possess all the conditions necessary for its prevalence."

(Signed). R. Lidderdale, M.D.,

Sanitary Commissioner for Bengal.

APPENDIX C.

POLLUTION OF RIVER WATER.

Extract from notes on the probable causes of the increase of fever in and about Gosain Durgapur, by Baboo Shyama Charan Chatterjea, B.A., M.B.

"THE pollution of the only source of wholesome water is, we humbly beg to suggest, opposed to all laws, social, religious, and moral. It is a matter deeply to be regretted that the lower classes of the people have gradually got into the bad habit of throwing their dead bodies into the river water without being in any way checked. No argument is necessary to condemn such an objectionable practice. It should at once be put down by legislative measures. Our *Shastras* strictly enjoin that the dead bodies of men and beasts should not under any circumstance whatever be cast into the river. "If a Hindu (*Joogis* and *Boiragees* excepted) throws the remains of his deceased relative into the river in an unburnt state, he shall lose his caste, and not be allowed to perform the *sradh* and other religious rites for the benefit of the deceased's soul. Only children under two years of age are to be buried in the earth." So says our wise forefathers and social legislators. Annexure A contains verses from the texts of Manu, Bramhopuran, Smirtha, and Jagannauth Tarkopunchanun, as collated by Pundit Sreenath Sironioni of Durgapur. Such a consensus of opinion bearing the authority of even Manu himself deserves the respectful consideration of every enlightened government. All these high authorities unanimously declare that the contamination of drinking water by throwing dead bodies into it should be strictly interdicted under penalty of forfeiture of caste. Our countrymen cannot, in consonance with the injunctions of their own *Shastras*, raise the voice of opposition if Government should consider it worth its while to interdict this hateful practice. Some may say that such interdiction by legal measures would press rather heavily upon the poorer classes of Hindus Of course Mahomedans are altogether out of question. My only answer to such objection would be that the proposed legislation would be entirely in keeping with the teachings of our *Shastras* and the laws of sanitary science. It is a laudable custom among our well-to-do countrymen, specially in villages, that whenever a poor Hindu requests them for a supply of fuel wood to burn his deceased relatives, they immediately and unhesitatingly comply with the poor man's request. The very poorest people, who cannot afford to pay for the trifle of a funeral expense, have this resource to fall back upon to enable them to discharge their last debt to dead humanity. It is therefore to be reasonably expected that Government will not permit them to persist in a course of malpractice based upon an act of sacrilege, and opposed to the simplest rules of hygiene and common-sense."

ANNEXURE A.

Translation of Sanskrit passages.

"THERE are three different rites which should be performed in reference to a deceased person. They are thus referred to in the Suddhikáriká :—"There is the preliminary rite, the intermediate rite, and the subsequent rite. The preliminary rite is described as one which commences with cremation, &c., and ends with the offering of the *pindas* (funeral cakes)." It appears from texts like these that without cremation no right accrues to the intermediate and subsequent rites, inasmuch as he alone who has had his preliminary rite performed is entitled to the subsequent one. Hence it follows that the purificatory rite of cremation is required by all. But an objection may arise as to what is to be done with children who have not completed their second year, as cremation in their case is prohibited by the verse that "cremation should be performed to males and females alike above the age of two years." This objection is futile, since burial in the ground is provided by Yajnyavalkya in the verse "those who are under two years of age should be buried, and no libation of water is to be poured for them." From the principle that the meaning of the *Shastras* determined in one place is to be adopted in other places if there be nothing to the contrary, burial in the ground is adopted in the cases of Jugis and Vaishnabs; and from the same principle it follows that those who have no cremation should be buried in the ground.

"The water of tanks, &c., gets defiled by contact with dead bodies. Thus the Brahma Purana :—"The bodies of those animals whose meat should not be used for food defile the water of tanks, wells, and reservoirs by coming in contact therewith." Bodies means carcasses, because in the next verse the word *kunapa* or carcase is used."

APPENDIX No. IV.

REPORT ON THE EXPERIMENTAL ESTABLISHMENT OF BOVINE VACCINATION IN CALCUTTA.

First Report on Animal Vaccination in Calcutta, by Dr. K. P. Gupta, Superintendent of Vaccination, Metropolitan Circles, dated the 25th April 1883.

The Government having resolved to introduce Animal Vaccination into Calcutta, the Sanitary Commissioner desired me to send one of my first grade Deputy Superintendents to see and study the methods pursued in Bombay. Assistant Surgeon, Ram Soonder Ghose, Rai Bahadoor, readily volunteered to go, for which he deserves great credit. He left Calcutta on 1st November and reached Bombay on the 5th idem, where he studied all the procedure of calf vaccination for three weeks. He returned to Calcutta early in December and brought with him calf lymph in capillary tubes, as well as some straps for securing calves, and forceps for pressing out lymph from the vesicles.

The first calf was vaccinated on 29th January with the lymph brought from Bombay by Baboo Ram Soonder Ghose, and on the 7th day the result was seen to be very successful. Another calf was vaccinated from the first calf in the presence of the Officiating Sanitary Commissioner, Dr. DeFabeck. From the first the lymph has been transmitted to 19 calves up to 21st March, and it was therefore the 18th transmission, and with the exception of one very lean calf all proved successful.

Lymph was generally used direct from the calf to vaccinate all applicants at the depôt, and surplus lymph was stored in tubes and distributed, of which an account will be given further on. I have seen the results of several cases done with calf lymph, and nothing could be better The fact of the opening of a depôt for vaccination direct from the calf having been advertised in the newspapers, the number of applications increased considerably. Every day a number of ladies and gentlemen and others came to the depôt to have themselves vaccinated. Some came from the mofussil. I vaccinated His Honor the Lieutenant-Governor and household as well as Mr. and Mrs. Bernard with calf lymph. These were re-vaccinations, and with a single exception all proved successful. As was expected, the demand for calf lymph by Europeans and Eurasians was far greater than by natives, among whom only a few educated and enlightened persons have come forward to take vaccination direct from the calf. The table in the margin shows the particulars of cases mostly vaccinated at the depôt and a few at their homes with calf lymph.

	Total number vaccinated.	Primary.				Re-vaccination.			
		Total.	Successful.	Unsuccessful including doubtful.	Unknown.	Total.	Successful.	Unsuccessful including doubtful.	Unknown.
At the depôt...	340	214	162	18	34	126	54	45	27

Note.—For further details, *see* table appended to this Report.

Besides the above number, 183 (115 primary and 68 secondary) cases were vaccinated by the town vaccinators, of which 98 are reported to have been successful. The use of lymph stored in tubes is attended with difficulty and sometimes uncertainty. There are vaccinators who are very skilful in vaccinating with humanized virus, but they cannot use tube lymph with success. Again, all tubes are not properly filled, and hence the occasional disappointment with the use of tube lymph. Either of these two causes is sufficient to account for the few failures reported above. There is a third cause of failure which I can only hint at, and that is the unwillingness and reluctance of orthdox Hindu vaccinators to use calf lymph, and hence they wish that the experiment might not succeed. They would not touch the calf; so to accommodate their prejudices I have arranged that lymph would be squeezed out and given to them to vaccinate from. It is to be hoped that the vaccinators will get over these prejudices. Dr. McLeod having given orders to his men to use calf lymph largely, a calf is now regularly sent to the College Hospital, Municipal Office, and Park Street depôts for use of the vaccinators, and the people don't object. It has been again and again brought to notice that the difficulty of procuring vaccinifers willing to give lymph is increasing every year, and in calf lymph we have got the requisite remedy. From one calf we can vaccinate from two to three hundred persons daily, so that if any epidemic of small-pox threaten Calcutta, we can easily raise lymph to vaccinate any number of people and meet the largest demand.

Supply of tube lymph.—As all lymph direct from the calf was not used up, the surplus was stored up in capillary tubes and distributed. From 10th March an account of the supplies has been kept. It shows that 120 tubes were sent to the Sanitary Commissioner's office for distribution, 56 to the Deputy Superintendent in Town, 36 to the Deputy Superintendent of the Suburbs, 24 to Jung Bahadoor, of Nepal, 12 to Dr. King, Superintendent of the Botanical Gardens, Civil Surgeons of Dacca and Furreedpore, 4 each; 12 to the Native Doctor of Alipore jail, and 4 to Dr. Rudduck, Assam. Success has been reported by the Civil Surgeons of Dacca and Furreedpore, the Deputy Superintendents of Town and Suburbs, Native Doctor of the Alipore jail; no report from the rest.

The system has been quite a success, and the demand for calf lymph is very great. Every morning some applicants come to the depôt and have themselves vaccinated. Calves are now regularly sent out to the depôts and to private residences of gentlemen applying for them.

Experiments and observations.—The calves that were vaccinated all got fever on the 6th or 8th day, as shown by their temperature which went up to from 101° to 103°, and also by their hair being ruffled and more or less erect. By-and-bye experiments will be tried to find out whether vaccination with calf lymph is as protective as that from humanized virus, and their results will be afterwards reported.

Expenditure.—Up to 31st March Rs. 1,347-3-6 has been expended. This includes the pay of Assistant Surgeon R. S. Ghose, at Rs. 200, for one month and 18 days, and of Assistant Surgeon J. M. Bhuttacharjee, at Rs. 50, for four days, and at Rs. 100 for 25 days of March 1883. As I have not got the results of all cases done with the calf lymph, the average cost of each successful case cannot be given. But, considering the large number of tubes distributed and the large number done at the different depôts and houses with the calf, and taking the cases shown in the tabular statement given in this report, the cost of each case will be very moderate. The cost of advertisements has been great.

APPENDIX No. V.

SUMMARY OF SANITARY WORKS, IMPROVEMENTS, &c., CARRIED OUT IN TOWNS AND DISTRICTS

DURING THE YEAR 1882.

Summary of Sanitary Works, Improvements, &c., which were carried out in Towns and Districts during the year 1882.

CONSERVANCY.

In Towns.

Latrines.

Public latrines and urinals were constructed in the following Municipalities:—

Towns.	Districts.	Number with Remarks.
Ranigunge	Burdwan	3.
Bankura	Bankura	1 in kutcherry compound, 1 in Idga mohulla, and 1 kutcha latrine in place of trench latrines which were attempted, but failed, as the people would not resort to them.
Tumlook	Midnapore	1 (in progress).
Bhudresur	Hughli	1.
Serampore	Serampore	1 latrine and 2 urinals, the latter by the side of the Grand Trunk Road.
Boidyabatti	Ditto	1 at Seraputti.
Howrah	Howrah	For the courts and police.
Suburbs of Calcutta	24-Pergunnahs	15 sanctioned, and application for acquiring land for them submitted to Government.
Kishnaghur	Nuddea	2.
Jessore	Jessore	Number not mentioned.
Lalbagh	Murshidabad	3.
Murshidabad	Ditto	3.
Kandi	Ditto	Number not mentioned (in progress).
Dinagepore	Dinagepore	1 near the kutcherry.
Beauleah	Rajshahye	1 at Durgapore and temporary ones on the churs.
Nattore	Ditto	2.
Bogra	Bogra	2 for males and 1 for females, and 1 in the kutcherry compound.
Kurseong	Darjiling	1 completed and 1 in progress.
Darjiling	Ditto	1 below the Chourasta and 2 in Bhootia busti.
Julpaiguri	Julpaiguri	2.
Naraingunge	Dacca	5.
Goalundo	Faridpore	Number not stated.
Barisal	Backergunge	1 near Road Cess Office compound and 1 near Abhoy Babu's house.
Brahmanbariah	Tipperah	4.
Patna	Patna	4 and several Ramsay's portable latrines.
Behar	Patna	3.
Barh	Do.	Some Ramsay's portable latrines.
Futwa	Do.	Ditto ditto.
Arrah	Shahabad	1 near jail, one for females constructed and four more to be built in crowded parts of the town.
Madhubani	Durbhanga	6.
Durbhanga	Ditto	2 in progress, and 56 were to be constructed, making with the existing ones 100 in all.
Revilgunge	Sarun	Male and female latrines for pilgrims during Godna fair.
Chupra	Do.	3 (two with compartments for males and females and one temporary for persons attending the opium kutcherry). Additions were also made to the kutcherry latrine.
Jamalpore	Monghyr	3.
Monghyr	Do.	1 tattee latrine at Kowra maidan.
Bhagulpore	Bhagulpore	10 pucca, mat, and Ramsay's portable latrines.
Purneah	Purneah	14 (seven for males and seven for females).
Cuttack	Cuttack	3, of which one consists of tattee.
Purulia	Manbhum	2 with boundary pillars to latrine compound.

Carts, bullocks, &c.

Conservancy and night-soil carts, with bullocks, &c., for the more efficient carrying out of the conservancy arrangements, were provided in the undermentioned Municipalities:—

Towns.	Districts.	Nature of Work.
Ranigunge	Burdwan	1 Conservancy cart.
Tumlook	Midnapore	2 Ditto.
Kishnaghur	Nuddea	Conservancy carts.
Santipore	Ditto	3 Ditto.
Pubna	Pubna	1 Night-soil and three conservancy carts.
Serajgunge	Do.	2 Ditto carts.
Naraingunge	Dacca	8 Ditto and three street sweepings carts, and nine bullocks and buffaloes.
Dacca	Do.	Additional conservancy carts and bullocks number not stated.
Brahmanbariah	Tipperah	1 Night-soil cart.
Chittagong	Chittagong	Conservancy carts: number not stated.
Roserah	Durbhanga	1 Night-soil cart.
Durbhanga	Ditto	6 Ditto and street sweepings carts.

Towns.		Districts.		Nature of Works.
Bhagulpore	...	Bhagulporo	...	Conservancy carts: number not stated.
Purneah	...	Purneah	...	Night-soil carts, buckets, tools, &c.: do.
Sahebgunge	...	Southal Pergunnahs	...	1 conservancy cart.
Cuttack	...	Cuttack ...	...	Conservancy carts and 12 bullocks.
Poori	...	Poori. ...	...	12 night-soil carts in three wards: six more to be provided in remaining three wards before close of year.

Establishment.

The establishment was strengthened in the following Municipalities, in order that conservancy &c., may be more fully and efficiently attended to:—

Towns.		Districts.		Establishments.
Ranigunge	...	Burdwan	...	Sweepers: number not stated.
Tumlook	...	Midnapore ...	...	2 mehters.
Naraingunge	...	Dacca ...	...	10 mehters procured from Cawnpore.
Dacca ...	...	Do. ...	...	2 inspectors for conservancy and roads, and arrangements made to employ 100 additional mehters
Behar	...	Patna ...	...	6 sweepers.
Chuprah	...	Sarun ...	...	3 ditto.
Sahebgunge	...	Sonthal Pergunnahs	...	Conservancy establishment: strength not stated.
Poori ...	...	Poori ...	...	Sweepers: number not stated.

Buildings.

Under the head of Buildings constructed for conservancy purposes, may be mentioned a hut for sweepers and a shed for night-soil carts in the *Serampore* Municipality; a shed for the reception of dead animals in *Boidyabatti* in Serampore; stables for conservancy cattle in *Kishnaghur* in Nuddea; huts for mehters and domes in *Beauleah* in Rajshahye and *Naraingunge* in Dacca; two guard houses and two other houses, and land for public latrines in *Brahmanbariah* in Tipperah; depôts for the reception of night-soil in *Gya*; three plots of land acquired for trenching night-soil in *Durbhanga*; shed for storing night-soil at Nyagong, in *Jumalpore* in Monghyr; and a shed for carts and bullocks in *Maldah*.

Trenching night-soil.

The system of burying night-soil in trenches was established or extended in the municipalities of *Kishnaghur* in Nuddea; of *Murshidabad; of Nattore* in Rajshahye; of *Serajgunge* in Pubna; of *Darjiling* (old sites within the station abandoned and new ones below Victoria Road, sufficiently removed from dwellings, taken up); of *Brahmanbariah* in Tipperah; of *Durbhanga*, where one manured trenching ground was leased out for cultivation; of *Purneah;* and of *Poori*, in each of the six wards into which the town is divided.

General sanitary improvements.

Not the least important of the sanitary measures carried out during the year were the following:—

In the *Suburbs of Calcutta* five important bustees—Sitaram, Bindabun, Cossie, Ghasee and Malie—were reclaimed and improved at a cost of Rs. 13,001, the improvements consisting in the ground having been levelled, broad roads constructed, good tanks provided, drainage improved, houses removed and rebuilt in systematic order, arrangement made for the construction of future buildings in regular lines only, &c. The same was done with regard to certain bustees in *Howrah*, where some excellent rules, referring to position, ventilation, conservancy and drainage, were framed, to be observed when constructing new huts. The *Khoolna* station, which is to be the head quarters of the new district of that name, was being laid out, for which purpose a large plot of ground was acquired, and the present courts, which are mat structures, are to be replaced by masonry buildings. At the *Tikaree* Union in Gya, surveys have been made with the view of laying out the town and clearing out a space in its centre for a square—a small park. In this work the Maharani of the place evinced special interest. Commendable general improvements were effected in the *Purneah* and *Poori* Municipalities. In the former surface cleansings were thoroughly attended to, and, with the view of introducing the Latrine Act in the bazaars and more densely populated parts of the town, night-soil carts, buckets, tools, &c., were purchased, rules for regulating the duties of nightmen framed, and every preparation made for commencing the scheme at a cost of Rs. 2,822-11-3; but the measure had to be postponed for want of mehters, who were not procurable. The latter was divided into six wards for the better supervision of conservancy, the mehter staff was increased, night-soil carts purchased and brought into use, trenching grounds opened in each ward, better arrangements adopted for the disposal of the night-soil, and burial grounds established. Similarly in the *Chittagong* Municipality, whose former insanitary condition was a standing reproach, rank jungle was cleared, and surface cleansings and general conservancy were more closely attended to. In the *Dacca* Municipality a very commendable beginning was made in filling up the many "gors"—the receptacles for generations of sewage and the contents of the privies which literally line their borders. One large and two small ones were filled up, and two others were being similarly treated. Many of the well-privies, which seriously contaminate the water-supply in many parts of this town, were closed. The well-privies in the *Chupra* town were also similarly dealt with. In the *Naraingunge* Municipality great improvements were being effected consequent on the construction of the Dacca and Manickgunge Railway, the terminus of which will be here. New land was, therefore, being

raised and reclaimed, bazaars cleared away, and new roads made. In the *Berhampore* town a large number of obnoxious pits were filled up, notably one called the Kadai, which, owing to its extensive dimensions and great depth, was a prolific source of unhealthiness. Similar action was taken with some of the hollows in the *Beauleah*, *Pubna* and *Roserah* Municipalities. In the *Monghyr* Municipality a beginning was made in removing night-soil and waste water from the private privies by the municipal mehters without the intervention of the law on the subject, and the scheme, it is said, promises to be successful. In the *Rungpore* Municipality a garden for the cultivation of English vegetables was established on a trenching ground that had been manured, and the produce was freely sold to the public, thus supplying an important article of diet not raised by private enterprize. In the *Durbhanga* town the inhabitants were induced to adopt mud walls and tiled roofs in the construction of their houses. Two-thirds of the houses that had straw roofs and walls were thus improved.

DRAINAGE.

In towns.

General drainage schemes carried out.

The great-drainage scheme in the *Lalbagh* Municipality in the Murshidabad district, which was referred to in the Report for 1881, was almost completed by the close of this year. All that remained was turfing, and the provision of subsidiary drains which had not been considered before, but which had been commenced. The cost of this work amounts to Rs. 32,917, including Rs. 4,000, the estimated cost of the subsidiary drains. The Magistrate, however, doubts whether this scheme will work efficiently. The *Rungpore* Municipality drainage scheme was also completed, but it is said that it is difficult to maintain a thoroughly efficient outfall, as the main outlets are nine miles in length and silt forms in them annually. A great deal of the silt was, however, removed during this year. The land reclaimed by the scheme has been acquired, and, when it is occupied and cultivated, will probably yield a revenue with which the channels may be kept in efficient repair. In the *Darjiling* Municipality the Locknagor Jhora drain was improved and lengthened considerably, and the following drains were constructed, viz. one from the Bengal Secretariat to Standford House; one along a portion of the Meadow Bank Road; one from Mrs. Haughton's House on the Auckland Road, through the Cooch Behar State; one along a portion of the Victoria Road to receive the drainage of the Botanical Gardens; and one along a portion of Jeetun Jhora to drain the public road leading from the bazaar to the jail. The drainage scheme of the *Gya* Municipality was proceeded with, the Khojapi pyne series of drains having been completed, and the Kathokhur nullah series and the Madragunge nullah series, the former carrying off the drainage of the new, and the latter that of the old town, having been nearly completed. In the *Durbhanga* Municipality sluice gates were provided to the mouths of the drainage channels into which the drains of the town run, and which convey the overflow of the Bagmutti and Kumla rivers. In the *Bhagulpore* Municipality channels were constructed for draining off all surplus water to the low lands in the Mudehpoora sub-division beyond the station. In the *Purneah* Municipality the drainage of the old station, which is water-logged by the Ganges and Darjiling road, has been taken in hand, the Executive Engineer having been requested to open a culvert and to have a drainage scheme devised. In the *Maldah* Municipality the drainage was improved by arrangements having been made for flushing the sewage through the large open drains with a good fall away from houses, so that the inhabited portions of the town may be kept dry and well-drained. In the *Cuttack* and *Poori* Municipalities the drainage schemes, which were in hand last year, were further advanced. In the *Hazaribagh* Municipality a pucca drain was constructed, and the sloping of the main drain with the construction of kutcha side-drains was taken in hand. The latter work is stated to be important, as, when completed, the rain-water will flow away more readily through the main drain, which passes through the centre of the town, and the accumulation of foul water be prevented.

Drainage schemes in hand.

Systemized drainage schemes have been inaugurated in the *Culna* Municipality in the Burdwan district; in *Serampore*; in *Soori* in Birbhum; in *Azimgunge* and *Berhampore*; in Murshidabad; in *Tumlook* in Midnapore; and in *Soojagunge* in Bhagulpore.

Other drainage measures.

The drainage works, other than those mentioned above, which were undertaken during the year, may be classified as follows:—

New drains.

New drains, with the necessary culverts, pipes, bridges, &c., were provided in the following Municipalities.—

Towns.	Districts.	Towns.	Districts.
Bankura	Bankura.	Mohespore and Kishnaghur	Nuddea.
Midnapore	Midnapore.	Kandi and Lalbagh ...	Murshidabad.
Hugli, Shambazar, Jehanabad, Bali and Khanakool	Hughli.	Nattore	Rajshahye.
Ooterparah ...	Serampore.	Rungpore	Rungpore.
Joynugger, Naihati, Bussirhat, and Suburbs of Calcutta ...	24-Pergunnahs.	Pubna	Pubna.
		Darjiling	Darjiling.
		Naraingunge ...	Dacca.
		Patna	Patna.

Towns.	Districts.	Towns.	Districts.
Jehanabad	Gya.	Jamalpore	Monghyr.
Bhaboðah, Nasrigunge, and Jugdispore ...	Shahabad.	Bhagulpore ...	Bhagulpore.
Hajipore and Mahnar...	Mozufferpore.	Maldah and English Bazar	Maldah.
Durbhanga ...	Durbhanga.	Sahebgunge and Deoghur	Sonthal Pergunnahs.
Revilgunge and Chupra	Sarun.	Chatra and Hazaribagh	Hazaribagh.

Alterations, &c., to drainage.

Alterations, &c., calculated to improve the drainage generally or specially, such as providing culverts, pipes, sluices, protecting walls, &c., re-excavating, rectifying levels and removing obstructions from the drains, carrying out extensions, &c, were effected in the following Municipalities:—

Towns.	Districts.	Towns.	Districts.
		Bograh and Sherpore ...	Bograh.
Tumlook	Midnapore.	Pubna	Pubna.
Bhudresur ...	Hughli.	Goalundo	Faridpore.

Monghyr	Monghyr.	Chyebassa	Singbhum.
Colgong	Bhagulpore.		
Purneah	Purneah.		

In Districts.

Drainage works carried out in Districts.

Surveys were being made and levels taken for re-opening the old Gogra river in the *Burdwan* district. The drainage and irrigation channel on the side of the second range of the Hidglee tidal canal, in the Tumlook sub-division in *Midnapore*, was cleared of silt by the Public Works Department. The sluice gate at Satpooker in Diamond Harbour in the *24-Pergunnahs*, which had been swept away, was being reconstructed. *Nuddea.*—A good deal was done for the drainage of this fever-stricken district. Culverts were provided to four roads in the Kooshtea sub-division, and to the Chooadanga and Jhenidah road. The culverts on the latter road removed two serious obstructions to drainage, and benefited large tracts of country embraced in the four large villages of Ghosami, Boonapara, Shahapore and Doshomi. Culverts were also constructed for the drainage of six roads in the Sudder sub-division and five in the Bongong sub-division. Bridges and drains on the sides of the Chogdah and Bongong road in the last-named sub-division were also in progress. These will be finished in another six months, and are calculated to improve the sanitary condition of a large tract of land, measuring on the average 20 miles in length and about a mile in width. A drain was excavated at village Dukhinpara, in the Sudder sub-division. Survey and levels were taken along some 10 miles of the river Bhoirub in the Meherpore sub-division, with a view to providing it with a new embouchure. The result was not favourable. A large tract of low land, locally known by the name of Choonchakhola bheel, in the same sub-division, was surveyed, and a scheme for its thorough drainage is under preparation. Six miles of the Goorgooriah nullah in thanah Nakashipara, in the Sudder sub-division, was surveyed. The result was the discovery that the mouth of this nullah can be opened; but, as the undertaking will be very expensive, it has, for the present, been kept in abeyance. The whole town of Chooadanga was surveyed and a scheme for efficiently draining it, at an estimated cost of Rs. 2,500, has been sanctioned. In the *Murshidabad* district a cut was made at Farashdangah to drain the Kaligunge bheel, and two existing drainage cuts, about 8½ miles in length, for draining the town of Berhampore and the low lands and bheels between it and the Gobra nullah, were thoroughly cleared and repaired. The railway authorities in the *Dinagepore* district cut a channel at Parbuttipore with the view of draining some foul tanks; the main drainage canal was cleared of silt; culverts were put up on different roads; and the embankment for the new line of Railway from Parbuttipore to Dinagepore was completed. In the *Backergunge* district 10 khals were opened out, and a culvert on the Bikua road was constructed. In *Chumparun* the Railway embankment was completed. In the *Maldah* district much attention was bestowed on many villages embraced within a radius of 10 miles of head-quarters, and and lying for the most part on the west of the river Mohanuddi, and in the Chanchal Estate, by metalling the roads, cutting side drains, and removing jungle; and channels were excavated for the drainage of large tracts of country for agricultural extensions, for improving habitations, for providing water for drinking purposes, for improving communications by boat, and for increasing the volume of water in certain channels, thereby tending to check malarious exhalations in their neighbourhood.

By private individuals.

In the *Tumlook* sub-division in the *Madaripore* district the zemindars in Tumlook and Moisadal cleared the silt from a good number of drainage and irrigation khals; and in the *Madaripore* municipality in *Faridpore*, the zemindars of Narail and Babu Kali Krishna filled up two very large ditches.

ROADS.

In Towns.

New roads with the necessary appliances for securing drainage, water-way, &c., were constructed, or were in progress of construction, and existing roads were extended or widened, in the under-mentioned towns:—

Towns.	Districts.
Bishenpore	Bankura.
Patroshair	
Chundrakona	Midnapore.
Midnapore	
Khanakool	Hughli.
Hughli	
Jehanabad	
Shambazar	
South Suburban	24-Pergunnahs.
Joynuggur	
Busirhat	
Itanda	
Chagdah	Nuddea.
Ranaghat

Bhagulpore	Bhagulpore.
Kissengunge	Purneah.
English Bazar	Maldah.
Maldah	
Jajipore	Cuttack.

In Districts.

In the under-mentioned places important roads, whereby the sanitary condition of the villages through which they were laid was greatly improved, were constructed. They were in all cases provided with the necessary culverts, pipes, bridges, &c., for securing adequate water-way:—

Localities.	Districts.	Class of Roads.	Number.	Probable Cost. Rs. A. P.
In Sudder, Ranigunge, Cutwa, and Culna sub-divisions	Burdwan	Village	Not stated	15,174 0 0
In different villages	Bankura	Do.	20	Not stated.
In Sudder Tumlook, Contai and Ghatal sub-divisions, and Moisadal police station	Midnapore	Do.	63	11,810 7 9
In Sudder and Oolooberiah sub-divisions	Howrah	Do.	18	6,271 5 6
From Kooshtea Railway station to Kooshtea Bazar	Nuddea	......	1	Not stated.
In different villages	Jessore	Village	Not stated	17,278 7 8
In Kandi sub-division	Murshidabad	Do.	6	Not stated.
Along Satkhera khal	Khoolna	......	1	Ditto.
From Pateram to Hilli and from Khansama on the Atrai to Northern Bengal State Railway	Dinagepore	......	2	Ditto.
From Rajshahye to Maldah	Rajshahye	......	1	Ditto.
The old famine road from Mohadebpore to Sultanpore converted to a feeder road	Ditto	......	1	10,000 0 0 Government grant.
From Jeypore on the Northern Bengal State Railway to Ketlal and from Hilli to Pateram	Bogra	Village	2	Not stated.

Localities.	Districts.	Class of Roads.	Number.	Probable Cost.
				Rs. A. P.
In Serajgunge sub-division ...	Pubna ...	Village ...	5	1,024 0 0
In different villages ...	Faridpore ...	Do ...	Large number	Not stated.
In different villages ...	Backergunge ...	Do. ...	37	44,906 0 0
In different villages ...	Noakholli ...	Do. ...	Not stated ...	Not stated.
In Indurwa in Sitamurhi sub-division	Mozufferpore ...	Do. ...	1	Ditto.
In different villages	Chumparun ...	Do. ...	Not stated ...	Ditto.
From Bhagulpore overbridge to Sonthal Pergunnahs ...	Bhagulpore ...	......	Ditto ...	Ditto.
The new division road, including planting of trees on the sides of roads, &c.	Purneah ...	......	Ditto ...	36,955 0 0
From Haldipada to Panchparah	Balasore ...	Village ...	Ditto ...	Not stated.

Under the above head may also be noticed the following:—The Railway line from Dalsingserai in *Monghyr*, on the opposite bank of the Ganges, was extended to Semri Ghat, and a steam ferry established to connect this line with the East Indian Railway at Mokamah. The new division line of the Eastern Bengal Railway was constructed in *Faridpore*. This line, it is said, has caused obstruction to the drainage of a portion of the Goalundo sub-division. A tramway was established from Deoghur to Baidyanath junction station in the *Sonthal Pergunnahs*.

WATER-SUPPLY.

In Towns.

Water-supply schemes undertaken.

The scheme for supplying the *Burdwan* town with water from the Damuda, referred to in the Report for 1881, was undertaken this year. The positions of the several buildings were fixed, and the excavation of the water reservoirs and the construction of the connecting culverts commenced. The total estimated cost of the work amounts to Rs. 2,11,000, of which Rs. 50,000 will be paid by the Maharajah of Burdwan, a similar amount by Government, Rs. 1,00,000 will be raised by loan, and Rs. 11,000 obtained by the sale to Government of the municipal sluices at Joojooti. In the *Serampore* town four sluices were put up in different parts of the channels through which the condensed water from the Serampore mills is led so that its flow into different directions according to requirement may be regulated. A bathing ghat, called Mr. Carstairs' bathing ghat, was erected on the banks of the river Hughli near the Serampore College The scheme for supplying the *Howrah* town with water is yet under consideration. The chief points to be determined are: (1) whence the water is to be drawn, *i.e.*, whether from the Surusutti river, as approved by Government, or from the Hughli, as preferred by the Commissioners; (2) how to provide for the cost, and (3) what arrangements are to be made for a sinking fund in order to repay the loan to be raised for the purpose. The scheme for extending the Calcutta water-supply to the *Suburbs* has also not yet been finally determined on, the question under consideration being what share of the cost of the proposal to lay down an iron main pipe, conveying the water from Barrackpore, is to be borne by the Suburban Municipality. In the *Berhampore* town, wells were dug in the dry bed of the Bhagirutti in front of the town, in order to meet the great want of water felt there, in consequence of changes in the bed of the river Ganges at its entrance, by which the supply of water from that river to the Bhagirutti was reduced almost to *nil*. In *Nattore* town, in Rajshahye, channels were cut to admit river water freely into the large moats around the rajbari and into the outer moats. In the *Pubna* town, a pump, the gift of the late Magistrate, Mr W. M. Clay, was put up on the west bank of No. 1 station tank, and an iron cistern was supplied, which has proved a great convenience to the people, and is much used, the neighbouring river Echamutti was bunded, and a large supply of fairly good drinking water retained by this means. This was a very important work since not only are the tanks in the town a questionable source as regards quality, but they are also exposed to constant deficiency in point of quantity. In the *Dacca* town, it was arranged to close all the impure public wells in localities supplied with water from the hydrants. A suggestion by the Civil Surgeon to deal similarly with the private wells in houses in the same localities was negatived by the Commissioners on the ground that it would inflict great hardship on the families of the Mahomedans and Hindus. The proposition was therefore postponed till water can be introduced into their houses, to effect which the raising of a loan of a lac of rupees has been sanctioned. In the *Durbhanga* town, the worst of the stagnant tanks and pools, consisting of 232 dahras or small tanks and 115 pools, hollows, and depressions, were cleared out at the expense of their owners. A scheme for the supply of filtered water to the town of *Bhagulpore* has so far progressed that the first sod on the site of the proposed works was cut by His Honor the Lieutenant-Governor in November last. The Divisional Engineer is preparing the necessary plans and estimates, and there is every prospect of the work being carried to speedy completion. A bund with open stone causeways has been constructed at Buddia in *Godda* in the Sonthal Pergunnahs district, with the view of forming an artificial lake for the supply of water to the neighbouring villages.

Tanks provided in special localities.

New tanks were excavated, and the existing ones either re-excavated, cleared out, or improved, and foul and stagnant ones filled up in the following towns:—

Towns.	Districts.	No.	Remarks.
Culna ...	Burdwan ...	1,	Newly excavated.
Tumlook ...	Midnapore ...	1,	Re-excavated.
Midnapore		1,	Filled up.
Khanakool	Hughli ...	...	Improved.
Serampore	Serampore ...	1, 2,	Re-excavated. Ghats supplied.
Suburbs of Calcutta (Kalighat)	24-Pergunnahs ...	1,	Re-excavated.
Barripore...	Ditto ...	1,	Ghat supplied.
Santipore...	Nuddea ...	10,	Bathing ghats.
Dinagepore	Dinagepore ...	1, 1,	Ghat re-constructed. Set apart for drinking.
Pubna ...	Pubna ...	2, 1,	Newly excavated. Ghat supplied.
Kurseong Darjiling	Darjiling ...	... 2, 1,	Improved. Newly excavated. Watering trough.
Goalundo ..	Faridpore ...	1,	Newly excavated.
Perozepore	Backergunge	1,	Ditto.
Sudharam...	Noakholli ...	1,	Set apart for drinking.
Sitamurhi	Mozufferpore	1,	Reservoir for watering streets.
Durbhanga Roserah ...	Durbhanga...		Not stated.
English Bazar ...	Maldah ...	1,	Newly excavated.
Ranchi ...	Lohardugga	1, Not stated.	Deepened. Set apart.

Wells provided in special localities.

New wells were sunk, or the existing ones were improved generally, &c., in the following towns:—

Towns.	Districts.	No.	Remarks.
Burdwan ...	Burdwan	1	Sunk.
Bankura ...	Bankura	1	Improved.
Meherpore ...	Nuddea	Not stated.	Sunk.
Kishnaghur ...	Ditto	Ditto ...	Do.
Bogra ...	Bogra	1	Do.
Chunari ...	Shahabad	Not stated.	Do.
Jehanabad ...		1	Do.
Durbhanga ...	Durbhanga	8	Do.
Revilgunge ...	Sarun	2	Do.
		1	Do.
		Not stated.	
		1	Kutcha, converted to pucca.
Monghyr ...	Monghyr	1	Sunk.
Jamalpore ...		Not stated.	Pits constructed.
Purneah ...	Purneah	2	Cleared out.
Sahebgunge ...	Sonthal Pergunnahs ...	1	Sunk.
Balasore ...	Balasore	1	Do.
Purulia ...	Manbhum	1	Do.

In Districts.

In *Manbhum* the construction of the embankment and other works connected with the Govindpore Lake are being expedited; and the reports show that tanks and, in a few cases, wells were constructed in the following districts. Those provided by private individuals are distinguished from the others:—

Districts.	Localities.	Number of Tanks or Wells, &c.	Cost.	Names of the Private Individuals at whose cost they were constructed.
			Rs.	
Bankura ...	In different places	1,095 tanks ...	Not stated	......
Midnapore ...	Gurbetta police station	1 tank	250	......
	Rughoonath ,, ...	2 tanks	50	......
	Moisadal ,, ...	1 tank with pucca ghat.	7,100	......
	Sootahatta thanah	1 reclaimed... ...	80	......
	Salbooni police station	1 well	10	......

Balasore ...	Ditto	9 tanks, 3 wells ...	1,183	Names not mentioned.

DISPOSAL OF THE DEAD.

In Towns.

Burial grounds were established at *Soori* in Birbhum for Christians, and at *Pubna, Serajgunge, Julpaiguri, Dacca, Gya, Chupra, Durbhanga* and *Poori* for Mahomedans. *Burning ghats* were opened out at *Julpaiguri* and *Gya.*

MARKETS AND SLAUGHTER HOUSES.

In Towns.

Markets.

Two meat markets were in course of construction in the *Burdwan* town. Arrangements have been made to improve the Municipal Market in *Serampore* at a cost of Rs. 27,000, to meet which a public loan of Rs. 20,000 has been called for. A fish and general market has been started at *Pubna.* At *Darjiling* a meat market has been erected in front of the wood depôt in place of the old one. At *Gya* a grain market in Sahebgunge near the old jail, and a vegetable market, consisting of 8 tiled sheds, were under construction. At *Revilgunge* in Sarun, a market, called the "Eden Bazar" was opened out. At *Hazaribagh* a market shed has been constructed. At *Purulia* in Manbhum, a range of shops has been erected.

Slaughter houses.

These were constructed at *Arrah* in Shahabad, *Bhagulpore* and *Cuttack*, and a butcher's shop was opened out at *Durbhanga.*

PROTECTION TO TRAVELLERS.

In Towns.

Serais for the accommodation of travellers were constructed at *Burdwan*, and *Bettiah* in Chumparun (by the Maharajah of Bettiah), and additions to existing serais were made at *Chupra* in Sarun and *Purulia* in Manbhum. At *Darjiling* the square of the serai was metalled and its floor cemented.

In Districts.

Two sheds for travellers were erected at *Kalimpong* in Darjiling.

MEDICAL RELIEF.

In Towns.

Dispensaries were constructed at *Barrepore* in the 24-Pergunnahs and *Bettiah* in Chumparun. The Eden Sanitarium in *Darjeeling* for the reception of European patients, under a scale of graduated charges, is approaching completion, and was to have been opened out early in the current year. A thatched house and verandah were added to the dispensary at *Faridpore.* Four sheds at *Barisal* in Backergunge and one in *Sahebgunge* in the Sonthal Pergunnahs were provided for sick paupers. A new dispensary to replace the old one was being built by Mr. Dear of Monghyr. It will be provided with suitable wards for male and female Natives and Europeans and for opthalmic patients. Provision will also be made for insolation of contagious cases, an operating room, &c.

In Districts.

A dispensary was constructed by the Maharajah of Durbhanga on his estate at Parihar, in the *Madhubuni sub-division* in Durbhanga, and a hospital was in course of construction at Moisadal in the *Tumlook sub-division* in Midnapore.

OFFICE OF THE SANY. COMMR. FOR BENGAL,
The 20th June 1883.

F. W. A. DEFABECK,
Offg. Sany. Commr. for Bengal.

APPENDIX No. VI.

RULES FOR THE GUIDANCE OF THE OFFICERS OF THE VACCINATION DEPARTMENT, WITH REFERENCE TO THEIR VACCINATION AND SANITARY INSPECTION DUTIES.

Rules for the guidance of the Officers of the Vaccination Department, with reference to their Vaccination and Sanitary Inspection Duties.

In order that due and complete effect may be given to the instructions of Government directing that the officers of the Vaccination Department shall, in addition to their vaccination work, aid the Sanitary Commissioner in all branches of sanitary labour, the following rules are prescribed for observance by Deputy Sanitary Commissioners and their subordinates:—

I.—The Deputy Sanitary Commissioners shall, when inspecting the vaccination work of their subordinates, ascertain the number of operations performed by vaccinators (with due reference to the proportion of population with the number of already protected recorded in their registers), the character and the quality of the operations performed, and the amount and the merits of the work entrusted to Deputy Superintendents and Inspectors of Vaccination of all classes. They shall make it an important point of their duty to carefully ascertain, as far as possible, what number of children were born in the village during the year prior to the time of their visit, and whether they have all been vaccinated or not, and to take steps for having the unprotected vaccinated as speedily as possible. They shall use every reasonable endeavour, by explaining to the members of municipal committees, village headmen, natives of influence and position, and the people generally, the nature, objects, and benefits of vaccination, and by invoking the aid of the civil and police authorities, in cases in which opposition is offered, to promote vaccination by all legitimate means, noting the steps taken in this direction by their subordinates, and the progress made in villages inspected.

II.—They shall also, when visiting a village or town, inquire into its sanitary condition and carefully record any sources of insalubrity affecting the health of the people, together with such remedies as, in consultation with the Civil Surgeon, they may recommend for their mitigation. Their inquiries should be directed towards—

(1) *Topography.*—The situation of the village or town, with reference to its elevation or otherwise above the surrounding country, its proximity to rivers, nullahs, lakes, jheels, or marsh lands; to terai or swampy tracts of rice cultivation; to forests or areas of jungle land; to mountain ranges or high lands from which it is liable to be flooded during heavy rains—and special note should also be made of the character of the soil, its permeability, its capacity for the retention of moisture, and its power of absorbing and radiating heat. Special notes on climate and meteorology may be referred to under this head.

(2) *Population.*—Noting the number of inhabitants in general, as also their proportion in regard to sex and caste; its density with reference to means of accommodation, the habits of the people, and their chief occupations.

(3) *Dwellings.*—Describing their mode of structure, condition, proximity, and arrangements in regard to external perflation and internal ventilation, means of preserving them from ground damp and rain, and their capacity with reference to the numbers inhabiting them; their state of cleanliness, and the means adopted for removal of sewage and refuse. This also includes the housing of cattle.

(4) *Roads and Streets.*—As to their sufficiency for the objects of free perflation and to the condition of their side drains—whether deep, shallow, sufficient in fall, liable to obstruction—and whether they are used as latrines by the inhabitants.

(5) *Water-supply.*—Its sources, quality, and sufficiency, specially noting any probable causes of pollution:—(*a*) If from rivers, that no objectionable circumstances exist above stream to influence the water, no drains falling into them, no washing or bathing ghâts, no tanneries, dye-works, slaughter-houses, and similar sources of pollution; that precautions exist for the exclusion of such operations to the down-stream side, and for the drawing of water for drinking purposes only from above the town or village. (*b*) If from tanks, that a certain and sufficient number be specially isolated for supplying drinking-water, selecting only those likely least to suffer from contaminating causes; that these be specially protected from being used by the inhabitants for any other purpose than that of supplying drinking-water; that their sides be sufficiently raised to prevent any kind of surface drainage flowing into them; that no causes likely to pollute the water through filtration exist anywhere within dangerous distance of them; and that they be protected from falling leaves and other decaying vegetable matter. (*c*) If from wells, that the cone of percolation* be kept perfectly free from any contaminating cause; that no bathing, washing, or filthy habits of any sort be permitted near them; that their mouths be protected from access of accidental animal or vegetable substances; and that their margin be surrounded with an effective parapet to prevent inward drainage.

(6) *Conservancy.*—Including modes adopted for the disposal of sewage and other refuse matters, of dead cattle, offal from slaughter-houses, and similar immundicity, with careful observation of the efficiency or otherwise of public or private latrines.

(7) *Disposal of the dead.*—With reference to position of burial grounds and burning ghats, especially as to their proximity to sources of drinking-water, sufficient capacity of grave-yards, and the custom sometimes prevailing of burying the dead in private enclosures.

(8) *Food.*—In relation to its nature, supply, and quality.

(9) *General health.*—Noting especially any causes which appear injuriously to affect the physique of the population.

Although inspection should always be as searching as possible, it is not intended that full notes embracing all the above details should be recorded in every report submitted to this office. The first report on any place visited, however, should be complete in this respect, and it will be sufficient that reference be made in all subsequent reports to this initial one. Alterations or modifications of any kind which may occur between periods of inspection should always be carefully recorded.

III.—They shall, wherever possible, point out to the people defects in sanitation that obtain in any village or town, and the probable result of such defects on their health; they shall persuade them to rectify those susceptible of individual removal, and to abandon all practices which tend to produce unhealthiness.

IV.—In cases of epidemic or severe prevalence of any disease, they shall, after ascertaining its general history, distribution, duration, severity, and subsidence, the causes, exciting and predisposing, to which it is referable, and how far these causes are traceable to particular local insanitary conditions, specially with regard to conservancy, drainage, water-supply, or any of the conditions before named of the houses or localities in which the disease is present, at once address the local district officers direct on the subject, noting the insanitary conditions to which the disease is referable, and offering such recommendations as they may consider needed for arresting the progress of the disease and correcting the sanitary defects observed. A copy of this representation should, simultaneously, be sent to the Sanitary Commissioner.

V.—Whenever, owing to an undue prevalence of any disease within the limits of the circle of a Deputy Sanitary Commissioner, he is called upon by the Sanitary Commissioner, or by the local district officers, to inquire into the matter, he shall proceed to the locality, investigate the circumstances, and record the facts in regard to the disease in question in the manner prescribed in Rule IV, and submit a report to the Sanitary Commissioner of the results, with recommendations as to the remedial measures that ought, in his opinion, to be adopted. If owing to any *valid* reason the Deputy Sanitary Commissioner is unable to perform this duty himself, he shall depute his Deputy Superintendent of Vaccination to perform it. The Deputy Superintendent's report should be forwarded to the Sanitary Commissioner by the Deputy Sanitary Commissioner with his remarks thereon, and an explanation shewing the cause of the transference of the inquiry.

VI.—The Deputy Sanitary Commissioners and the Deputy Superintendents of Vaccination shall, when visiting a village, ascertain and note carefully the number of births and deaths that have occured in it during the three months prior to the date of visit, the class and sex of the number born, and the class, sex, and age of the deceased. They shall as soon as possible after this, compare the information obtained with the entries in the registers kept up in the thannah, outpost, or registering circle, to which the village is subordinate. In places where the chowkidars keep memorandum books of births and deaths, the entries in them should also be verified by inquiry on the spot. When visiting a municipal town or a circle to which the Compulsory Registration Act IV (B. C.) of 1873, has been extended, they shall ascertain how the law is being worked, and describe its influence on registration.

VII.—They shall, on visiting any town or other area to which either the Compulsory Vaccination Act V (B. C.) of 1880, or the Act IV (B. C.) of 1865, prohibiting inoculation, or both, have been extended, ascertain how these laws have been worked, and how far the former has promoted vaccination and the latter suppressed inoculation.

VIII.—Every officer in the Vaccination Department shall make himself fully acquainted, with the provisions of the Compulsory Vaccination Act V (B.C.) of 1880; of Act IV (B.C.) of 1865, prohibiting inoculation; of Act IV (B.C.) of 1873, rendering the registration of births and deaths compulsory; and of any laws affecting vaccination, inoculation, and the registration of births and deaths, that may hereafter be enacted: and every Inspector of Vaccination and Inspecting or Head Vaccinator shall make himself thoroughly acquainted with the instructions contained in Dr. Cuningham's Sanitary Primer for Indian Schools.

IX.—No person shall be appointed an Inspector of Vaccination or an Inspecting or Head Vaccinator unless he shall have passed a satisfactory examination in elementary hygiene; and all officers of these classes who are now on the staff shall pass a similar examination within six months from the date of notice to this effect, to be given to them at once by the Deputy Sanitary Commissioners. These examinations shall be conducted by the Deputy Sanitary Commissioners, and a report of the results in each case shall be submitted by them to the Sanitary Commissioner. After these officers shall have passed this examination, they shall perform the duties prescribed in Rules 1, 2, 3, 6, and 7.

X.—The Deputy Sanitary Commissioners and the Deputy Superintendents of Vaccination shall keep a Monthly Diary, shewing in full detail the vaccination and sanitary work performed by them under every head prescribed in the foregoing rules. These Diaries should be forwarded to the Sanitary Commissioner as soon as possible after the close of the month to which they relate, the Diaries of the Deputy Superintendents of Vaccination being sent through the Deputy Sanitary Commissioners, with remarks of the latter on the observations, &c., recorded therein. The reports of the Inspectors and Inspecting or Head Vaccinators should be similarly treated.

DIARY OF VACCINATION AND SANITARY WORK PERFORMED BY OF THE CIRCLE DURING THE MONTH OF 188 .

Date of visit.	Names of villages and towns visited.	Districts and thannahs in which the towns and villages are situated.	Population of the villages and towns.	Vaccination work performed, as per Rules 1 and 7.

Sanitary work performed, as per Rules 2, 3, 4, 5, and 6.	Numbers and dates of letters forwarding special reports to the local district officers and to the Sanitary Commissioner.	Remarks.

APPENDIX No. VII.

FURTHER REPORT SHOWING THE RESULTS OF THE ANALYSIS MADE IN DACCA ON DRINKING WATER.

Report on the analysis of drinking water at Dacca, by Dr. A. Crombie, Civil Surgeon of Dacca.

"I forward a letter which I addressed to the Municipal Commissioners, giving the results of the analysis which had been made of the well and hydrant water since July 1881, and I append a tabular statement showing the actual results of each analysis of each water. These show the immense superiority of the river and hydrant water, and the poisonous quality of the well and tank water. With regard to the hydrant water, it is evident that it was not so pure in July and September 1881 as in November, March and April 1882, and that in fact in September 1881 it was not fit for distribution on account of sewage contamination. The cause of this liability to contamination is not far to seek. The bottom of the filtering beds is nine feet below the surface of the ground, and they are so built as to be freely pervious to water. When therefore the sub-soil water (which is only partially diluted sewage in Dacca) rises above nine feet, *i.e.*, from the middle of June to the end of October, it is liable to pass into the filtering beds and so into the reservoir of filtered water. As a result of my letter to the Commissioners, a Municipal Committee, consisting of myself, the Chairman, and the Executive Engineer, was formed to enquire into this leakage. We made an experiment which, showed that when one filter bed was full and the other empty, the sub-soil water outside the full filter bed rose to 5 feet higher than it stood opposite the empty one, showing the most perfect interchange to be possible between the soil and the filter beds. I find that the reservoir of filtered water has now been made waterproof. I however also discovered that the main suction pipe from the river as well as the suction pipe from the settling tank leaked, and they too are therefore capable of sucking in sub-soil water whenever it rises to their level. The report of the Sub-Committee has not yet been submitted, but there is no question of the urgent necessity of taking up the filtering material and making the filtering beds as waterproof as it is now possible to do.

"With regard to the wells, the Municipal Commissioners found it impossible to accept my proposition to close all wells, public and private. This could not be done without introducing hydrant water into every house, and this at present is not practicable. But they agreed to close all public wells in the line of the hydrants, and also to close all cess-pools, both public and private, which is a resolution of very great importance, because the impurity of the well-water is dependent on the innumerable cess-pools generally close to the wells."

Results of Analysis expressed in parts per 100,000.

	Dates.	Total solid matter.	Chlorine.	Free ammonia.	Albuminoid ammonia.	Nitrogen, or nitrates and nitrites.	Previous sewage contamination.	Hardness, Clark's scale. Total hardness.	Temporary.	Permanent.	Nitrates and nitrites.	Behaviour of total solid residue on ignition.	Poisonous or other metals.

No. 812, dated the 6th December 1882.

From—Dr. A. Crombie, Civil Surgeon, Dacca,

To—The Chairman of the Municipal Commissioners, Dacca.

"I have the honour to forward herewith copies of the results of analyses [see above table] which have been made from time to time by the Chemical Examiner to Government of the hydrant and well-water of Dacca, specimens of which have been sent to him for that purpose at intervals of a few months since July 1881.

"*The hydrant water.* This was examined five times. The total solids never exceeded 40 parts per 100,000 which is the limit of fairly good water. On two occasions, however, there was slight blackening on ignition of the solids, showing the presence of a small quantity of

organic matter. On all occasions the albuminoid ammonia (*i.e.* ammonia existing in composition in the organic matter present) was in excess of the quantity that ought to exist in tolerably pure water.

"Chlorine was never in excess of the proportion that may exist in unpolluted water. Nitrogen, which is an index to oxidised excreta, was on one occasion in quantity that showed considerable pollution. The heading "previous sewage contamination" shows the number of parts of London sewage, which contains the same quantity of nitrogen as 100,000 parts of the water under report. On one occasion there was none; on two occasions there was about ¼ per cent. of sewage in the water; and on one occasion there was nearly 6 per cent. of sewage in the hydrant water. On that occasion, on the 6th of September 1881, there were 35 parts of solid matter which was charred on ignition, ·009 of albuminoid ammonia, and the previous sewage contamination was represented by 5,850 parts of filtered London sewage in 100,000 parts.

"It is evident that on that date the Dacca hydrant water was highly polluted and not fit for consumption, and the cause of the pollution in all probability, as was pointed out by Dr. Purves who was then acting Civil Surgeon, was leakage of sub-soil water into the reservoir of filtered water at the Water Works. I am credibly informed that this reservoir has been so badly made that it cannot be emptied; that whenever an attempt was made to empty the reservoir there always remained two feet of water in it from leakage into it of sub-soil water; and that to prevent this leakage into the reservoir, it is always necessary to keep a head of water in the reservoir and so cause a leakage *outwards from* the reservoir into the surrounding soil. On the 6th of September there was a sudden rise of the sub-soil water-level to within three feet of the surface of the ground, and the consequence was that, the sub-soil water headed the water in the cistern, and there was leakage *into* the reservoir, and the diluted sewage which the sub-soil water always contains was distributed over the town. This is a dangerous accident which is constantly liable to happen, and, in my opinion, this faulty state of the reservoir deserves the most urgent attention of the Commissioners.

"Comparing the hydrant water with the river water, of both of which specimens were sent on the 9th of November 1881, I find that they are practically indentical, the diminution of the organic impurities in the hydrant water being very slight. The filtering medium used is not calculated to remove other than mechanical impurities (*i. e.*, matters in suspension, not in solution), and it is satisfactory to find that the process of filtration does not add to the organic impurities already existing in solution in the river water—a result which is most likely to occur unless great attention is paid to the periodic cleansing and renewing of the filtering beds.

"Passing to the consideration of *well-water*, I take first the large well at the Jail. This is a pucca well surrounded by a parapet and boarded over, and not in the immediate vicinity of any cess-pool. It is, therefore, more favourably situated and protected against pollution than any other well in Dacca. In fact it may be taken as containing Dacca sub-soil water free from accidental contamination. Yet it contained on two occasions 62 and 64 parts of solids in 100,000, 40 being the limit, and on the third occasion the solids were 39·4. The chlorine, which ought not to exceed one part, and is the best index of the presence of excreta, especially urine, existed to the extent of 5·8, 7·7, and 8 parts in 100,000. The ammonia, and nitrates and nitrites, were always in excess of the potable standard; and on one occasion it contained 10 per cent. and on another 12 per cent. of sewage matter. Since these analyses were made, the use of this well for drinking water in the Jail has been prohibited, as it is obviously perfectly unfit to be drunk. Nevertheless this is by far the best well in Dacca.

"Taking next the large pucca well at the Begum Bazar musjid, a well which enjoys a great reputation in the neighbourhood, I find that the total solids were 81, 96 and 103 on the three occasions on which it was examined, the limit of potable water being 40. The chlorine was 9, 8 and 13 instead of 1, and the previous sewage contamination amounted to 11,000, 15,000, and 47,000 parts per 100,000. This means that if a pint of filtered London sewage were taken and a little more than a pint of pure water added to it, the mixture would have the same composition as the fluid which the inhabitants of Begum Bazar habitually drink. It is obvious that such a fluid is not fit for use as a substitute for drinking water, and this well ought to be closed.

"It is needless to go over the analysis of each well in this way. The accompanying tables show that they are all unfit for use. Peary Mohun Shah's well contains from 105 to 135 parts of solid water, 10 to 15 parts of chlorine, and from 24 to 47 per cent. of sewage matter. It ought also to be closed at once.

"Chand Khansamah's tank at Amligola is not so impure, containing less than 40 parts of solids, 4 parts of chlorine, and 1 to 2 per cent. of sewage matter. Purana Mogul Taly well contains 64 to 86 parts of solids, 10 or 11 parts of chlorine, and 4½ to 17 per cent. of sewage matter. It is also quite unfit for use.

"If such is the condition of the large public wells, what must be the state of the thousand private wells in almost every house in Dacca within a few feet of a large cess-pool, if not in the same courtyard, just over the wall? Cess-pools are never emptied, and yet they do not overflow. They rise and fall with the level of the sub-soil water, which has an annual tide of 15 feet. When the rivers fall at the end of October, so does the sub-soil water, and so do the cess-pools and the adjoining wells—and there is a free interchange of contents between them all over Dacca, through the intervening porous sub-soil. At other seasons, when the wells are always being emptied and the cess-pools filled, the interchange is more one-sided, *i.e.*, it must

always be from the cess-pool to the well Hence it is that all wells sunk in the sub-soil of Dacca must be, as the Chemical Examiner shows they are, mere collections of filtered and diluted cess-pool contents.

"It may be objected that if the well-water which is habitually drunk by thousands of the inhabitants of Dacca is so utterly unfit for use, how is it that any of the people continue to live in good health. It must be remembered that impure water is not so much an actual as a potential danger. People may go on drinking diluted sewage with comparative impunity, until that diluted sewage happens to contain the "germs" of disease, *i.e.*, until it contains the stools of cholera patients, when we get such an outbreak as we had in July and August of this year, each cholera patient's stool gradually passing into his neighbour's well.

"The practical conclusions which I wish to place before the Municipal Commissioners are, first, that the imperfect state of the reservoir of filtered water at the water works be remedied, and, secondly, that every cess-pool and every well, both public and private, be closed, beginning with the wells situated in those parts of the town supplied with hydrant water, and with the cess-pools situated where it is possible to adopt the privy system at once.

"I append a table showing the averages of the different waters analysed, for easy comparison":—

	Total solids.	Chlorine.	Free ammonia.	Albuminoid ammonia.	Nitrogen as nitrates and nitrites.	Previous sewage contamination.
LIMIT OF— Potable water	40·	1·0	·01 to 2·0	·008	0·5	Nil.
River ditto	10·	0·26	·002	·008	0·42	116
Hydrant ditto	15·	0·41	·003	·006	0·17	148
Jail well	53·	7·18	·010	·015	0·86	8,498
Begum Bazar well	93·7	10·48	·031	·029	2·48	24,716
Peary Mohun Shah's well	120·6	13·00	·0038	·008	3·63	36,067
Chand Khansamah's tank	35·8	4·25	·065	·043	0·169	1,829
Purana Mogul Taly well	75·6	10·94	·010	·015	1·148	30,712

Extract, paragraph 8, from the Proceedings of the Municipal Commissioners at a Meeting held on the 12th January 1883.

Paragraph 8.—"Considered the memorandum from the Civil Surgeon regarding the Chemical Examiner's analysis of the hydrant and well-water of Dacca. Resolved that a Sub-Committee, consisting of the Chairman, the Executive Engineer, and the Civil Surgeon, be asked to enquire and take measures to remedy the imperfect state of the reservoir of filtered water at the Water Works, and that the Civil Surgeon's suggestions to fill up all cess-pools and "*gors*" be adopted.

"Proposed by the Chairman and seconded by the Vice-Chairman, that the Secretary's suggestion of issuing notices on all alleged owners or occupiers of houses or lands surrounding cess-pools, either to close them or to disown ownership of some, be adopted, and that such notices be issued on all owners or occupiers of houses and lands that surround cess-pools and filthy tanks commonly called "*gors.*"

"With regard to the closing of private wells, the native gentlemen of the Committee present being of opinion that the wells in private houses even adjacent to hydrants now existing should not be closed, it was resolved that the impure public wells only on the line of the present water-supply be closed, and that the Civil Surgeon be requested to give a précis of his above letter, which should be translated and widely circulated in the town."

Remarks by the Sanitary Commissioner for Bengal.

I ENTIRELY concur with the remarks made by Dr. Crombie, and would recommend the Municipality unceasingly to endeavour to give effect to his propositions regarding remedies to be applied to the defective reservoir for filtered water, and for closing all private cess-pools and wells. With the public ones they ought to be able to deal at once and completely. The existence of these wells and cess-pools is a continual menace to the salubrity of the town, and an invitation for fatal invasion of any wave of epidemic disease which may happen to pass over the population.

APPENDIX No. VIII.

ABSTRACTS OF INSPECTION REPORTS ON TOWNS VISITED IN 1882.

Abstracts of Inspection Reports on Towns visited in 1882.

Meherpore.—*Inspected in January.*—Very grave sanitary defects were found to exist in this Municipality, of which the chief are the following: The town is badly kept, being overgrown with jungle, and full of pits containing foul water in which bamboos are steeped. The drainage is very defective, the roadside drains being often unconnected and ending in pits which, being undrained, allow the water to soak in and evaporate. Several of the drains are also deep and dangerous. The conservancy arrangements were much neglected; the establishment altogether insufficient, and the streets unswept. There is not a single public latrine; the private ones consist, for the most part, of well-privies, which are only cleaned when full to the brim; the other privies are not cleaned even once in 10 years; and defœcation is permitted anywhere and everywhere. The reserved tank and wells were not properly looked after, the banks of the former being resorted to for defœcation; the private tanks and wells were in a bad condition, being used promiscuously for all purposes; and the river Bhyrub, the water of which is also used for drinking and other purposes, was in a frightful condition, its banks being very foul, and corpses thrown into it just at the fishing weir above the town. The arrangements connected with the disposal of the dead were also very unsatisfactory, no appointed burial-ground existing, interment within the enclosures of houses or in the fields outside the town, being the rule, and the pauper dead being conveyed to some garden, and simply left there.

The recommendations were:—(1) To utilize the expenditure on account of the Police, which is no longer to be charged to the Municipality, in correcting sanitary defects. (2) To consider the advisability of introducing Parts VII and VIII of the Bengal Municipal Act into the town. (3) To repair the roads, uproot jungle, remove the projections over the drains, and fill up the numerous pits. (4) To give effect to the proposed drainage scheme as early as practicable. (5) To provide a sufficient number of public latrines, and to check the practice of promiscuous defœcation. (6) To cause the streets to be regularly swept, and to utilize the sweepings in filling up the pits. (7) To suppress the well-privies, and to induce their owners to provide in their place properly constructed surface privies. (8) To have the private privies cleaned by municipal mehters on the Burdwan plan, and the night-soil buried on the Monghyr plan. (9) To remove the tannery, kilns, and the skinning and disemboweling of animals, beyond municipal limits. (10) To set apart more tanks for drinking purposes; to protect the reserved tank and the river Bhyrub effectually from pollution of every kind; to induce the people to keep their tanks and wells in order, and guard them from surface pollution; and to strictly prohibit the practice of throwing corpses into the Bhyrub. (11) To provide a burial-ground for Mahomedans outside the Municipality, and to stop the practice of intramural interments; to establish a burning ghât under municipal management and enforce complete cremation; to provide a burial-ground for Christians; and to see that the pauper dead are properly disposed of at the cost of the Municipality. (12) To adopt steps for the introduction into the town of the Compulsory Vaccination Act. (13) For the improvement of registration, to utilize the provisions of the Compulsory Registration Act, (which is in force in the town), particularly its penal clause; to cause the Tax Darogah to ascertain and report deaths, and to adopt the use of trifoil cheque-books.

Action taken on the suggestions:—The utilization of Parts VII and VIII of the Bengal Municipal Act was approved by the Municipal Commissioners, but their introduction was suspended, pending approval by the Commissioner of the Division. The delapidated drains were repaired, and the deep pits filled up; but their thorough improvement was deferred until the introduction of the proposed drainage scheme. Much of the jungle on the sides of the public roads and lanes was removed by the Municipality; and notices were served on the rate-payers to clear away the remainder within a specified time. The filling up of the pits was considered to be a difficult matter, inasmuch as, considering their large number and dimensions, it would be futile to ask the people, who are generally very poor, to fill them up, or to expect the Municipal Commissioners to undertake the task, the funds at their disposal not being sufficient for the purpose. Effect could be given, it was said, to the proposition, by utilizing the street sweepings, but as almost all the streets in the town are kutcha, it was considered useless to sweep them. The Commissioners, however, propose when, under the operation of Part VII of the Act, the refuse and rubbish of houses are removed, to utilize these in filling up the pits. Owing to the town being a large one and requiring 40 sets of latrines for the 40 sections, situated at long distances from one another, into which it is divided, to the cost of mehters being great owing to their having to be imported, and to the amount hitherto allotted for the Police having been set aside to meet the cost of the drainage scheme, and other public works, the Commissioners do not find themselves in a position to provide public latrines, and thus prevent the poor from defœcating everywhere. They are, moreover, of opinion that the system of public latrines should not be introduced into the Municipality "to the utter exclusion of all its higher and nobler purposes." Provision has been made in the budget for an establishment for cleaning the private latrines, and it has been determined to abolish all the well-privies. Arrangements have been made to provide burning ghâts and burial-grounds, and to improve the municipal tank.

Mohespore.—*Inspected in February.*—Many sanitary defects were found to obtain in this town. The roads are unmetalled and encroached upon; the drainage is defective; the conservancy arrangements are very unsatisfactory; there are no municipal markets or slaughter-houses; the water-supply arrangements are sorely in need of improvement; there are no municipal burial-grounds or burning ghâts. The income of this town has hitherto been too small for carrying out any appreciable sanitary work; but as the cost of the Police will for the future not be a burden to the Municipality, it is expected that a substantial sum will be available yearly for correcting the above defects.

The suggestions were:—(1) To frame and bring into operation a code of bye-laws in order to give force and effect to the sanitary clauses of the Bengal Municipal Act. (2) To remove the encroachments on the roads, and fill up the filthy pools, which abound in the town, with street sweepings, the streets being regularly swept, which is not done at present. (3) To give early effect to the drainage scheme under consideration. (4) To provide a sufficient number of public latrines. (5) To induce the owners to do away with well-privies, and to provide in their place properly constructed surface privies. (6) To have all the private privies cleaned by municipal mehters. (7) To take up ground for trenching night-soil. (8) To increase the conservancy establishment, importing mehters for the purpose. (9) To select, reserve, improve and effectually protect from all pollution some of the tanks in different parts of the town. (10) To strictly prohibit resort to the banks of the river for purposes of defœcation. (11) To appoint a burial-ground for Mahomedans outside the town, insist on their using it, and stop all intramural interments. (12) To cause the Registrar to test the mortality returns furnished by the Police when going his rounds. (13) To consider the desirability of utilizing the Compulsory Registration Act IV (B.C.) of 1873 for the improvement of registration.

Action taken on the suggestions:—It was reported that a pucca drain had been made along the Sudder Road and that it was in contemplation to extend the same next year; that the latrine system was about to be introduced; that lands had been set apart for a burial-ground and a burning ghât; that the conservancy establishment would be strengthened by the importation of two mehters; that notices had been served requiring the removal of all noxious vegetation; and that allotments had been made in the Budget for re-excavating one or two tanks, and for generally improving the sanitary condition of the town as far as possible.

Santipore.—*Inspected in March.*—Very grave insanitary conditions were found to obtain in this town. The drainage is defective, in fact the town is almost devoid of regular pucca drains. Only surface cleansing is attended to. There are no public latrines; the private ones are merely well-privies, which are only cleaned when nearly full; the poor resort to every ditch, waste place, jungle or convenient corner hidden from observation. The markets are very inadequately drained and are unprovided with water and latrines; offensive and dangerous trades were carried on within municipal limits. The arrangements connected with the water-supply and disposal of the dead are as bad as bad can be. No tanks are set apart for drinking purposes and no wells provided for public use, the private tanks, as well as the river, being unprotected from surface drainage and other pollution, and their banks being invaded by jungle and resorted to for defœcation. No burial-grounds for the Mahomedans and Christians are provided; the pratice of interment within the enclosures of houses is general; and burials close to the riverside are carried on by the Boistubs.

Suggestions offered:—(1) To devise means for raising the expenditure, so that funds may be available for sanitary purposes, and to utilize, for the same purpose, the large sum hitherto paid for the Police, but which has become available for sanitary uses under the orders of Government on the subject. (2) To administer the sanitary laws with the needed activity and completeness, and to frame and bring into operation a code of bye-laws by which to emphasize their effect. (3) To carry out, as soon as possible, the proposed drainage scheme; and, in doing so, to avoid deep drains, providing instead sufficiently wide saucer-shaped ones. (4) To provide an adequate number of cheap public latrines situated in convenient and accessible positions, those for females being separate from those for males; to suppress the well-privies, causing their owners to provide in their place properly constructed surface privies; to have the private privies, when constructed, cleaned by municipal mehters, according to the Burdwan arrangements. (5) To bring into operation the Latrine Act VI (B. C.) of 1878, in order that the cleaning and supervision of both public and private latrines may be effectually carried out. (6) With the establishment of these latrines, to make arrangements for trenching the night-soil on the plan followed in Monghyr. (7) To strengthen the establishment, and to maintain night-soil carts, in order that the conservancy arrangements may be efficiently carried out. (8) To provide a slaughter-house. (9) To prohibit the carrying on of dangerous and offensive trades within municipal limits. (10) To set apart a sufficient number of tanks, removed some distance from the river, for drinking purposes, and to have them embanked against surface pollutions and effectually guarded from employment for other than drinking purposes; to provide some public wells, protected with parapets and supplied with platforms communicating with the nearest drains, so as to preclude washings or refuse of any kind re-entering the wells; and to take great care to see that the river is kept free from pollution, adopting measures for detecting and punishing offenders. (11) To establish burial-grounds having sufficient accommodation to meet the entire requirements of the Mahomedan community, and when these grounds are established, to take steps to entirely suppress the practice of interment

within enclosures of houses or in other places than the burial-grounds themselves; to provide also a burial-ground for Christians; to prohibit the practice of burying the dead close on to the river prevalent among the Boistubs; to dispose of the pauper dead through municipal agency; and to prohibit the murdafrashes from appropriating to themselves the clothes of those who die from cholera, small-pox, or other infectious diseases. (12) To utilize the provisions of the Compulsory Vaccination Act. (13) To consider the advisability of providing a hospital for contagious cases and accommodation for the houseless poor and the aged. (14) To accord special attention to the very defective registration of births and deaths, and to improve it by the means suggested, fully utilizing the provisions of the Compulsory Registration Act, which law has to all intents and purposes, been a dead letter since its introduction in 1875.

Action taken on the suggestions:—No report received, except that it was resolved that as no license had been taken out for the lime kiln complained of, its continuance be disallowed.

Beernugger.—*Inspected in March.*—This town is rapidly going to ruin; homesteads are deserted; jungle prevails; and grave defects involving the conservancy and the water-supply obtain. No bye-laws, framed under the Bengal Municipal Act V of 1876, has been brought into operation. The sanitary clauses of the Municipal Act do not appear to be administered fully and actively. The roads are neglected, and jungle and rank vegetation abound. A proper system of drainage is another great want. The conservancy establishment appears to exhaust its energies in only looking after the drains. The poor defæcate anywhere and everywhere. The drinking water-supply arrangements call for urgent attention. The formation of a burial-ground is immediately necessary, and it is suspected that burials within enclosures of houses is practised.

Suggestions offered:—(1) To devote the amount hitherto defrayed for Police to sanitation. (2) To accord serious attention to the defects under the heads of conservancy, water-supply, &c. (3) To frame and bring into operation bye-laws in connection with the Municipal Act. (4) To uproot all jungle and remove all rank vegetation. (5) To level the drains falling into the Baromashia khal. (6) To provide a sufficient number of public latrines. (7) To prevent the people from defæcating anywhere and everywhere. (8) To cause the streets to be daily and properly swept, the sweepings being utilized in filling up excavations. (9) To suppress all well-privies. (10) To induce the people to provide for themselves properly constructed surface privies. (11) To cause all private privies to be cleaned by municipal mehters. (12) To take up ground for trenching the night-soil. (13) To adequately increase the establishment in order that the conservancy arrangements may be satisfactorily carried out. (14) To remove all stable litter. (15) To provide a municipal market and a slaughter-house as soon as funds permit. (16) To take steps to embank and reserve the two tanks which had been pointed out as the most suitable for drinking purposes. (17) To ascertain whether interment and cremation do take place within the enclosures of houses, and to stop the practice if it exists. (18) To utilize the provisions of the Compulsory Registration Act.

Action taken on the suggestions:—It was reported that a draft code of bye-laws was in course of preparation and would be ultimately submitted for approval; that the work of clearing the jungle was in progress; that some of the drains falling into the Baromashia khal had been excavated and levelled; that the introduction of a general latrine system was, at a meeting of the Commissioners, considered not feasible; that an increase to the conservancy establishment had been proposed, which would entail with it the sweeping of streets; that the necessary steps would be adopted to remove the stable litter complained of; that two tanks had been reserved for drinking purposes; that a site had been fixed for the interment of human remains; that stringent orders had been issued prohibiting burials within household precincts; that vaccine operations were in progress; that arrangements had been made for improving the registration; and that the remaining suggestions would receive attention when funds became available for the purpose.

Ranaghat.—*Inspected in March.*—The sanitary condition of this town was found to be, in several respects, very unsatisfactory. The drainage is defective; surface cleansing is insufficiently cared for; there are no public latrines; all the private latrines consist of well-privies; the people generally defæcate in places most convenient to themselves; the drinking tanks are unprotected from pollution.

The suggestions were:—(1) To devise means for raising the income, so that a sufficient allotment might be made for carrying out sanitary improvements, and to use, for the same purpose, the savings derived by the Municipality, having been, under orders of Government, relieved of the cost of the Police. (2) To administer the sanitary clauses of the municipal laws with greater activity than at present. (3) To carry out the proposed drainage scheme. (4) To provide a sufficient number of cheap public latrines, so that promiscuous defæcation may be obviated. (5) To suppress the well-privies, the owners being induced to provide in their place properly constructed surface privies. (6) To have these privies, when built, cleaned by the municipal mehters, according to the Burdwan plan. (7) With the establishment of public and private privies to make arrangements for trenching the night-soil on the Monghyr plan. (8) To have the streets swept daily. (9) To strengthen the establishment, so that the conservancy arrangements may be effectually carried out. (10) To consider the advisability of introducing the Latrine Act. (11) To induce the owners of the private markets to provide them with latrines. (12) To effectually guard the tanks reserved for drinking purposes from pollution, embanking them, and uprooting the jungles on their

banks, which is resorted to for purposes of nature. (13) To cause the owners of foul private tanks to put them into a wholesome condition under the provisions of the law on the subject. (14) To improve registration as per suggested instructions, and for the same purpose to fully utilize the provisions of the Compulsory Registration Act, which has been extended to the town.

Action taken on the suggestions :—It was resolved that the people be induced gradually to give up the well-privies; that the construction of new well-privies be disallowed in thickly-populated quarters of the town, unless, after due consideration of the locality in which they are proposed to be situated and their neighbourhood, it is deemed unobjectionable to permit their erection; that public latrines be constructed in different parts of the town; that notices be placarded prohibiting people from defœcating in places other than a public or private privy; that the conservancy establishment be strengthened and carts provided for sweeping the streets and attending to the latrines; that the scheme of having the private latrines cleaned by municipal mehters be gradually introduced; that application be made for the extension of the Latrine Act to the town; that the owners of the private markets be called upon to provide them with latrines; that the bank of the tanks be cleared of jungle and steps adopted for protecting them from pollution; that the owners of the foul tanks be called upon to put them into wholesome condition; and that ground be taken up for burying night-soil.

Kurseong.—*Inspected in September.*—Much commendable interest for the sanitary welfare of this town is evinced by the Municipal Commissioners, particularly with regard to building arrangements—and, it is said, that by the further application of the law relating to these arrangements, the town will soon improve in appearance and comfort. Among other improvements effected, a masonry tank for storing water was in course of construction, and a new water service will, it is expected, be opened out during the next cold season, when one great want of the town will be met to some extent. But there yet remain several sanitary defects that call for rectification, chief among them being the want of a proper system of roads, most of the existing ones being merely fair weather pathways, insufficient public latrines, and promiscuous defœcation.

Recommendations made :—(1) To more fully and actively utilize the sanitary clauses of the municipal laws, and to introduce a code of bye-law to emphasize their effect. (2) To apply, through the proper channel, for the exclusion, by legal enactment, of the large areas of forest and tea lands now included within the boundaries of the Municipality, where, it is said, it is difficult to exercise efficient municipal control for sanitary and other purposes. (3) To establish a proper system of roads. (4) To provide additional conveniently situated latrines, so as to prevent the people from resorting to the jungle and elsewhere for defœcation. (5) To strengthen the conservancy establishment, so that proper attendance both to surface cleansing and latrines may be ensured. (6) To lay down Portland cement on the floors of the existing latrines; to select a conveniently situated and sufficiently large site for trenching night-soil, and to cultivate the ground when manured. (7) To cause the private privies to be attended to by the municipal mehters, and to levy a fee for the service. (8) To bury the street-sweepings and rubbish instead of throwing them down the khud. (9) To require the owner of the private slaughter-house to cement its floors and drains, and to keep them in a cleaner condition. (10) To remove the tanneries beyond municipal limits. (11) To furnish the Police with notices of interments and cromations, so that registration and suspicious deaths might be more fully controlled. (12) Instead of continuing the present practice of including the vital statistics of the town with those of the thana to which it is subordinate, to keep up a separate record of them now that it has been constituted a Municipality, and to introduce into it the Compulsory Registration Act.

Action taken on the suggestions :—No report yet received.

Darjiling.—*Inspected in October.*—The sanitary defects found to exist in this sanitarium, the only one in Bengal, were very grave in character. I think it right, in order that a clear conception may be formed of their seriousness, to submit here, in extenso, my Inspection Report on this Municipality, with the suggestions which were offered for rectifying existing defects. Some of these suggestions viz. those mentioned on page lxxxvi have been attended to; the correctness and validity of some are disputed; and action will, it is said, be taken at future meetings with regard to the rest. The Municipality having now become fully alive to the existence of the defects pointed out, will, it is hoped, do all within its power to minimize them.

Population.—This is a first class Municipality containing, according to the last census, 7,018 inhabitants, distributed as follows :—

According to Sex.		According to Religion.	
Males	4,579	Christians	160
Females	2,439	Hindus	4,592
		Mahomedans	614
		Other races	1,652

2. *Municipal Income and Expenditure.*—The income amounted during the year 1881-82 to Rs. 62,325, including a balance in hand at the close of the preceding year of Rs. 2,680.

This amount was expended as follows:—

	Rs.
For Police	3,809
" Interest on loans	4,583
" Municipal establishment	3,403
" Conservancy ditto	9,954
" Maintenance and repair of roads	18,360
" Sanitation	5,705
" Vaccination	144
" Treatment of sick	1,665
Miscellaneous	10,343
Total ...	57,966

leaving a balance in hand at the close of the year of Rs. 4,359. The amount returned under head of sanitation was expended on—

	Rs.
Drainage works	3,411
Water-supply	2,294;

but it represents only 9·2 per cent. of the income, which is much too small a proportion to allot for so important a purpose out of the very appreciable revenue which accrues to the Municipality. No doubt the damage done to the roads by the heavy rains prevalent at Darjiling draws largely upon the municipal revenues for expenditure on repairs. Nevertheless it appears to me that, Rs. 18,000 is an unnecessarily large amount to devote to this purpose, considering that several other important works, to which reference will presently be made, remain still unprovided for. With careful economy, together with the utilization of the sum hitherto expended on Police, not now chargeable to the Municipality, sufficient funds ought certainly to be available for the most urgent sanitary improvements. Darjiling, which in point of site, of climate, of conditions of soil and water, of all its undeniably salubrious physical aspects in fact, is free from any kind of morbific influence, which can justly be attributed to either telluric or atmospheric causes, ought, in every respect, to justify its claim as a wholly reliable health resort for Calcutta, more especially so, as it is the only one which is readily accessible to the residents of the Metropolis. The place ought, therefore, to be kept free, as far as practicable, from all conditions likely to neutralise its many natural advantages; and, although there are evils which must necessarily arise wherever people congregate in considerable number, there appears to be no reason why these should not be as successfully combated at Darjiling as they are elsewhere.

3. *Operation of the Municipal Laws.*—The sanitary clauses of the Municipal Act and the bye-laws in operation appear to be only indifferently administered. Much greater activity is needed radically to suppress the many insanitary practices prevailing in this town. The suggestion made in the last Inspection Report for the extension to this Municipality of Act V (B.C.) of 1878, empowering the Commissioners to control the public and private latrines, and to levy a fee for supervising the latter, has not yet been thoroughly adopted. Further on it will be shown how great is the necessity for utilizing the provisions of this law.

4. *Roads.*—The condition of the roads is good. Lighting of some of these has been commenced, although only imperfectly. An endeavour was made to give effect to the suggestion made in the last inspection report regarding the improvement of the station by planting indigenous flowering and natural forest trees, but it was found difficult to carry out the scheme, as the Municipal Act does not vest the Commissioners with control over the property of private owners. As this Act is about to be amended, opportunity should be taken of the occasion to rectify, through the proper channel, this with other defects referred to in subsequent sections of the present Report.

5. Appended to this Report will be found a note addressed to me by Mr. Justice Cunningham, which I commend to the consideration of the Municipality. It represents the substance of numerous similar complaints which have been made to me of the state of Darjiling, and supports, in many respects, the results of my own personal observations.

6. *Houses.*—That Darjiling is very much overbuilt is only too evident, but what is surprising is that the Municipality have never, as I am informed, secured to themselves the right of veto upon new constructions undertaken without their previous approval and sanction. This power appears to be so primary a necessity in the constitution of the laws of every Municipality, that it is unaccountable that no steps have yet been taken to provide for it in Darjiling. No new building of any sort should be commenced without permission previously obtained from the Municipality, sanctioned by approval of plans submitted for their inspection, and passed by the local Health Officer. To permit structures of all sorts and kinds to be run up on every avoidable patch of ground, as is being done at Darjiling, regardless altogether of anything but the proprietor's individual convenience, is to violate one of the primary principles of urban sanitation. Not only should the most scrupulous supervision be maintained in respect to proposed buildings, but no alteration or addition of any sort to existing structures should be allowed, until they have received the approval of the Health Officer and the sanction of the Municipal Committee.

7. Another most important matter in a place like Darjiling is efficient house to house inspection. Hitherto, as far as I can ascertain, nothing of the kind appears to have existed. If among the subordinate officers of the Municipality there is a Nuisance Inspector, it is very evident that that officer does not do his duty. It is needless for me to append a statement of all the instances of negligence and immundicity, which have either come to my own personal notice, or have been indicated to me by others. An active and capable Nuisance Inspector would soon discover these, and bring offenders immediately to task; nor does there appear to be any reason why a smart subordinate should not, among a population of only 7,000 inhabitants, submit a report monthly of the condition of every house, hut, or hovel in the place. The efficient organization of an establishment for this purpose is one of the subjects to which serious and early attention should be directed.

8. *Drainage.*—The drainage has been described in former reports. Praiseworthy attention has been bestowed on the road drains generally, and on some of those in the bazar. Many of the latter, however, are very imperfect. They are frequently nothing but roughly excavated channels covered over in many places with wooden stages, so that they are hidden to view and unsuspectingly become traps for the accumulation of all sorts of refuse and filth. That they are often used as latrines and urinals by the natives, whose careless habits in this respect are well known, is certain. It is true that during the rainy season it does not much matter what happens in these drains, for the abundant flushing which they continually obtain from the prevailing heaviness of the rainfall, speedily renders them innocuous. But during dry seasons, when this flushing does not occur, they become not only a nuisance, but also a grave source of danger. What takes place then is the following: Organic refuse of various descriptions finds a resting place in the many nooks and crevices of those irregularly cut channels. There it undergoes a process of decomposition, gradually dries up, assumes a more or less pulverulent form, and is thus carefully prepared to be taken up by the first eddying air current for distribution into the surrounding atmosphere, and for inhalation by the unwary passers-by. Pathological experience shows that this is one of the most common ways in which typhoid and other infectious fevers become disseminated among a population, and it is by no means one of the least alarming aspects of this question that pathogenic agents of this description may be dormant in a dry state for months, or even years, maintaining, like vegetable seeds, latent vitality, to be called into terrible activity whenever they chance to encounter conditions favourable to their germination. It is under contemplation, I find, to take up shortly the house drainage of Wilson's bustee and the Drum Drind property, together with the drainage of the native town, for which latter work the Municipality is negociating a loan. The Maharajah of Burdwan has also been called upon to improve the drainage of his property in Black Town. Such anticipations are worthy of all support, and chiefly of that kind which is the most likely to ensure their speedy realization. In reply to the question "has any disease been noticed in connection with obstructed drainage?" your Secretary, I observe, replies in the negative. The well known case referred to in Mr. Justice Cunningham's note, and marked (1), does not bear out this reply. It is doubtful even whether this one is the only case which has occurred during the year, whose origin can be attributed to obstructed drainage.

9. *Conservancy.*—Some improvements have been effected under this head. The number of the public latrines and the mehter establishment have been increased; the floor of the municipal stables has been made pucca, and a scheme has been developed, which, it is said, will be brought into operation next year for the improvement of the conservancy, drainage, &c., &c., of the native town. This also is one of those advantages in prospective for which speedy realization must be desired by every one interested in the sanitary state of Darjiling. How urgent this desire at present is can be readily guaged by such a condition of things as rendered the vivid description contained in paragraph 10 of Mr. Justice Cunningham's note possible. There appears to be no justifiable reason why the road-sweepings should be "pitched down the hill on the side of one of the most beautiful and favourite walks in the station." It would not be a very difficult or expensive matter to construct branch roads descending to a distance of at least 150 feet below the present shoots, nor does there appear to be any satisfactory explanation why the water from the numerous streams, which now runs uselessly down both sides of the Darjiling Ridge, should not be caught by and conveyed along the inner gutter of the most convenient road to maintain a continually flushing action upon the sites of deposit, and thereby preserve the refuse in a *moist* state, since, as has been explained above, it is such matter in a *dry* state which we have most to fear.

10. *Markets and slaughter-houses.*—There is a municipal market and a municipal slaughter-house; a new butcher's shop is also in process of construction, but is not yet ready for use. The building of a new market, I am informed, has been postponed, pending decision on its position. A plan of this building should be submitted to this office for inspection. The drainage of the existing market place is by no means satisfactory, and requires careful attention. Open drains are better than the closed ones in use where rubbish accumulates without observation. The state of the slaughter-house is also by no means satisfactory. I cannot accept the statement made in the inspection note-book that the slaughter-house is a considerable way out of the station, nor can I defend the practice of throwing the offal, &c., down the khud. It should be removed daily and properly buried. The meat inspector should be directed also to inspect every article exposed for sale in the markets, and carefully to supervise the sanitary arrangements of the markets, slaughter-house, and butcher's shop. Attention to the present system of milk-supply, alluded to in paragraph 11 of Mr. Justice Cunningham's note, with a view to improvement, is also very desirable.

11. *Water-supply.*—The arrangements under this head are the same as observed at the last inspection. Suggestions were at that time made for the extension of the water-supply scheme to the Bhootia bustee, to the quarters occupied by the moochees and butchers in the bazar, and to the jail; and it was further urged that proper places should be organised for the washing of clothes and for horse troughs, for which purpose pipe water should exclusively be used. I do not observe that any action has as yet been taken on these suggestions.

12. *Disposal of the dead.*—There are no remarks to offer on this subject, except that the private burial and burning places should be registered; that the small-pox, cholera, contagious disease, and lunatic dead should be buried or cremated by the Municipality at its own cost, and that registers of the deceased should be kept at the burning and burial places.

13. *Vaccination.*—The arrangements for this purpose continue the same. I have no further remarks to offer on them.

14. *Registration.*—The subjoined statement shows the results of registration in 1882, based on the figures submitted to this office up to date, as compared with the preceding year:—

			Ratio per 1,000 of population.			
			Deaths.		Births.	
			1882.	1881.	1882.	1881.
Darjiling	town	...	19·26	17·21	10·25	5·92
Kurseong	thanna	...	5·58	10·37		
Phansedewah	"	...	5·62	8·00		
Darjiling	"	...	7·98	10·75		
Kalimpong	"	...	7·13	37·42		
	District	...	7·05	10·73		

The figures indicate that with some improvement in the urban circle there has been a marked falling off in all the rural areas, and that the results throughout are absurd, indicating very clearly that very little or no attention is bestowed on this subject. Is it too much to hope that the Municipal Commissioners, the Deputy Commissioner, and the Police, will direct more earnest and most sustained effort to the improvement of registration in the areas under their respective jurisdictions? Repeatedly as it has been already urged, the request is again submitted that, the provisions of the Compulsory Registration Act, particularly its penal clause, may be fully utilized, and that the suggestions for improving registration in other ways offered in former reports, may be more seriously considered.

Note by Mr. Justice Cunningham *on Act V of* 1876 (*B*).

"You will not, I hope, think me officious if I venture to address you as the chief sanitary official of Bengal, with regard to the sanitation and public control of Darjiling. It is a subject in which all we residents of Calcutta, whose holiday is almost necessarily taken at Darjiling, feel a deep personal interest; and as the place grows, as it obviously will, it becomes every year of more serious importance. My apology for trespassing into your domain must be that I have had some personal experience of the inconveniences to which the present state of things contributes. My family has had a very narrow escape of destruction by a cataract of mud and rocks, caused by the overflow of the drainage on the mountain side above the house which I was renting, No. 2, Aukland Terrace. Subsequently I was obliged to leave the same house at a moment's notice, owing to the fall of the revetment which had been just built to support the road above, and the house being pronounced by the Road Inspector to be unsafe. Early in the season a lady in the adjoining house to mine died from blood-poisoning, attributable, in the opinion of the three doctors who examined the case, solely to the condition of a drain which ran under one of the rooms. Danger and deaths of this sort are preventible, if proper precautions are taken; they are certain to occur if matters are allowed to go on, as it appears to me that they do at Darjiling, without adequate skill, experience, attention, and money being devoted to securing the public health, comfort, and safety, and guarding against those dangers to which the concentration of a considerable population in a limited area necessarily gives rise.

2. "I will mention several of the matters in which, I think, reform is needed; and, in doing so, I trust I may be understood as intending no criticism on, or discourtesy to, any of the local officials, high or low, as to whose performance of their duties I have not any right, and certainly no wish, to express an opinion. The points to which I refer are connected with the system and the law, not the conduct of individuals.

3. "In the first place, Darjiling is greatly overbuilt. No one can look at the place without seeing that the houses are crowded to a degree that must in the long run be prejudicial to health, and which will inevitably, if vigilant precautions are not taken. result, at no distant date, in an outbreak of disease. An Indian house, do what you will in the way of protection, must inevitably contaminate the surrounding soil. The crowds of servants, hill-men, &c., whose habits and condition do not favour general cleanliness; the drainage of stables and cow-sheds; the usual method of house conservancy; the sweepings of the cook-house—all favour the probability of a large amount of impurity, solid and liquid, gradually passing into the soil, and the subsoil becoming thoroughly and dangerously impregnated.

One main remedy for these bad consequences is an ample space around every house, on which the purifying effects of soil and air may work a natural cure. But what do we see at Darjiling? Houses crowded wherever there are sufficient square feet to allow of a house being built, utterly irrespective of the surrounding buildings and of the question whether there is room enough for purity and health. Take for instance the block of buildings just below the Secretariat, built close against a high bank, positively all jammed together, so that it is difficult to distinguish one from another. Will any sanitary authority venture to say that these houses can be really healthy? and, by way of improving matters, I observe that another house is now being squeezed into the few square feet which remained unoccupied by the pathside, the whole of which is not really sufficient for a single room of decent and healthy proportions. What, one would like to know, is the condition, as regards saturation, of this bank and of the soil on which these houses stand? What the chance of invalids who come up, enfeebled by the hot weather, of regaining health and strength in buildings thus situated? One result of this crowding is the impossibility of having the servants' latrine and the receptacle for house filth at a sufficient distance from the house to avoid the effluvium, which such places almost inevitably produce. Several of the newest and best built houses in the place are not free from objection in this respect. One of the houses of the block below the Secretariat, to which I have already referred, has been mentioned to me as objectionable from the smells which are frequently perceptible; and the same was the case in the house which I was occupying, in which from time to time a bad smell, especially in wet weather, was perceptible, for which it is difficult to assign any cause, but the general impurity of the soil. As in this last case the servants' latrine was placed on a high bank just above the house, it is easy enough to assign the cause—the subsoil filtration of impure matter.

4. "With regard to this house, moreover, another, more fatal, objection existed. It stands at the bottom of an almost perpendicular hillside. Some years ago the same thing occurred, which has now happened, a portion of the hill gave way, the then existing house was overwhelmed, and the inmates escaped for their lives from the top windows. By whose authority was another house erected on a site which was ascertained to be of so dangerous a character? What precautions the municipal authorities may now be taking I know not; or whether the nature of the ground admits of the place being rendered really safe. The revetment built after the first landslip this season, gave way during the late heavy rain, and so weakened the adjoining soil by its fall that the Road Inspector informed me that a large mass of the mountain side, immediately overhanging the house, had given way, and must sooner or later come down. In the meanwhile he considered the house to be unsafe for human habitation. What course do the municipal authorities intend to be taken about this house? Will they allow it to be offered on lease for the ensuing season, and some unwary tenant to be exposed to the dangers and inconveniences which my family has twice undergone?. If they do, they will in my opinion, and I should hope in yours, seriously misinterpret the duties of their position as custodians of the public safety.

5. "The first thing accordingly needed is that the local authorities should possess, and freely exercise, the power of refusing leave to build, or, if built, to lease houses which cannot be occupied without risk either to the inmates or the general health. No new house should be allowed to be built within a prescribed distance of another without a sufficient area of surrounding soil, and without the requisite appliances for subsoil drainage and ventilation. The owners of existing houses, in which these latter requisites are wanting, should be required to carry out the necessary alterations, subject to the approval of the sanitary authorities.

6. "Now, as the law stands, I do not see how the municipal authorities can effectually carry out any of these measures. The sections of the Act V (B) of 1876, 256-263, which refer to building, oblige any person, intending to build, to submit a plan, shewing level, width of foundation, and lowest floor, &c., to the Commissioners for their approval; but there appears to be no power to prohibit building, or refuse permission to lease in case of a dangerous house. Nor is any such power provided for in the section as to framing bye-laws. This defect in the law (if I am right in my view of it) ought surely to be remedied forthwith.

7. "In the next place, there ought to be a really effective official supervision of all houses used for hotels or lodgings. Every such house or hotel should be from time to time inspected by a really competent and trustworthy officer, and the owners should be compelled to put and keep these houses in a condition in which they may be inhabited without danger to human life.

8. "The present state of things, it is to be feared, leaves much to be desired. Hotels are built with a view not to comfort or health, but to the greatest number of inmates they can be made to accommodate; and the comfort and health of visitors is seriously jeopardized. The sin of overcrowding is everywhere at work. Last year a friend of mine, at one of the principal hotels, found an intolerable smell constantly present in his sitting room. The floor was taken up in search of a dead rat, but inspection proved that the smell arose from the space under the room being occupied partly by a meat larder and partly by a poultry shed. For weeks the unfortunate inmates had been living within a few feet of the filth that a godown full of fowls implies, and inhaling odours day and night. Irregularities such as this would be stopped by any proper system of inspection.

9. "Then, again, as to a subject which I have already mentioned, the improper proximity of servants' latrines and receptacles for filth. I know residents at one of the chief hotels, who have been obliged throughout this season to sit continually with closed windows on account of the bad smells thus occasioned. Can such a state of things be anything but hostile to health, and ought any hotel to be allowed to perpetuate it?

10. "To come to smaller matters. Could not something be done to obviate the inodorous heaps of house-sweepings, kitchen remains, and other unsavoury debris, which lie about, sometimes for days together, by the roadside, polluting the atmosphere and the soil, and to effect some better way of getting rid of kitchen refuse from houses, than draining it down in a black fœtid stream by the roadside. The open carts too, in which a tardy removal is effected, ought to be replaced by proper covered sewage-carts, and surely the primitive plan of pitching all the refuse of the house out into the public roadside might be replaced by some more decent arrangement. Covered iron receptacles ought to be insisted upon, and the contents ought to be removed early in the day. A walk through the bazar will convince any one of the inadequacy of the present arrangements and the disagreeable results to eye and nose. Every one of these heaps tends necessarily to the pollution of the atmosphere and the soil. What again must be the state of the sanitary arrangements of a place where, as you told me, the carcass of a newly-slain sheep can be exhibited by the side of the mall. Surely, too, the municipality could dispose of the street-sweepings, stable-dirt, &c., in some less objectionable manner than by pitching it down the mountain on the side of one of the most beautiful and favourite walks in the station. Would it not be possible to arrange for the removal of all objectionable matter by means of the tramway? Something, moreover, should be done to improve the condition of the nullah which runs down from the bazar, within a short distance of the hospital, and which at present seems to me well calculated to engender disease. When I examined it a month ago, its banks were strewn with filth, including, I remember, among other things, what looked like the hind leg of a bullock. The land in this part of the station has been allowed to be covered with lowest sorts of huts, built, apparently, without the least system or control. They are bad neighbours for a hospital. The general testimony of those whom I have consulted is, concurrent with my own, that Darjiling, despite all the exquisite beauties with which nature has endowed it, is full of ugly sights and offensive smells. On the whole, this part of the conservancy arrangements must be pronounced inadequate for the size, population and importance to which Darjiling has now attained, however well they may have answered when the station consisted of a few scattered houses.

11. "Another matter, which greatly requires reform, is the milk-supply. The experience of every one who takes a house here will, I am sure, bear me out in saying that, as matters now stand, this is a constant topic of worry, anxiety and expense. You must make the best bargain you can with the local cow-man, and if you have not the cows on your own premises, it is impossible to get unadulterated milk. On the other hand, very few houses, and none of those now in course of construction, have cow-houses, or space for grazing, and visitors are accordingly almost forced into drinking milk, as to the purity of which they have absolutely no guarantee, and which they need only look at to see that it has been tampered with. I was informed that the difficulty of getting milk has been aggravated by the greater distance at which now, owing to forest regulation, the cow men have to find pasturage, and that there has been a deterioration in the health of the children in consequence. However this may be, surely there ought to be some means of securing such an absolute necessity of health, safe from the risks caused by adulteration, or by the uncleanly fashion in which the cows are housed and kept. Could not the local Government be induced to sanction some arrangement by which milk should be supplied by some responsible company or institution, such, for instance, as Dr. Greenhill's farm? Or could not a company be formed for the purpose? The experiments at the model farm at Madras showed that milk-keeping, properly managed and on a large scale, might be made an extremely remunerative matter.

12. "Another requisite for health is a market, properly housed, with due provision for the inspection by competent experts of every article of food exposed for sale. *A propos* of this, you may be interested in the account in a *Times* of last month which I enclose, showing the results of the precautions taken in the meat market at Hamburgh. Such precautions no doubt excite the ridicule of the ignorant; but the remarkable decrease in the death-rate of English towns, where sanitary measures have been carried out, as shown at the recent Sanitary Congress, prove their substantial importance as regards the public health.

"If you can take any action with a view to remedying the shortcomings which I have mentioned, you will be conferring a great and lasting public benefit. At present the residents of Calcutta have the really inestimable benefit of a delightful sanitarium within a few hours' easy journey. The admirable institution about to be opened, within whose hospitable halls I found—thanks to the kindness of the authorities—a welcome refuge, will bring within the reach of every invalid the delightful possibility of that best and pleasantest of all remedies—residence in a delicious climate, cool atmosphere, refreshing breezes, and lovely scenery. But these advantages may easily be neutralized by negligence or stupidity.

14. "Darjiling ought, I maintain, to be kept not only up to a decent average of healthiness, but at a standard as high as money, care and knowledge can provide. The invalids and children who repair thither ought to have every possible chance of health and enjoyment, and a standard ought to be set to other localities of the way in which such matters ought to be conducted.

"It will, indeed, be a matter of regret if all its natural advantages are marred by our neglect of precautions, which it is so easy to take, and the efficiency of which experience has so amply attested."

Action taken on the suggestions made—

In paragraph 3.—The Commissioners believe that greater activity in administering the sanitary clauses of the municipal laws has been shown lately, and they consider that the sub-division of the town into wards, and the appointment of a paid Vice-Chairman, will still further improve matters. They have further directed the re-issue of the hand-book of conservancy sections and bye-laws to all house occupiers at the commencement of the season.

In paragraph 4.—The Commissioners have already made suggestions as to amendment of the Municipal Act necessary to protect trees.

In paragraph 7.—Provision has been made for a Nuisance Inspector for the eight months of the season, and steps taken to secure a house to house inspection to ascertain their sanitary condition.

In paragraph 10.—The Commissioners propose to ask Government to give the aid, among other things, towards the erection of a market shed. They think it probable that Government will before sanctioning this project, consult the Sanitary Commissioner in the matter. They state that most of the offal is readily taken by Bhuteas, and the rest is removed by natural scavengers.

In paragraph 11.—Some horse troughs have been already constructed. Rules against indiscriminate washing of clothes have been made, and prosecutions for breach of these rules are frequent. The question regarding the extension of the water-supply to the Bhootea busti was, among others, to be submitted to Government for consideration. As to its extension to the jail, the Commissioners have nothing to do with it, except give their sanction to the proposal, and this was given in 1881.

In paragraph 12.—They report that the only private burial-ground known has been registered; that the suggestion for the cremation or burial of persons dying in the small-pox hospital will be adopted; that the same precautions will be observed in cases of other contagious diseases, if considered necessary by the Civil Surgeon; and that it is unnecessary to adopt registration at burning and burial places.

In paragraph 14.—The Commissioners believe that the Deputy Commissioner has already drawn the attention of European residents to the law as to registration, and they intend that the police shall again receive instructions as to registration of births and deaths generally.

Baranagore.—*Inspected in November.*—The sanitary condition of this town was found to be very unsatisfactory. The drainage is most defective and appears to be daily becoming worse. The Railway embankments to the east of the Municipality are accused of not being provided with sufficient waterway to permit of efficient drainage eastward. The site at present used as a burning ghât is most objectionable. There is no place for the interment of human remains, and no arrangements appear to exist for the disposal of dead animals. No provision of any kind is made for maintaining, even moderately, wholesome sources of drinking water. There is not any conveniently situated public institution for the treatment of the indigent sick.

The suggestions were:—(1) To address the Railway authorities with the view of their adopting measures to improve the drainage eastward, such representation being supported by carefully collected data and a correct survey with levels. (2) To construct a platform of sufficient area, above the level of the highest known rise in the river, protected by retaining walls and provided with suitable screen walls to be used as a burning ghât. (3) To bury all dead animals, setting apart a piece of land for the purpose, if necessary. (4) To provide a place of interment for the Mahomedans. (5) To specially select, for drinking purposes, only tanks in convenient situations, removed from the vicinity of latrines, or other sources of contamination; to raise the borders of these tanks sufficiently high, so as to prevent drainage into them; to induce the population to take an intelligent interest in maintaining those tanks free from pollution, and to use them, and them only, for drinking purposes; and to prevent the growth of weeds, rushes and rank grass on the edges of the water, as also to remove all decomposing vegetable matter—growing aquatic plants being, however, allowed to remain, as these are beneficial. (6). To erect a conveniently situated public institution for the treatment of the indigent sick. (7) to devote an adequate share of the income of the town to its sanitary interests.

Action taken on the suggestion:—It was reputed that arrangements had been made for a detailed survey, with levels, of the town, with the view of addressing Government for a loan to carry out a drainage scheme on a comprehensive scale, a sum of Rs. 1,000 having been provided in the Budget for a map of the Municipality; that it was resolved that Rs. 3,000 be allotted for improving the burning ghât, and that a plot of land, not exceeding 10 cottahs in area, be set aside in each of the five wards of the town for the burial of dead animals; that the Vice-Chairman had been requested to select a site between Belghoria and Palparah for a Mahomedan burial-ground, to arrange, in consultation with the owners of tanks, for setting apart one tank in each ward for drinking purposes, and to communicate with the Chairman of the Calcutta Corporation with the view of erecting eight hydrants along the Grand Trunk Road in connection with the water-works; that an Inspector of Nuisances be appointed; and that two sites, of five beegahs each, be selected for depositing stable refuse and bazar-sweepings.

Mozufferpore.—*Inspected in December.*—The chief wants in this town are a good water-supply, and a proper system of drainage. The conservancy arrangements are more satisfactory than those obtaining in many other towns.

The suggestions were:—(1) To provide a good water-supply and a proper system of drainage (2) To allot a smaller portion of the income for the maintenance of roads, which have already received sufficient attention and are in good condition. (3) To reconsider the proposition to introduce the Latrine Act, which had been vetoed on what appears to be insufficient grounds (4) To check the practice of urinating in the drains. (5) To increase the strength of the conservancy establishment. (6) To establish more public latrines, particularly near the kutcheries and markets. (7) To cause the private privies to be attended to by municipal mehters. (8) To provide funds, now that the municipality has been relieved of the cost of the police, for giving effect to the proposal made in the last Inspection Report to introduce water from the Gunduck river into the tanks throughout the town. (9) To endeavour to overcome the prejudices of the people against using river water. (10) To submit to Government for sanction, through the Commissioner of the Division, the proposal to bring into operation the law rendering vaccination compulsory. (11) To rectify the sanitary defects in Poorana Bazar especially in Babbantoli. (12) To take steps at once to fully utilize the provisions of the Compulsory Registration Act, and to enforce its penal clause systematically.

Action taken on the suggestions :—Not yet reported.

F. W. A. de FABECK,
Offg. Sanitary Commissioner for Bengal.

Office of the Sany. Commr. for Bengal,
The 10th June 1883.

APPENDIX No. IX.

STATEMENTS EXHIBITING PARTICULARS REGARDING THE VACCINE OPERATIONS OF THE YEAR 1882-83 AND OTHER INFORMATION CONNECTED THEREWITH.

STATEMENT No. I—*Showing particulars of Vaccination*

Number.	Circles and Districts.	Population according to Census of 1881.	Average population per square mile.	Average number of Vaccinators employed throughout the season.	Total Number of Persons Vaccinated. Males.	Females.	Total.	Average number of persons vaccinated by each Vaccinator.	Primary Vaccination. Total. Males.	Females.	Total.	Successful. Under 1 year.	1 year and under 6.

OFFICE OF THE SANY. COMMR. FOR BENGAL,
The 15*th June* 1883.

F. W. A. DEFABECK,
Offg. Sanitary Commissioner for Bengal.

Reg. No. 410J—396—9-6-83.

MUNICIPAL DEPARTMENT.

SANITATION.

DARJEELING, THE 6TH OCTOBER 1883.

RESOLUTION.

READ—

The Report of the Sanitary Commissioner for Bengal for the year 1882, and the Vaccination Report for the year 1882-83.

Read again—

The Reports for the previous year, and the Resolution recorded upon them.

In consequence of the orders under which the Vaccination Report is incorporated with the General Report of the Sanitary Commissioner, the combined Report was not received by Government until the 18th July. As the Vaccination Report relates to the financial year, which ends on the 31st March, it is impossible to require the submission of the Sanitary Commissioner's Report on the date hitherto prescribed.

2. The temperature of the year 1882 was on the whole slightly below the average, the mean being 76°·15 against a normal mean of 76°·24. It was sensibly above the average in January, March, and December, and below it in May. The distribution of rainfall was more irregular than usual. The total fall of the year was 57·66 inches throughout the Province, against an average of 60·99 inches, the deficiency being spread over the greater part of Behar and Northern and Eastern Bengal. The rains began somewhat earlier than usual, the fall in May being 1·04 inches above the average. On the other hand July was unusually dry; and a break which occurred in the early part of October was succeeded by a heavy fall over the whole Province in the latter half of the month. In no division, however, was there any marked excess or deficiency of rain during the year as a whole.

3. The registration of vital statistics received considerable attention during the year, and the Sanitary Commissioner is of opinion that the results indicate that more than usual care has been bestowed on the subject by the magisterial and police authorities. Dr. deFabeck in particular instances the success attained in Burdwan under the energetic administration of Mr. Larminie. This officer "visited every registering circle at least twice during the year; instructed the superior police officers in the nature of the steps to be adopted for keeping the chowkidars in check, and threatened punishment for remissness. Some were severely punished. The publicity which the report of these active measures soon obtained brought about a palpable improvement, for the year's results showed an increase in the number of deaths recorded of 8,287." The Lieutenant-Governor observes that in this district the recorded death-rate is 35·42 per mille; while the birth-rate in the town of Burdwan is 27·58. If the conclusions arrived at by Mr. Bourdillon in his Report on the Census of 1881 are correct, and the true birth and death-rates of the Province are assumed to be about 34 and 31 per mille respectively, it is probable that the returns of Burdwan, a district where the well-known local fever has for years produced an abnormally large number of deaths, together with a reduced number of births, are not very far from the truth. Excellent results were also obtained in Bankoorah and Chumparun, where the Magistrates, Messrs. Anderson and Henry, devoted special attention to the accuracy and completeness of the returns. Wherever this is the case, it has been abundantly proved that a fair degree of accuracy can be secured; but a system which relies on the spasmodic and intermittent efforts of individuals can at best but look for a partial and uncertain success. It is hoped that the Union Committees to be established under the Local Self-Government scheme will, if properly supervised, provide a valuable agency for the collection of these statistics.

4. A register of mutations of births and deaths, which was devised by Mr. Carstairs, the Sub-Divisional Officer of Serampore, was given a trial during

the year, and was introduced experimentally into a number of municipalities and unions. It was not, however, found wholly successful, and its use is no longer enforced. A scheme drawn up by the Sanitary Commissioner for investing Civil Surgeons with greater powers and responsibilities for the effectual scrutiny of mortuary and birth returns was also introduced, but was found unsuitable in consequence of the serious increase of work which it threw on the ministerial establishments. Arrangements have, however, been made, in accordance with a suggestion of the Government of India, to publish in the *Calcutta Gazette* weekly returns of births and deaths in all first-class municipalities, in addition to the usual monthly mortuary statistics of districts. The Compulsory Registration Act IV (B.C.) of 1873 is now in force in 113 towns, including the Hazaribagh Municipality, into which it was introduced after the close of the year under review. Prosecutions were instituted under its provisions in the following towns only :—

Districts.	Towns.	Number prosecuted.	Number convicted.	Number acquitted.	Number struck off.	Number pending trial.	Amount of fines realised.	Birth-rate per 1,000 of population.	Death-rate per 1,000 of population.

It is impossible to believe that no breaches of the law occurred in any of the 94 towns not mentioned in the foregoing list. The Lieutenant-Governor has more than once pointed out that, where the Act has been introduced, it should not be allowed to remain a dead-letter, and he trusts that it will not again be necessary for him to draw attention to this matter. The Sanitary Commissioner should consider the advisability of requiring the submission in future of periodical returns showing the proceedings taken under the Act.

5. Births were registered in 45 towns against 46 in the previous year, registration having been discontinued in one town, Burhea in Monghyr. Excluding 1,501 still-born children, the number of births registered was 37,198 against 38,456 in 1881. The reduction amounted to 1,258, and the recorded birth-rate fell from 23·25 per 1,000 to 22·49. The excess of deaths over births as registered amounted to 11·41 per 1,000 against 11·54. The Sanitary Commissioner remarks that "in 15 towns against 12 in 1881 the birth-rates were highest." This observation is not understood. In 1881 there were 20 towns in which the recorded birth-rate exceeded 30 per mille, while in the year under review the corresponding number was only 13. These were the following, viz.—

	1882.	1881.
Jamalpore in Monghyr	43·79	43·94
Jamalpore in Mymensingh	40·64	40·76
Bhagulpore	37·87	37·73
Sitamurhi	37·22	30·53
Behar	35·75	35·96
Brahmanbariah	35·11	30·04
Gya	33·73	34·18
Monghyr	33·50	34·59
Basirhat	33·30	26·25
Kendraparah	32·55	33·06
Comillah	31·76	22·50
Bankoorah	31·47	25·49
Serampore	30·26	29·28

The greatest improvement took place in Bhagulpore, Gya, and Comillah. Only nine towns recorded births in excess of the death-rate. These were Jamalpore in Mymensingh, Brahmanbariah, Monghyr, Sitamurhi, Bettiah, Comillah, Mokameh, Chuprah, and Behar. Of the children born during the year, 20,040 were males and 17,158 females, the proportions being 116 males to 100 females against 113 in the previous year. In England the corresponding proportion is 104 males, which was approximated by only eight towns during the year under review It must, however, be remembered that in this country the average age of the husband exceeds that of the wife in a much greater degree than is the case in Europe, and that in accordance with a well established physiological law a higher proportion of male births must therefore be expected.

6. The number of deaths registered throughout the Province, the 15,076 still-born children not being counted, was 1,349,651, or at the rate of 20·41 per 1,000 of the population. The death-rate in each of the last six years was—

	Deaths	Ratio per mille
1877	1,077,601	17·96
1878	1,064,116	17 73
1879	951,881	15 85
1880	922,633	15·40
1881	1,255,478	18·99
1882	1,349,651	20 41

The ratios for 1881 and 1882 are calculated upon the population as returned at the census of 1881; while those for the previous years are calculated on that of the census of 1872. The improvement during the last two years is therefore even greater than the above figures appear to shew. The highest death-rates were recorded in Nuddea (39 37), Burdwan (35·42), Beerbhoom (34 34), Bankoora (32·21), Moorshedabad (30·80), Patna (29·28), Jessore (29 26), Backergunge (28·06), Rajshahye (27.32), and Balasore (27 27). In ten districts the recorded death-rate was below 15 per 1,000, and the figures must be regarded as worthless These were Sarun (14·85), Monghyr (14·60), Hazaribagh (14·60), Tipperah (14 16), Chumparun, where the improvements brought about by Mr. Henry only had effect in the fourth quarter (18·90), Rungpore (13·49), Furreedpore (13·15), Sonthal Pergunnahs (11·05), Mymensingh (8 94), and Darjeeling (7.01). The chief cause of the enhanced mortality of the past year, in so far as it was real and not due to improvements in registration, was the extensive and fatal prevalence of cholera. The number of deaths recorded as having occurred from this cause exceeded that of the previous year by no less than 103,172. There was, however, a considerable falling off in the recorded mortality from fever and small-pox. The urban and rural circles contributed to the reported casualties of the year in the following proportions.—

		Deaths	Ratio per mille
Urban	1882	76,601	31 05
	1881	78,848	31·96
Rural	1882	1,273,050	20 00
	1881	1,176,630	18·48

There are strong reasons for believing that the mortality in Bengal towns is little, if at all, higher than that of country tracts. In the absence therefore of evidence of any accession of disease peculiar to rural circles, it seems probable that the increased number of deaths recorded in these circles in 1882 is chiefly due to improvements in registration. The total number of male deaths was 738,090, and of female deaths 611,561. The proportion per cent. of male to female deaths was the same as in 1881, viz. 120. Only nine districts returned proportions approximating the English rate of 109 male to 100 female deaths. These were Burdwan, Beerbhoom, Bankoora, Balasore, Hooghly, Khulna,

Pooree, Cuttack, and Lohardugga. The following table shews the registered mortality according to age :—

	Ratio per 1,000 of Population.			Ratio per cent. of male to female deaths.
	Urban.	Rural.	Province.	
Under 1 year	184·45	86·31	89·94	121
1 to 5 years	39·98	21·08	21·59	109
5 to 10 years	21·27	11·89	12·14	131
10 to 15 „	16·41	11·00	11·18	137
15 to 20 „	27·49	13·86	14·17	113
20 to 30 „	22·10	15·12	15·43	110
30 to 40 „	23·68	16·70	17·01	134
40 to 50 „	26·03	21·60	21·81	145
50 to 60 „	36·52	30·72	30·98	122
Above 60 years	62·07	45·62	46·29	101

These figures illustrate the terrible mortality among infants under one year of age. The Sanitary Commissioner reports that in 26 of the urban areas, the ratios of infant deaths ranged from 200 to 515 per 1,000 of infant population. The relative mortality among the different nationalities was much the same as in former years, the death-rates per mille being for Christians 14·20, for Hindus 20·48, for Mahomedans 20·71, for Buddhists 2·88, and for other classes 16·09.

7. In Calcutta both the birth and the death-rates are below those recorded for the other Bengal towns, being 17·32 and 30·41 per mille respectively, against 22·49 and 31·05. There are no variations of importance in the death-rates from particular diseases, except in the case of fever, the death-rate from which, probably, owing to more correct diagnosis, is only 8·35 per mille in Calcutta against 15·72 in other urban circles, the death-rate from "Other causes" being proportionately swollen. The average mortality in cantonments, with a population of 56,168, was at the rate of 13·35 per 1,000. There were no deaths in Fort William. During the year the Port of Calcutta was visited by 24,128 seamen, of whom 19,764 were Europeans and 4,364 natives. The average daily population of European seamen was 1,792; the number of admissions into hospital was 2,257, and there were 100 deaths. The proportion of deaths to population was therefore 55·80 per 1,000 against 53·33 in 1881. The increase is traceable to cholera, dysentery, and enteric and malarious fevers. Among native seamen the deaths amounted to 186, or at the rate of 7·32 per 1,000, against 141, or at 5·54 per 1,000 in the previous year. This increase was entirely due to the prevalence of cholera. A native Inspector has recently been appointed to supervise the floating population of the port, who, amongst other duties, is charged to advise them where to seek for medical aid when sick, and it is hoped that by this means some improvement will be effected in their sanitary condition.

8. The most prominent feature in the sanitary history of the Province during 1882 was the remarkable prevalence and fatality of cholera. The number of recorded deaths from this disease was 182,352, or at the rate of 2·75 per 1,000 of population—a mortality which was never reached in any year of the previous decade except in 1876. Cholera was found in 27,314 villages against 15,581 in the previous year; and prevailed epidemically in 115 circles, severely in 118, and mildly in 376, being altogether absent from only 86. Urban circles contributed 11,830 deaths, and rural circles 170,522, or at the rates of 4·79 and 2·67 per 1,000 respectively. The districts in which the mortality was most severe were Balasore (6·21), Jessore (6·05), Nuddea (5·46), Purneah (4·79), Mozufferpore (4·68), Backergunge (4·50), Pooree (4·25), Cuttack (4·19), and Durbhanga (4·14). The Commissioner of the Presidency Division will be requested to invite the attention of the Commissioners of the Suburban Municipality to Dr. deFabeck's remarks regarding the condition of the Chitpore, Nawabputty, and Khalaseebagan bustees, and the bustees in Bhowanipore, Kansaripara and Bhatpara, and to submit a report on the subject. The disease was as usual most prevalent in the dry months of February, March, April, and May, and subsided rapidly on the breaking of the rains, increasing again in November and December. The general relation of cholera to rainfall appears to be the only fact in connection with this disease which is known with any degree of certainty. The Sanitary Commissioner writes :—"The reports of the year do not cast any new light upon the etiology of the disease. Polluted sources of drinking supply

are always more or less suspected, and local insanitary conditions are very generally indicated as exciting or predisposing causes; but it is also to be remarked that in several instances local incidence of the disease is often quite independent of local conditions. Climatic insalubrity, deficient rainfall, imperfect drainage, the retention of moisture and damp in the soil, errors of diet, infection, importation, &c., are all in their turn accused of favouring, if not absolutely of originating, this disease." On the whole, cholera was most prevalent in the Orissa Division, especially in Pooree Town, where the large influx of pilgrims swelled the nominal death-rate to 13·33 per 1,000. The Rajshahye and Cooch Behar Division was the least affected by the disease.

9. The recorded mortality from small-pox shows a large falling off during the past year. The number of deaths reported during each of the past four years was—

	Deaths.	Ratio per mille.
1879	22,843	·34
1880	22,953	·34
1881	24,371	·36
1882	13,651	·20

The disease prevailed with more or less severity in 33 circles against 43 in 1881, and was wholly absent in 280. The mortality was apparently high only in Chittagong and the districts of the Orissa Division, in which the recorded death-rates were 1·06, 1·02, 1·02, and ·84 per 1,000 respectively. It was also heavy in the following towns, viz. Chyebassa (12·15), Jamalpore in Monghyr (9·14), Bettiah (3·13), Balasore (2·91), and Kendrapara (2·35). The disease showed greatest activity in the hot months, from February to June, and diminished during the rains and cold weather. The following table shows the number of deaths from small-pox among children under 12 years of age:—

	Deaths.	Proportion per cent. to total mortality.	Proportion per cent. of male to female deaths.
Under 1 year	2,999	21 96	111
1 to 12 years	6,130	44·91	109
Total ...	9,129	66·87	110

The proportion of deaths among children to total deaths was 66·87, which, though still very high, is less than in the previous year, when the corresponding percentage was 72·04.

10. According to the returns, the mortality from fever amounted to 929,943 deaths, against 940,911 in the previous year. The reported death-rate per mille from this cause thus nominally fell from 14·23 to 14·06. The Sanitary Commissioner rightly observes that "this reduction is unimportant, and does not remove the belief derived from a study of the general fever history of the Province that, on the whole, fever was as prevalent and almost as fatal as it had been in the preceding year, whose records figure by far the highest rate of mortality of any year under registration." Dr. deFabeck points out, however, that the death-rate of a year which follows on another of exceptional mortality is swollen by the deaths of those whose constitutions had been undermined by the epidemic of the previous year. The following table shows the mortality from fever in each year of the last decade:—

	Deaths.	Ratio per mille.
1882	929,943	14·06
1871	169,605	2·56
1872	237,868	3·59
1873	303,645	4·59
1874	328,721	4·97
1875	368,087	5·56
1876	561,537	8·49
1877	711,036	10·75
1878	742,887	11·23
1879	622,260	9·41
1880	689,605	10·43
1881	940,911	14·23

The increase which is apparent in the record of late years is probably not so much due to greater mortality as to improvement in registration. During the year under review the virulence of the disease was limited, with few exceptions, to the Burdwan, Presidency, and Rajshahye Divisions, the districts most seriously affected being the following:—

	Ratio per mille.
Nuddea	30·18
Burdwan	28·86
Beerbhoom	27·62
Bankoora	26·40
Moorshedabad	26·01
Rajshahye	24·24
Jessore	21·61
Bogra	19·72
Hooghly	19·63
Khulna	18·65
Pubna	17·97

On the other hand the districts of Midnapore, Howrah, 24-Pergunnahs, Dinagepore, and Rungpore, and the sub-division of Serampore, enjoyed comparative immunity. In Backergunge, Gya, Maldah, and Purneah there was no abatement from the fatality of the previous year, but throughout the rest of the Province the suffering was less severe, notably so in Hazaribagh, Patna, Julpigoree, Dinagepore, Midnapore, and Rungpore.

11. In paragraph 115 of the Report, Dr. deFabeck has made some very interesting remarks regarding the theories commonly put forward to account for the incidence of fever, and he has well exposed the fallacy of the widely prevalent idea that growing vegetation is in itself noxious to human and animal life. "If we regard malaria, as experience gives us every warrant for doing, in the light of a nutritive element to plant-life, whatever little we may know of its agency in regard to the human organism, it must plainly be our constant endeavour so to regulate the balance between soil-emanation and plant-absorption, that the energy of the latter may always be equivalent to, or more potent than that of, the former. Where this equilibrium of counteraction cannot be obtained, there it will be necessary to devote careful attention and labour to efficient drainage of the soil" And again: "There is a very common, but a very ill-grounded, prejudice in India against *growing* vegetation. Low vegetation, in so far as it excludes air and prevents proper ventilation, is undoubtedly objectionable; but so far from there being any single physiological act necessary to the vitality of plant-life which can either originate or favour malarial fever, everything that is known of such action has an exactly opposite tendency." In connection with the question of drinking supply, the Sanitary Commissioner has suggested, as the result of actual observation, that water which has been exposed to a high temperature may be drunk with perfect impunity, even though containing organisms which, under ordinary circumstances, are highly inimical to health. As an instance, Dr. deFabeck mentions the case of the waste water which had been passed through the condensers of a jute-mill, and had been subjected to a temperature exceeding 212°. It was found that the coolies and other persons employed on the mill preferred this water to that of the tanks or the river, and that those who used it enjoyed demonstrably better health than those that did not. Nevertheless, on a specimen of the water being submitted for analysis by the Chemical Examiner, Dr. Warden, in ignorance of its origin, unhesitatingly condemned it as unfit for drinking purposes. These results appear to suggest that the present processes of chemical analysis, while sufficient to recognise and disclose the presence of organic virus, are not sufficiently sensitive to distinguish deprivation of its malignity. An important field is thus opened up for sanitary and hygienic research. The question is not one which can properly be discussed, at all events in its present stage, in a Government Resolution; but the Lieutenant-Governor will await with much interest the results of any further investigations which Dr. deFabeck may be able to make in this direction in communication with Dr. Warden.

12. In the Port of Calcutta fever was slightly more prevalent than in 1882. Among European sailors, the death-rate from malarious fever was 1·79 per 1,000, and from enteric fever 2·14 per 1,000. There were also 26 deaths from malarious fever among the native floating population against 33 in the year before. Dysentery and diarrhœa were very prevalent in the Port, there being 289 cases with 10 deaths, against 223 cases and 7 deaths in 1881. The fatality from these diseases was greater throughout the Province generally, the number of recorded deaths being 61,362 against 57,029. The Sanitary Commissioner is, however, of opinion that in the mofussil errors of diagnosis are more common in this class of diseases than in any other. They were most common in Patna, Serampore, Hooghly, Sarun, and the districts of the Orissa Division. Deaths from the various classes of injury, including suicide, wounds, accident, snake-bite, and wild beasts numbered 21,611 against 21,655 in the previous year, nearly one-half coming under the last-named head. Under the head of "Other diseases" there occurred 140,732 deaths, the majority of which occurred in the Orissa Division, Backergunge, Patna, and Sarun, and in the following towns—Gya, Suburbs of Calcutta, Bhagulpore, Dacca, and Burdwan.

13. Some progress was made by the Vaccination Department during the year. The operations of Government vaccinators were extended for the first time to seven thannas in the Maldah district, four thannas in Mymensingh, three thannas in Monghyr, three thannas in Bhagulpore, and five thannas in Orissa, as well as to six thannas in Patna, which had been barely touched in the previous year. The area to which protection was thus afforded for the first time amounted to 9,052 square miles of country, containing a population of 4,528,084. In addition to the above, eight thannas in Purneah and Maldah, which had been completely traversed by Government vaccinators in previous years, were placed under the licensed system of vaccination. The following table shows the number of operations performed in each vaccination circle:—

Circles.	Total number of vaccinations performed		Difference in 1882-83.	
	In 1882-83.	In 1881-82.	Increase.	Decrease.
Calcutta ...	11,373	6,955	4,418	......
Metropolitan Circles ...	344,178	314,408	29,770	......
Suburbs of Calcutta ...	15,152	13,876	1,276	......
Total of Metropolitan Circles ...	359,330	328,284	31,046	......
Darjeeling Circle ...	282,291	341,973	......	59,682
Ranchi " ...	110,893	169,333	......	58,440

Orissa " ...	43,858	40,908	2,950	......
Behar " ...	17,487	14,677	2,810	......
Total of Vaccination Circles ...	1,202,321	1,284,925	......	82,604
Municipalities and dispensaries ...	59,104	64,082	......	5,578
Grand Total ...	1,261,425	1,349,607	......	88,182

* Exclusive of the work of some of the licensed vaccinators, whose returns, 26 in number, were received by the Superintendent much after the March return had been submitted and the year's summaries closed.

There was a considerable decrease in the number of operations performed, both in the vaccination circles and in municipal areas. There was a considerable increase in the Sonthal Pergunnahs and Metropolitan Circles, and smaller ones in Calcutta, the Suburbs, Orissa, and Behar. On the other hand there was a large decrease in the Ranchi, Darjeeling, and Eastern Bengal Circles, and to a smaller extent in municipalities. The explanations offered of the decrease are, in the Ranchi Circle—(1) opposition to vaccination; (2) changes of Superintendents and consequent disorganization of the subordinate staff; (3) want of effective assistance from the civil authorities; (4) the deputation of a batch of vaccinators to Singbhoom for the suppression of small-pox which interfered with the regular progress of work in the original area; (5) the paucity of unprotected children in Singbhoom; and (6 the fact that the people of Singbhoom declined to accept vaccination at the hands of Government vaccinators, preferring to submit themselves to the licensed Brahman vaccinators. In the Eastern Bengal Circle the reasons alleged are—(1) determined opposition of the people in certain places to receive vaccination, amounting in some instances to positive violence;

(2) sparseness of the population; (3) want of subjects in areas formerly vaccinated; and (4) omission of 26 returns of operations which were not received in time for inclusion in the report. The plea of sparseness of population is not intelligible, unless it is pretended that the population has been thoroughly protected. The population has not diminished in numbers since the previous year, and there is no apparent reason why this cause, if it really exists, should have operated more powerfully in 1882-83 than in 1881-82. As a matter of fact, the Eastern Bengal Circle contains some of the most densely populated districts in the province outside Behar. The Lieutenant-Governor will await the report which is promised on the practice prevailing in this circle of promoting head vaccinators to vacancies in the post of Deputy Superintendent—a practice which Dr. deFabeck very rightly condemns In the Darjeeling Circle the reduction is said to be due to the fact that all the areas formerly available had been exhausted, and, with the exception of a part of Maldah, were made over to the licensed agency. The decrease, it should be observed, was confined to the operations of the Government vaccinators. Among municipalities the chief falling off occurred in Howrah, Rajshahye, Furreedpore, Chittagong, Moorshedabad, Midnapore, Noakholly, Chumparun, Beerbhoom, and Cuttack. On the other hand greater activity was displayed in the municipalities of the following districts, viz. Patna, Monghyr, Mymensingh, Maldah, Balasore, Pooree, Bankoora, Nuddea, Hooghly, Maunbhoom, Burdwan, Tipperah, and Shahabad.

14. The following table shows the recorded rates of success in each circle in primary and secondary operations:—

Circles.	Number of successful vaccinations				Ratio per cent. of successful cases			
	In 1882-83.		In 1881-82.		In 1882-83.		In 1881-83.	
	Primary.	Secondary.	Primary.	Secondary.	Primary.	Secondary.	Primary.	Secondary.
Calcutta ...	9,016	287	6,240	34	99·37	12·47	98·64	5·40
Metropolitan Circles ...	343,040	192	313,245	89	99·76	87·67	99·68	49·44
Suburbs of Calcutta ...	8,300	1,646	7,270	1,882	99·96	26·68	99·72	28·57
Total of Metropolitan Circles	351,340	1,838	320,515	1,971	99·76	28·77	99·68	29·13
Darjeeling Circle ...	280,425	60	338,666	8	99·78	89·55	99·08	57·14
Ranchi Circle ...	98,929	1,430	156,314	1,663	92·57	85·13	93·31	91·52
Sonthal Pergunnahs Circle ...	134,052	21	93,527	11	99·75	58·33	99·65	68·75
Eastern Bengal Circle ...	241,240	78	288,514	6	99·62	60·93	99·85	100·00
Orissa Circle ...	41,268	17	40,456	......	94·29	100·00	98·89	[illegible]
Behar Circle ...	17,159	27	14,344	2	98·65	90·00	97·79	50·00
Total of Vaccination Circles	1,173,429	3,767	1,258,576	3,695	98·87	35·45	98·66	39·91
Municipalities and dispensaries ..	50,132	1,730	57,622	1,484	92·77	69·70	92·99	54·59
Grand Total ...	1,223,561	5,497	1,316,198	5,179	98·60	45·12	98·39	43·24

A high degree of success was obtained in primary vaccinations in all the circles except Ranchi and Orissa. In secondary operations the figures returned, with the exception of those for Calcutta and the Suburbs, are still altogether unworthy of credit. This is the third year in succession in which this subject has been noticed, and the Lieutenant-Governor must now request the Sanitary Commissioner to take more effectual measures to make the returns correspond more nearly with the truth. Of the total number of persons successfully vaccinated during the year, 158,979 were under one year of age, 823,129 were between one and six years, and 241,453 were above six years. It thus appears that 79·14 per cent. of the total number of successful vaccinations were performed on children under six years of age against 73·36 per cent. in the previous year. This improvement is satisfactory. The number of infants vaccinated during the first year of life, however, is still lamentably small. If the general birth-rate throughout the Province be assumed to be 30 per mille, which is certainly below the mark, and if the infants who died are excluded, it appears that only 12·59 of the infants born during the year were vaccinated, and that the very large proportion of 80·57 per cent. remained unprotected within vaccination areas. Even this low figure, however, is a distinct improvement upon the results obtained in 1881-82, when the corresponding percentage was only 11·32. The best results were obtained in the Ranchi Circle, where the proportion of infants vaccinated rose from 17·31 to 39·37 per cent. The returns of inspection work show that creditable progress was made by the Superintendents of the Darjeeling and Metropolitan

Circles, by the Deputy Superintendents of Ranchi and the Suburbs, and by the majority of the Inspecting Vaccinators. There was, however, a conspicuous decline in the proportion of inspections made by the Superintendents of Behar, Ranchi, and Orissa, and by the Deputy Superintendents of the Sonthal Pergunnahs and Metropolitan Circles. The falling off, which is said to be due chiefly to the gradual extension of protection, and the increasing difficulty of finding subjects, appears to be in a great measure justified.

15. On the whole, it may be said that the general feeling of the people towards vaccination is becoming more favourable. Marked evidence of this is given in Burdwan, Bankoora, Hooghly, Nuddea, Rajshahye, Noakholly, Bhagulpore, Sonthal Pergunnahs, and Manbhoom. On the other hand, instances of determined opposition are not unknown, even in the most advanced towns, among particular classes. These should be rigorously dealt with under the special Act. The Inspector-General of Police will be requested to enquire into the conduct of the Sub-Inspector of Police at English Bazar in Maldah, who is said to have openly advised the people not to accept vaccination. The Commissioner of Patna will be asked to report further upon the statement that the Municipal Commissioners of Gya declined to render aid in the promotion of vaccination. The Lieutenant-Governor has learnt with pleasure that special assistance was rendered by Baboo Hem Chunder Ghose of Bagnan, Mr. Pope of Nunichi, Munshi Dilwar Ali, Baboo Rajendra Narain Mozumdar Chowdhuri of Narendahar, the Maharajahs of Hutwa and Shushung, the Rajah of Aul, and the zemindars of Bulrampore, Chowsaltipore, Madhupore and Mayna.

16. The Compulsory Vaccination Act V (B.C.) of 1880 was introduced during the year into the Municipalities of Howrah, Monghyr, Jamalpore, Gya, Serampore, and English Bazar, and into Utterparah from the 1st April 1883. It is now in force in 14 towns, and since the close of the year under review steps have been taken to introduce it into all the municipalities in the Burdwan and Presidency Divisions. The Sanitary Commissioner believes that the general extension of the Act is the only means of effectually breaking down the opposition that is still met with in many parts of the Province. It seems, however, that resistance is only offered by a few isolated classes, and is not in any way general even in the localities where it is found. The Lieutenant-Governor would prefer to deal with each case on its own merits, without having recourse to a sweeping measure for which public opinion is not yet ripe. The effect of vaccination on small-pox is illustrated by the following table :—

	Population.	Deaths reported.	Ratio per mille.
Thoroughly protected areas ...	20,223,268	579	·02
Fairly well „ „	11,785,748	1,072	·09
Unprotected areas	34,848,852	9,355	·26

And again—

	Ratio per cent. of total attacked.	Ratio per cent. of deaths to number.
Vaccinated	17·63	11·53
Inoculated	5·64	54·43
Unprotected	75·68	18·01

These figures are significant, and need no comment.

17. An important experiment was made during the year by the introduction of the system of bovine vaccination in Calcutta. Assistant Surgeon Rai Ram Sunder Ghose Bahadur was deputed to Bombay for the purpose of making himself familiar with the details of the organization adopted in that Province, and on his return early in December 1882 arrangements were immediately made for introducing the system. The first calf was vaccinated on the 23rd January 1883, and during the two months that ensued between that date and the close of the year under review a large number of vaccinations were performed. The arrangements, which are still in their infancy, are somewhat imperfect; but improvements are being effected, and it is hoped that by the close of the current year the system will have taken deep root.

18. The total cost to Government of vaccinations performed during the year was Rs. 1,16,085, of which Rs. 71,745 represents the cost of the operations performed by the Government establishment, and Rs. 44,340 that of the

establishment provided by Government for supervising the operations of the licensed vaccinators. In addition to the above, a sum of Rs. 7,997 was expended on vaccination by various municipalities in the Province. Some assistance was also given by private persons, and by Dispensary Committees, including the Maharajahs of Hutwa and Durbhunga, the zemindars of Naraya, Gopalgunge, and Bori, the proprietors of the Kurnafuli Tea Estate in Chittagong, and the Dispensary Committees of Lalgunge, Tajpore, and Burhurwa. The total expenditure of Government was less by Rs. 1,032 than that of the previous year. The cost of each successful operation performed by the Government agency was 3 annas and 3¾ pies, and that by the licensed agency 10¼ pies, aggregating 1 anna 6¾ pies for both departments.

19. The Lieutenant-Governor had occasion, in the course of the year under review, to call the attention of the Sanitary Commissioner to the comparatively small amount of *sanitary* work performed by the members of the Vaccination Department, and especially by the Superintendents of Vaccination in their capacity as *ex-officio* Deputy Sanitary Commissioners. At the instance of Government the Sanitary Commissioner drew up a set of rules for the guidance of officers of his department in the discharge of their sanitary duties. These rules were approved and promulgated too late in the year to admit of their having very much effect during the period embraced by the present report. They have, however, had the effect of causing more attention to be given to the sanitary condition of towns and villages in the interior during the camping season of 1882-83. The Lieutenant-Governor hopes that the Sanitary Commissioner will give this subject his constant attention, and he is confident that, if the diary which has been prescribed is not allowed to fall into a matter of routine, it will be productive of valuable results in the future.

20. Of the total income of the municipalities in the Province, exclusive of Calcutta, amounting to upwards of 31 lakhs, 31 per cent. was expended on sanitary works against 24 per cent. in the previous year, besides 18 per cent. on roads against 16 per cent. This satisfactory result is mainly due to the large amount of funds set free by the exemption of municipalities from police charges. The Sanitary Commissioner reports that the municipalities in the districts of Rajshahye, Mymensingh, Durbhunga, Pooree, Manbhoom, Khulna, and Patna have hitherto failed to take full advantage of the increased resources placed at their disposal. On the other hand, an exceptionally large proportion of municipal income was devoted to sanitary works in Rungpore (81·48), Dacca (47·09), Gya (41·86), Noakholly (40·61), Shahabad (39·37), Bhagulpore (38·76), Beerbhoom (37·49), Sonthal Pergunnahs (36·83), Jessore (35·60) and Howrah (35·56). Systematic drainage schemes were inaugurated and either wholly or partially completed in Midnapore, Howrah, Naihatti, the Suburbs of Calcutta, Darjeeling, and Maldah. Schemes previously commenced were continued, and in some cases completed, in Rungpore, Gya, Bhagulpore, Cuttack, Pooree, Hazaribagh, and Lalbagh. Projects were also entertained in Culna, Soori, Tumlook, Serampore, Berhampore, and Bhagulpore. Excellent work was done in Maldah, where roads were metalled, side drains cut, and jungle removed in many villages within a radius of ten miles of head-quarters, and also in the Chanchal Estate. Channels were excavated for the drainage and improvement of large tracts of country, for agricultural extension, for improving habitations, for providing water-supply, for promoting communication by boat, and for increasing the volume of water in certain channels, thereby tending to check malarious exhalations in their neighbourhood. Dr. Ghose, the Civil Surgeon of Rungpore, has given an interesting and instructive account of the valuable results obtained from the drainage operations which have been carried out in the marshes round the town of Rungpore. This scheme was begun in 1877, and year by year, as the water-logged condition of the soil has been more and more removed, and the surrounding swamps reclaimed, the death-rate of the town from fever has steadily diminished. It is now 23·64 per 1,000, where it was 34·22 in 1878.

21. In Dacca a "very commendable beginning has been made in filling up the 'gors,' the receptacles for generations of sewage, filth, and the contents of the privies, which literally line their borders." The town of Chittagong is said to have benefited much by the clearing of rank jungle in the neighbourhood,

and by closer attention to surface cleansing and general conservancy. A grant of Rs. 10,000 from General Revenues has recently been made to this municipality to enable it to carry out certain schemes of improvement, and it is hoped that much good will ensue if the money is judiciously laid out. The question of a proper supply of water for the shipping of the Chittagong Port, which is one of the great wants of the place, is receiving the attention of Government in the General Department. In the Suburbs of Calcutta and in Howrah good work has been done in reclaiming and improving bustees, and by the introduction of provisions for free perflation by means of regularly constructed lines and streets.

22. The Burdwan water-supply scheme, which was noticed last year, was commenced, and made considerable progress in the year under review. The Bhagulpore scheme is under revision, but the bulk of the necessary funds has been subscribed, and the work has now been taken in hand. Arrangements are now being made for the extension of the Calcutta water-supply to the Suburbs and also to Barrackpore, and it is expected that substantial progress will be made during the current year. The Lieutenant-Governor's attention has also been given to a proposal by which all the river-side municipalities from Howrah to Serampore should unite in a common scheme for water-supply. This proposal has not, however, yet been formulated, and is still under the consideration of the Municipal Commissioners concerned. A number of minor sanitary improvements have been effected in various districts and towns of the Province, which it is unnecessary to recapitulate at length. The thanks of the Lieutenant-Governor are due to the gentlemen, official and non-official, by whose personal exertions and liberality they have been carried out. Mr. Rivers Thompson's acknowledgments are also due to Dr. deFabeck, who held charge of the office of Sanitary Commissioner during the greater part of the year, for his very interesting report.

ORDER.—Ordered that a copy of the above Resolution be forwarded to the Sanitary Commissioner, Bengal, for information and guidance.

Ordered also that a copy of the above Resolution, and of the Report, be forwarded to the Surgeon-General, Bengal, and to all Commissioners of Divisions, for information.

Ordered also that extract paragraph 15 from the above Resolution be forwarded to the Judicial (Police) Department for information, and to the Inspector-General of Police for information and guidance.

Ordered also that a copy of the above Resolution, together with a copy of the Report, be submitted to the Government of India, in the Home Department, for information.

By order of the Lieutenant-Governor of Bengal,

COLMAN MACAULAY,

Secretary to the Government of Bengal.

No. 1379T—M.

COPY forwarded to the Sanitary Commissioner, Bengal, for information and guidance.

No. 1380T—M.

COPY, with a copy of the Report, forwarded to the Surgeon-General, Bengal, for information.

No. 1381T—M.

COPY, with a copy of the Report, forwarded to the Commissioner of the Presidency Division for information and guidance, with special reference to paragraph 8 of the Resolution, and for communication to all District Magistrates in his division.

No. 1382T—M.

COPY, with a copy of the Report, forwarded to the Commissioner of the Patna Division for information and guidance, with special reference to paragraph 15 of the Resolution, and for communication to all District Magistrates in his division.

No. 1383T—M.

EXTRACT paragraph 15 from the Resolution forwarded to the Judicial (Police) Department of this Government for information.

No. 1384T—M.

EXTRACT paragraph 15 from the above Resolution forwarded to the Inspector-General of Police for information and guidance.

No. 1385T—M.

COPY, with a copy of the Report, submitted to the Government of India, in the Home Department, for information.

Circular No. 11T—M.

COPY, with a copy of the Report, forwarded to all Commissioners of Divisions (except Presidency and Patna) for information, and for communication to all District Magistrates in their respective divisions.

By order of the Lieutenant-Governor of Bengal,

E. N. BAKER,

Offg. Under-Secretary to the Govt. of Bengal.

DARJEELING,
The 6th October 1883.

O E. G.—Reg. No. 8236C—334—18-10-83.

SIXTEENTH ANNUAL REPORT

OF THE

SANITARY COMMISSIONER FOR BENGAL,

FOR THE YEAR 1883,

INCLUDING THE ANNUAL REPORT ON VACCINATION IN BENGAL,
FOR THE YEAR 1883-84.

BY

DEPUTY SURGEON-GENERAL R. LIDDERDALE, M.D.,

Sanitary Commissioner for Bengal.

Calcutta:

PRINTED AT THE BENGAL SECRETARIAT PRESS.

1884.

APPENDICES.

SIXTEENTH ANNUAL REPORT

OF THE

SANITARY COMMISSIONER FOR BENGAL.

YEAR 1883.

SECTIONS I, II, III, & IV.

The above sections refer to matters which are not under the supervision of the Sanitary Commissioner for Bengal, but are dealt with in the Imperial Sanitary Commissioner's Reports. They are, consequently, omitted from this Report.

SECTION V.

VITAL STATISTICS.

Statistics dealt with in this Report.

2. In this Section are considered the birth statistics of 46 principal Municipal towns and the death statistics of the Province for the year 1883.

REGISTRATION.
Value of—in 1883.

3. The following tables disclose the general results of Birth and Death registration during the year under review:—

BIRTHS.						DEATHS.				
DISTRICTS.	Number of towns in each district in which Births were registered.	Number of Births registered in 1883.	Ratio of Births per 1,000 of Population in 1883.	Increase or decrease as compared with 1882.	Ratio of male Births to every 100 female Births.	DISTRICTS.	Number of Deaths registered in 1883.	Ratio of Deaths per 1,000 of Population in 1883.	Increase or decrease as compared with 1882.	Ratio of male Deaths to every 100 female Deaths.

* This apparent incongruity (increase in the number, with a decrease in the ratio of births to population) has been caused by the inclusion in 1883 of the population and births of the Cuttack town, which had no place in the statistics of 1882.

Rates per 1,000 of Population at which Deaths from All Causes were registered.		50 and above.	40 to 50.	30 to 40.	20 to 30.	15 to 20.	10 to 15.	Under 10.

Results of Birth registration.

4. The results of Birth registration attained during the year under review, as presented in the first of the above tables, are closely similar to those of the preceding year, and equally defective. The towns in which the largest number of births were omitted from the reckoning are the 18 in the districts numbered 18 to 30 in the above list.

Results of Death registration.

5. The figures representing the Death statistics indicate a retrogression in the registration of deaths to the extent of 103,975, or at 1·59 per 1,000 of the population of the Province. To this large reduction 30 of the 45 districts contributed. Similarly, a larger number of the registering circles failed to record deaths at the higher rates of 20 to 50 and above per 1,000 of population. In 1882, 354 of the 644 registering circles in the Province contributed to these rates: this year 307 of the 648 circles furnished them. Large omissions in registration are traceable to more than half the districts, viz. to those numbered 19 to 45 in the foregoing list; and of this number, those in which the least attention to the subject appears to have been paid are the following, in the order named:—

Monghyr.	Faridpore.	Singbhum.
Darjiling.	Manbhum.	Tipperah.
Mymensing.	Mozufferpore.	Chittagong.
Sonthal Pergunnahs.	Durbhanga.	Chumparun.

	14,144

The deaths recorded under each head of disease in 1883 exhibit, as compared with the figures of the preceding year, the differences marginally noted. Nearly all the local reports indicate that, independently of statistical data, cholera, small-pox and fever—notably the first-named disease—prevailed with diminished virulence and fatality as compared with 1882. The reduction in the number of deaths under these three heads, it will be seen, exceeds the net decrement in the registration of deaths; but I do not mean that it should be understood that the declension in registration has been solely caused by the less fatal prevalence of disease. I allude to the fact as merely an event of the year, which might have to some extent influenced the death record. That registration is still lamentably defective is beyond question. It has improved so far only as to yield a return which bears a somewhat closer approximation to the true death-rate* than the outcome of some former years, and to afford indications of the health condition of the people. But the progress of improvement is slow, and considering that in 15 years we have succeeded in securing a record showing only about two-thirds of the actual mortality, it appears to be time that the present machinery and organization by which the statistics are collected, recorded and supervised should give place to some other scheme which will secure for registration an intelligent and reliable agency, and systematic, continuous and sustained supervision. Under the new system of Local Self-Government it is to be hoped that better results will be obtained.

* 31 per 1,000 of population, according to the conclusions arrived at in the Census Report of 1881, page 65.

Measures adopted locally for improving Registration.

6. The usual attention was bestowed on the subject by most of the magisterial and police authorities in the way of inspecting the registers, testing the chowkidars' reports, and warning or punishing, legally or departmentally, the reporters or recorders for remissness or neglect. But, with very few exceptions, their efforts to improve registration were at best partial or desultory, not having the least pretentions to system, persistency, or permanence. Dr. Macrae, the Civil

Surgeon of *Julpaiguri* reports, and the Deputy Commissioner endorses his remarks, that a large portion of the district to the north and east of the Teesta, where there is a large and growing population of tea-garden coolies, &c., remains, so far as is known, practically unregistered, and that the very small number of thanas and outposts in this large district with a scattered population, is manifestly inadequate for securing anything like complete registration. The District Superintendent of Police of *Gya* is under the impression that, probably, only half the actual number of deaths is reported. He is endeavouring to ascertain to whom this neglect is referable.

A brief account is subjoined of a few well-meant measures adopted by some of the local officers to promote registration.

Burdwan.—In the Burdwan town a person has been specially engaged to check the registration of births and deaths. It is stated that the police now understand well that registration is an important part of their duty and that this fact may lead to the attainment of improved results.

Bankura.—The organization of the rural police and the plan of the chowkidars keeping up note-books of the events, referred to in the Report of the last year, is stated to have worked satisfactorily and improved registration, except in the backward tracts of Raipore and Khatra. This statement is, however, not supported by the records, as there was a falling off in the registration of deaths to the extent of 11·94 per 1,000 of population.

Birbhum.—Mr. Fiddian, the Magistrate, and the District Superintendent of Police visited each registering circle, and examined and checked the registers. The former officer believes that the work of registration is done fairly well in this district.

Midnapore.—In the town of Midnapore the head clerk of the municipal office was made Registrar of Births and Deaths; the municipal office was appointed as the registering circle; sections VII and VIII of Act IV (B.C.) of 1873 were translated, and printed copies thereof posted up in conspicuous parts of the town; the midwives were required to report all births at which they attend; the tax collectors and conservancy peons and jemadars were directed to bring to notice all unreported births and deaths, and the Municipal Overseer and Assistant Overseer to supervise their proceedings; cheque books were furnished to the Registrar with instructions to give to the reporters of the events their counterfoils, with the view that the reporters may be in a position, when called upon to do so, to produce them as evidence that the occurrences had been registered; the municipal wood contractor at the two burning ghats was required to furnish the municipal office with a daily list of the deceased brought to be cremated; the Mahomedan headmen of the four mohullahs, where there are burial grounds, were instructed to keep the municipality informed of all unreported interments; and the police were directed to detect and report all unreported cases of births and deaths. It was made known that half of the fines realized through prosecutions under the Compulsory Registration Act would be paid to those who brought to notice evasions of the requirements of the law. These measures improved registration in this town, as deaths were recorded at the rates of 27·56 per 1,000 of population, as opposed to 26·72 per 1,000 in 1882. It is proposed to extend the scheme to the other municipalities. In the *rural* circles the chowkidars were supplied with hath-chitties (hand-books), in which they were directed to have every death, with the necessary particulars relating to it, entered by any of the available matbars, or pathsala or school teachers, in the village, and the police were directed to test by local enquiry, while on circuit duty, the correctness of the chowkidars' reports. These efforts did not result in improvement of registration, but there was no retrogression, deaths having been recorded at 20·59 per 1,000 of population, against 20·66 in the preceding year.

Rajshahye.—The hath-chitti system, above referred to, was also introduced into this district, with the result that the record of deaths rose from 27·32 casualties per 1,000 to 32·86 per 1,000.

Hughli.—In the municipalities of Hughli, Serampore and Boidyabatti mohurirs were appointed at the burning ghats to ensure complete registration.

24-Pergunnahs.—In the Suburbs of Calcutta, the police reports were tested by the registers kept in all the burning ghats and important burial grounds.

Nuddea.—In the Ranaghat town the provisions of the Compulsory Registration Act were more fully utilized, and the members of the Ward Committees constituted themselves Registrars, and, with the assistance of the tax darogah and other municipal servants, collected the statistics and checked, as far as possible, the returns. In the district each chowkidar was supplied with a book in which the punchayets were required to note down the number of deaths which occurred during the week, and enquiries were occasionally made in the villages to test the correctness of the entries. In some instances chowkidars were fined, and even prosecuted for neglect, but on the whole they performed their duties well, and were most regular in attendance at the thanas. The systematic manner in which the work was done has, it is stated, resulted in marked improvement in registration. The returns, however, show the registration of 36 deaths per 1,000, as opposed to 40 in 1882. A record of 36 deaths per 1,000 may, however, be accepted as approximately correct, and it should be remembered that the fever mortality was severer in this district in 1882. All this is due to the energy and careful supervision of Major Ramsay, who has always, wherever he has been, taken very commendable interest in the subject, and who, with his assistants and inspectors, frequently visited the registering circles in Nuddea.

Jessore.—The Magistrate, Mr. Barton, says that he personally looked into registration at every thana, and that he found that it was generally done very fairly. Deaths were registered at 27 per 1,000 in this district, against 30 per 1,000 in 1882.

Rungpore.—Special attention was given to registration in this district by the Magistrate, District Superintendent of Police, and his subordinates, as is evidenced by the large number of visits paid by them to the villages and thanas for the purpose of testing it, resulting in the detection of many unreported deaths, and in the chowkidars being more alert in the matter. The result was a progress in registration, the record of deaths having advanced from 13 to 18 per 1,000. There is, however, great room for further improvement.

Bogra.—The Magistrate, District Superintendent, and Inspectors of Police visited all the registering circles during the year—the Magistrate at least once, and the other officers one to three times—and the chowkidars were more punctual than before in reporting deaths at the thanas. It is believed that this procedure has tended to render the statistics more trustworthy and correct than before, but deaths were recorded at 21·6 only, against 24 per 1,000.

Monghyr.—The Magistrate, Mr. Kean, has arranged with the District Superintendent of Police that the Sub-Inspectors of Police shall submit a monthly return showing the number of visits paid by them to the villages, the number of deaths ascertained, and the result as compared with the thâna registers. The registration in this district is radically defective. In fact, it returned the lowest result this year, viz. 9·93 deaths per 1,000 of population. Some systematic plan of supervision over the collecting agency, such as the above, is therefore sadly needed.

Measures adopted by this Office to improve Registration.

7. In addition to the ordinary action adopted by this office to improve registration, such as pressing the subject during tours of inspection, pointing out to each Magistrate in which circles in his district errors of registration exist, and urging him to endeavour to rectify them, &c., the weekly birth and death statistics of the principal municipal towns, and the monthly mortuary statistics of the districts are published in the *Calcutta Gazette*, and printed copies of these returns are circulated to the Civil Surgeons, with the view of securing greater attention to registration and early scrutiny of the returns for rectification of defects. The necessity of making enquiries into death statistics was also repeatedly urged on the notice of the officers of the Vaccination Department when on tour in villages. Very little attention was, however, given to the requests, and the duty seems practically to be evaded in most instances. The most noticeable delinquents are the Deputy Superintendents in the Metropolitan Circles.

8. This law was extended during the year only to the Hazaribagh Municipality, and from the 1st of May of the current year to that part of the Darjiling district which lies to the west of the Teesta river, so far as it relates to the registration of *deaths* only The enforcement of this enactment in Darjiling is highly desirable, if only to check the carelessness or recusancy of the tea-planters in the matter of registration. The subjoined statement shows the towns in which prosecutions for breaches of its provisions were instituted.

Extension of the Compulsory Registration Act, IV (B.C.) of 1873.

Although the above is a better list than that presented in the Report for 1882, it will be seen that in only 25 out of the 114 towns in which the law is now in force its provisions were utilized. This is very unsatisfactory. The views of Government on the subject, contained in paragraph 4 of the Resolution on the Annual Report for 1882, were conveyed to the Magistrates for communication to the municipalities in their districts, and quarterly statements of prosecutions instituted were called for, and are being submitted. The question has also been pressed upon the attention of the Municipal Commissioners during tours of inspection. It appears that generally no person is appointed to detect and report evasions of the law, and that it is overlooked that the chowkidar is bound under penalty, by section 6 of the Act, to report every birth or death occurring in his beat to the Registrar. I find that only in the town of Durbhanga some constables were departmentally punished for not reporting deaths. I shall take every opportunity of arousing the attention of the Municipal Commissioners to these points.

Changes affecting Circles of Registration.

9. The following alterations were made during the year under this head :—

(1) The Bongong sub-division, in Nuddea, consisting of thanas Bongong, Mohespore, Gariapotha, Sarsha and Gaighatta, was transferred to Jessore.

(2) A revision of thana and town boundaries in Nuddea resulted in an increase of population in the Santipore town and the Ranaghat rural circle, and a decrease in the towns of Ranaghat and Kishnaghur and in the rural circle of Santipore, and in the creation of a new town, viz. that of Noboddip, with a population of 14,105. On the whole, however, the population of the district was not affected by these changes.

(3) Births were registered in the Cuttack town. In fact, the arrangement came into force from April 1882, but owing to incompleteness the results could not be published in the Report of that year.

(4) Registration of deaths was commenced, for the first time, in the Banki rural circle, in Cuttack, containing a population of 56,900.

(5) For reasons already submitted to Government, a census of the European population in the Darjiling town was again taken. At this re-enumeration it was ascertained that, instead of 160, the population furnished by the census of 1881, the town really contained 1,118 Europeans. It is to be regretted, however, that this census exhibits the Europeans in two* groups only, with reference to age, instead of in the ten† groups adopted at the census of 1881. The revised figures cannot, therefore, be employed in calculating the death-rates according to age in the Darjiling town, and they also affect, similarly, the same calculations for the Province. The Government has, however, decided that in calculating the death-rates of the Darjiling Municipality, the Europeans should be omitted altogether.

* Not exceeding 12 years.
12 years and upwards.

† Under 1 year.
1 and under 5 years
5 " 10 "
10 " 15 "
15 " 20 "
20 " 30 "
30 " 40 "
40 " 50 "
50 " 60 "
60 years and upwards.

The two last changes have increased the total population under registration in the Province by 57,858, and the area in square miles by 116.

BIRTH STATISTICS.

Number born and general results on population.

10. Eliminating the still-born, numbering 1,437, the information under this head stands as follows :—

	1883.	1882.‡
Population	1,685,159	1,641,920
Number born	37,215	37,198
Birth-rate per 1,000 of population	22·08	22·65
Deaths	50,487	56,061
Death-rate per 1,000 of population	29·95	34·14
Excess of deaths over births	7·87	11·49

The number of births and the birth-rate of the year under review do not differ much from the similar information of the preceding year, but the record is, on the whole, very defective.

11. *Towns which returned the largest proportions of Births.*

	1883.	1882.		1883.	1882.
*Jamalpore in Monghyr ...	49·17	43·79	Bhagulpore	33·64	37·87
*Revilgunge	37·30	29·93	*Brahmanberiah ...	33·46	35·11
Bankura	34·93	31 47	*Sitamurhi	31·34	37·22
*Behar	34·42	32·75	Bettiah	30·47	29·11
*Jamalpore in Mymensing	34·24	40 64	Gya	29·38	33·78
Mokamah	33 88	23 75			

The towns distinguished by asterisks returned similar fair results for now three years; the others, excepting Mokamah, for two years.

12. *Towns which recorded Births in excess of Deaths.*

		Rate of excess per 1,000 of population.			Rate of excess per 1,000 of population.
1.	Jamalpore in Monghyr ...	17·03	9.	Bankura	7·57
2.	Bettiah	12·56	10.	Mokamah	4·15
3.	Revilgunge	12·33	11.	Chupra	3·01
4.	Behar	9·84	12.	Kendrapara	2·42
5.	Comillah	8·81	13.	Futwa	1·94
6.	Brahmanberiah	8·55	14.	Barrh	1·65
7.	Arrah	8 38	15.	Chittagong	1·40
8.	Jamalpore in Mymensing ...	7·89	16.	Sitamurhi	1·14

In 1882 only nine towns recorded births in excess of deaths. It is noticeable that all the towns, excepting Bhagulpore and Gya, which appear on the list in paragraph 11, appear also on this.

13. *Births according to Sex.*

	In 1883.			In 1882.		
	Number of births.	Ratio per 1,000 of population.	Proportion per cent. of male to female births.	Number of births.	Ratio per 1,000 of population.	Proportion per cent. of male to female births.
Males	19,872	11·79	114	20,040	12·20	117
Females	17,343	10·29		17,158	10·44	

‡ The populations of the towns of Kishnaghur, Santipore and Ranaghat having been altered, (*vide* paragraph 9 of this Report,) the figures in this column have been recast for comparison with the figures of the year under review. Hence they do not correspond with the figures submitted in the Report for 1882

Numerically, the results do not vary much, and the records of both years exhibit a preponderance of male births. Individually considered, all the towns, except five, also show this preponderance, the proportions ranging from 101 to 168. This is the only salient point in the record of birth registration, as the researches of medical men in Europe have placed beyond doubt the fact that the proportion of male to female births is influenced by the relative ages of husband and wife, the male births increasing as the age of the husband preponderates over that of the wife, as is notably the case in India.

14. *Births according to Class or Nationality.*

	In 1883.		In 1882.	
	Number of births.	Ratio per mille.	Number of births.	Ratio per mille.
Christians	376	21·31	371	23·49
Hindus	25,818	21·75	25,922	22·48
Mahomedans	10,970	23·10	10,852	23·22
Buddhists	2	·94	9	4·25
Other races	49	12·27	44	11·14

Eliminating the other nationalities, the Mahomedans and Hindus presented larger proportions of births than the Christians, who generally register this event more completely.

Births among Non-Asiatics and Mixed Races.

15. Under this head 660 were recorded, distributed into 329 males and 331 females.

DEATH STATISTICS.

16. *Population and Area under Registration.*

	Urban.	Rural.	Province.
Class of Circles.			
Number of main circles ...	96	552	648
Population according to Sex.			
Males ...	1,282,930	31,549,286	32,832,216
Females ...	1,186,233	32,145,435	33,331,668
Total ...	2,469,163	63,694,721	66,163,884
Population according to Class.			
Christians ...	22,222	79,662	101,884
Hindus ...	1,749,733	41,208,296	42,958,029
Mahomedans ...	689,752	20,672,205	21,361,957
Buddhists ...	2,178	77,543	79,721
Other classes ...	5,278	1,662,015	1,667,293
Extent of area of Circles.			
Number of square miles ...		144,863	
Population per square mile ...		456·73	
Deaths per square mile ...		8·59	

The increase in the population and area under registration, as compared with the figures of the preceding year, disclosed by the above table, has been accounted for in paragraph 9 of the Report.

17. *Number and Proportion of Deaths.*

	In 1883.		In 1882.	
	Deaths.	Ratio per mille.	Deaths.	Ratio per mille.
Urban	67,383	27·28	76,601	31·05
Rural	1,178,293	18·49	1,273,050	20·00
Province	1,245,676	18·82	1,349,651	20·41

The still-born children numbered 18,225, a larger figure than that of the preceding year. They are not included in the above table. The results of the year exhibit a decrease of 103,975 deaths, or at 1·59 per 1,000 of the population under registration. Both the urban and rural circles shared the diminution, the former to the extent of 9,218 deaths, or at 3·77 per 1,000 of population; the latter to the extent of 94,757 deaths, or at 1·51 per 1,000. The reduction is referable to the lesser fatality with which cholera, small-pox, fever and bowel-complaints prevailed during the year, particularly the first-named disease.

18 *Mortality from Specific Death Causes.*

	Proportion of Deaths per 1,000 of Population.								
	In 1883.			In 1882.			In 1878-82.		
	Urban.	Rural.	Province.	Urban.	Rural.	Province.	Urban.	Rural.	Province.
Cholera	3·64	1·27	1·36	4·79	2·67	2·75	3·43	1·53	1·61
Small-pox	·27	·14	·14	·34	·20	·20	·80	·27	·29
Fevers	13·77	13·81	13 81	15·72	14·00	14·06	16·14	11·70	11·87
Bowel-complaints	3·54	·73	·83	3·93	·81	·92	4·19	·71	·85
Injury	·40	·35	·35	·38	·32	·32	·43	·32	·33
Other causes	5·64	2·18	2·30	5·86	1·98	2·12	5·87	1·64	1·80
All Causes	27·28	18·49	18·82	31·05	20·00	20·41	30·88	16·20	16·75

The extent to which the above-named diseases proved more or less fatal in the Province during the year under review, in comparison with the mortality in 1882 and in the lustrum 1878-82, is indicated in the margin. Thus it will be seen that cholera, small-pox, and bowel-complaints proved less fatal than during the entire period, 1878 to 1882, with which comparison is instituted; that fever was less severe than in 1882, but considerably more so than in the quinquennium 1878-82; and that the casualties from injury and other causes were slightly higher than in 1882 and the lustrum 1878-82.

Increase or Decrease in 1883 as compared with 1882 and the quinquennium 1878-82.

	With 1882.		With 1878-82.	
	Increase per mille.	Decrease per mille.	Increase per mille.	Decrease per mille.
Cholera	...	1·39	...	·25
Small-pox	...	·06	...	·15
Fever	...	·25	1·94	..
Bowel-complaints	...	·09	...	·02
Injury	·03	...	·02	...
Other causes	·18	...	·50	...
All Causes	...	1·59	2·07	...

19. *Mortality in Bengal, Behar, Orissa and Chota Nagpore.*

	In 1883.					In 1878-82.				
	Cholera.	Small-pox.	Fever.	Bowel complaints.	All Causes.	Cholera.	Small-pox.	Fever.	Bowel complaints.	All Causes.
Bengal	1·55	·08	16·43	·63	21·11	1·49	·10	1[illegible]·70	·63	18·02
Behar	1·19	·13	11·29	·76	15·98	1·65	·25	10 03	·81	14 62
Orissa	1 82	·82	6·79	1·10	18 86	3·26	1·53	7·55	2·75	20·75
Chota Nagpore...	·37	·10	11·83	·83	15·49	·82	·26	10·44	1·23	14·46

This table indicates that, relatively, cholera, small-pox and bowel-complaints prevailed with the greatest severity in Orissa, and fever in Bengal, and that in casualties from all causes Bengal took precedence. In comparison with the mortality during the quinquennium 1878-82, cholera was more fatal in Bengal, but less so in Behar, Orissa and Chota Nagpore; small-pox exhibited less activity in all the four divisions; fever proved more severe in Bengal, Behar and Chota Nagpore, but prevailed with scarcely any abnormal degree of fatality in Orissa; and bowel complaints caused less loss to life in Behar, Orissa and Chota Nagpore, but maintained an equal death-rate in Bengal: the culminating result being that, Bengal, Behar and Chota Nagpore exhibited higher and Orissa lower mortality from all the death-causes combined.

20. *Seasonal incidence of the Diseases.*

Months.	Deaths in 1883.	Months.	Deaths in 1878-82.
December	146,722	December	122,660
November	134,038	November	115,713
January	114,446	October	96,174
October	108,138	January	95,805
September	101,659	April	93,651
August	100,169	August	87,172
April	98,218	May	86,627
July	91,173	March	86,241
May	90,491	September	83,598
March	89,628	July	83,183
February	87,634	June	81,032
June	83,360	February	76,695

The figures again indicate that the cold or drying season is the unhealthiest in the Province, as it is during this period that cholera, fever and bowel-complaints cause the greatest loss to life.

21. *Mortality according to Sex.*

	In 1883.			In 1882.			In 1878-82.		
	Deaths.	Ratio per mille.	Proportion per cent. of male to female deaths.	Deaths.	Ratio per mille.	Proportion per cent. of male to female deaths.	Deaths.	Ratio per mille.	Proportion per cent. of male to female deaths.
Males	676,175	20·59	118	738,000	22·50	120	615,472	18 74	124
Females	569,501	17·08		611,561	18·37		493,079	14·79	

Mr. Bourdillon has shown conclusively in his Census Report of 1881, page 65, that in Bengal the death-rate of the two sexes, with a nearly equal population (99 males to every 100 females), should bear a close approximation to each other. The figures in the above table indicate an improvement in this respect during the year under review in comparison with the proportion of male to female deaths in the lustrum 1878-82.

22. *Mortality according to Age.*

	In 1883.				In 1882.			
	Ratio per mille.			Proportion per cent. of male to female deaths.	Ratio per mille.			Proportion per cent. of male to female deaths.

60 years and upwards ...	55 85	43·20	43·72	97	62·07	45·62	46·29	101

The returns of the deaths of adults cannot be relied on, as the lower orders of natives generally are ignorant of their own ages. It is notorious that infants perish in considerable numbers in Bengal, and there is some approach to this truth in the record of infantile mortality revealed by the above table, for we find that the casualties among infants was noticeably high; but the urban ratio is still below that of England—182·6 per 1,000 of population of that age—and the rural ratio very much in defect. The next highest death-rate was furnished by the aged. The mortality among infants, children and the aged was represented at its maximum in the *urban* areas, for the death-rates among infants ranged from 200 to 781 per 1,000 of population in 23 towns, those among children from 40 to 102 per 1,000 in 20 towns, and those among old men from 40 to 268 per 1,000 in 45 towns. Referring to the districts, the highest proportions of death at these ages were recorded in those named below:—

Under 1 year.		1 to 5 years.		50 to 60 years.		60 years and upwards.	
Poori ...	329	Rajshahye ...	42	Nuddea ...	45	Nuddea	80
Balasore ...	235			Julpaiguri ...	41	Burdwan	71
Patna ...	211			Burdwan ...	40	Backergunge ...	69
Backergunge ...	202			Rajshahye ...	40	Jessore	62
						Birbhum	59
						Pubna ...	59
						Midnapore ...	59
						Dacca	59
						Balasore	57
						Poori	56
						Noakhalli	54
						Bankura	53
						Howrah	52
						Hughli	52
						Rajshahye... ...	51

23. *Mortality according to Class or Nationality.*

	Ratio per 1,000 of Population.								
	In 1883.			In 1882.			In 1878-82.		
	Urban.	Rural.	Province.	Urban.	Rural.	Province.	Urban.	Rural.	Province.
Christians	22·68	9·70	12·52	22·47	12·00	14·20	22·77	9·61	12·48
Hindus	27·76	18·05	18·45	31·86	20·00	20·48	31·24	16·28	16·89
Mahomedans	26·39	19·70	19·91	29·92	20·40	20·71	30·13	15·95	16·40
Buddhists	16·06	11·72	11·84	15·61	2·52	2·88	20·24	2·70	3·18
Other races	11·74	15·22	15·21	17·02	16·08	16·00	28·60	17·04	17·67

Of the three principal nationalities, the Christians furnished the lowest and the Hindus and Mahomedans nearly equal death-rates throughout from 1877 to 1883, except that during the year under review the Mahomedans suffered somewhat more severely than the Hindus.

Deaths among Non-Asiatics and Mixed Races.

24. The recorded deaths among these classes amounted to 711 (462 males and 249 females), and of this number 86 died from cholera, 1 from small-pox, 124 from fever, 83 from bowel-complaints, 28 from injury and 389 from other causes.

25. *Births and Deaths in Calcutta in 1883 compared with the same events in the Bengal towns.*

	Births.		Deaths.							
			Ratio per 1,000 of population.							
	Ratio per 1,000 of population.	Proportion per cent. of male to female births.	All Causes.	Cholera.	Small-pox.	Fever.	Bowel-complaints.	Injury.	Other causes.	Proportion per cent. of male to female deaths.
Calcutta	17·15	103	28·14	4·70	·16	7·94	3·01	·49	12·13	145
Bengal towns	22·08	114	27 28	3·64	·27	13·77	3·54	·40	5·64	123

The comparison does not reflect disadvantageously on registration in the Bengal towns, for the births appear to have been better recorded, and the death returns exhibit under all heads more or nearly equal results, excepting those of cholera and "other causes." The deaths from the former are subject to fluctuations; but those from the latter are undoubtedly under-registered to a great extent.

26. *Mortality of Natives in the 11* Cantonments in Bengal.*

		1883.	1882.
Population		33,091	56,168

	Deaths in 1883.	Ratio per mille. In 1883.	Ratio per mille. In 1882.
All Causes	731	21·50	13·36
Cholera	63	1·85	·96
Small-pox	5	·14	·03
Fever	387	11·38	7·5[illegible]
Bowel-complaints	57	1·67	1·33
Injury	16	·47	·12
Other causes	203	5·97	3·38

Compared with 1882, the gross mortality, as well as the casualties from each specific cause, were considerably greater in the year under review. The highest death-rate (61·16 per 1,000 of population) again occurred in the Hazaribagh Cantonment, and the lowest (·61 per 1,000) in Fort William, in which only one death from "other causes" took place. In the rest of the cantonments the casualty-rates ranged from 10·61 to 34·88 per 1,000.

* No returns were received from Berhampore, Julpaiguri, Dacca and Bhagulpore, as troops were not located in these Cantonments during the year.

27. Port of Calcutta—*Sickness and Mortality among European Seamen.*

1	2	3	4	5						6

The figures in the above table show that of 21,005 European seamen who entered the Port, 1,948 were admitted into hospital and 81 died, excluding 10 casualties, which occurred out of hospital, the death-rate being represented by 29·02 per 1,000 calculated on the census population, or 43·54 per 1,000 calculated on the Health Officer's estimated population for this year. Contrasting these figures with the results of the preceding year, both sickness and mortality appear to have diminished, viz. to the extent of 309 in the number of admissions into hospital, of 13 in the number of casualties, and of 4·65 per 1,000 in the death-rate in relation to the census population, or of 8·91 per 1,000 in relation to the Health Officer's estimated population. Considering the causes of the sickness and mortality, although there was an increase in the number of admissions into hospital of 72 from malarial fever, 21 from diarrhœa, 5 from small-pox, and 1 from cholera, every death cause, except "other diseases," contributed towards the reduction in mortality. Carrying the examination further, it is seen that, judged by the proportion of admissions into hospital of the average strength in the Port, the suffering among the European seamen was less during the year under review than during any of the four preceding years, as indicated by the table submitted in the margin; and that, with regard to the mortality, eliminating cholera, which was a disturbing element, for, although less fatal in 1881 and 1882, it was doubly severe in comparison with its incidence in 1880, the death-rate from the rest of the diseases was lower than in any year of the above quoted period—*vide* the marginally noted figures. On the whole, therefore, the year under review must be pronounced to have been a healthy one, which is a matter for congratulation, and indicative of the care and attention bestowed by the Health Officer on the sanitation of the Port. It is, however, painful to find that the sailor furnishes a considerably higher death-rate than the soldier. The latter, living under the same conditions as the former with regard to climate and drinking water, but subject to superior discipline and supervision, presents a cholera mortality of 2 per 1,000 of strength, and a general death-rate of 10 to 8 per 1,000; while the sailor dies at the rate

Years.	Average strength.	Ratio per 1,000 of admissions into hospital to average strength.

Total ...			178	7·00	212	57	26·88	186	7·32	212	46	21·69

The above table discloses that the sickness and mortality among the native floating population during the year 1883 did not vary much from those which obtained in the preceding year, the deaths numbering 178 against 186, and the casualty rate amounting to 7 per 1,000 of population as opposed to 7·32 per 1,000. Cholera was again the chief cause of death, and carried off an equal proportion of the population as in 1882. The mortality from the rest of the diseases, was inconsiderable. The native Inspector went about tracing cases of sickness, and endeavoured his best to get them removed to hospital. The large number of deaths out of hospital from cholera (82 out of 116) is accounted for by the fact that in many cases the short duration of the disease before terminating fatally did not permit of the attention of the friends of the patient being awakened to its seriousness.

Health and treatment of Lascar crews who proceeded on foreign voyages.

30. The number of these men amounted to 4,783, and 15 deaths were recorded in the official logs as having occurred among them at sea or in foreign Ports, giving a death-rate* of 3·13 per 1,000, against 4·3 per 1,000 in the preceding year. Enquiry elicited complaints by the crews of six steamers and one sailing vessel to the effect that the rations served out were bad. In the case of the sailing vessel and two of the steamers the complaints were withdrawn at the Shipping Office. Excluding one case in which the existing stock of salt-fish having been proved to be bad a fresh supply was laid in, and one case in which compensation was allowed to the crew for rations proved to have been objectionable, the other complaints were not held by the Shipping Master to have been justified. On this subject the Health Officer writes:—"Seeing the tendency of lascar seamen to make complaints on arrival, which for some reason they withdraw when they are called upon to substantiate them at the Shipping Office at the time of their being paid off, it would be advisable to provide for the hearing of these complaints in the presence of the Health Officer at the time of the enquiry at the Shipping Office. The power given to the Health Officer by the Indian Merchant Shipping Act, 1883, which came into force on the 1st January 1884, to require any person examined to make a declaration of the truth of the statement made by him will also discourage the making of complaints which are afterwards to be withdrawn." Several cases of scurvy occurred in one vessel (the *Bayard*) from Demerara, but the lime-juice was found on analysis to be of good quality.

General health of the Province.

31. According to the local reports, the districts occupy, with regard to general health, the relative positions assigned to them below. The asterisks denote that the

districts thus indicated were more unhealthy than they were in previous years.

The returns indicate that the great majority of the districts improved in health during the year, due to the mitigated severity with which cholera, fever, and bowel-complaints prevailed, particularly the first-named disease, which was widespread and carried off a very considerable number of the population in 1882. The year under review was one in which the harvest, particularly rice, the chief of the staple articles of diet, failed generally to a great extent, owing to deficient, early cessation, or, in a few cases, to excessive rainfall, and as a consequence the prices for food-grains rose (*vide* table in the margin, which also exhibits the rainfall)—a state of matters which, in ordinary course, is expected to prove disastrous to the masses, who are generally ill-fed, even in years of good harvest, ill-clothed, ill-housed, and subject to numerous insanitary influences. The harvest was reported to be below the average in every district, except Poori—in some to a large extent—and the prices for food-grains was higher in all except the Burdwan and Balasore districts. The cases, as gathered from the local reports, in which the normal state of living was disturbed by the high prices for food were few, and may be summed up as follows:—At *Maldah* large numbers of the people, especially in the Bhurind tract, used up, owing to the drought, much of their ordinary water-supply in irrigating their fields, reverted to employment in the silk industry, and were asking for employment on the roads under the Road Cess Department. An application, it appears, has been made to Government for a grant of Rs. 20,000 to open out relief works in the affected tracts in the early part of 1884, if it is found necessary to do so. It is said that at *Khulna* the high prices for old rice compelled many to use new rice, and this is suspected to have increased disease. At the *Jehanabad sub-division*, in Hughli, the rise in the price of food-grains had, to a certain extent, told upon the poorest classes who had to live on short rations. At *Lohardugga*, in order to ward off the effect of the diminished food-supply on public health, relief works were to be started by the Zemindars and Road Cess Department. At *Durbhanga* it is suspected that, owing to the high prices for food, the poor, particularly in the Tajpore sub-division, had a very severe time to go through, and it is expected that this state of things will affect the public health during the current year. At *Monghyr* the same suspicion and opinion are entertained as at Durbhanga.

SECTION VI.

HISTORY OF THE CHIEF DISEASES.

CHOLERA.

Extent of prevalence and fatality of Cholera.

32. The statistics, supplemented by local opinion, indicate that the prevalence and fatality of this dire disease had happily diminished to a very considerable degree during the year under review, in comparison with its incidence during the preceding year, as well as during the quinquennium 1878-82. The following figures support these observations. The disease was present in all the 648 registering circles in the Province excepting 46, prevailing epidemically in only 47 against 115 in 1882, severely in 64 against 118, and mildly in 491 against 376; and it attacked only 6·55 per cent. of the villages against 10·98 per cent. The casualties amounted to 90,439 and the death-rate to 1·36 per 1,000 of population, the reduction on the figures of 1882 being 91,913 deaths, or at 1·39 per 1,000, and on the average of the lustrum 1878-82, 16,107 deaths, or at ·25 per 1,000.

Comparative mortality from Cholera in Urban and Rural circles.

33. The subjoined figures demonstrate that the comparative immunity from the disease enjoyed by the Province, referred to in the preceding paragraph, was participated by both the Urban and Rural circles:—

	In 1883.		In 1882.	
	Deaths.	Ratio per *mille*.	Deaths.	Ratio per *mille*.
Urban circles	8,993	3·64	11,830	4·79
Rural „	81,446	1·27	170,522	2·67

Districts which suffered most.

34. Only the 11 following districts suffered conspicuously from cholera against 28 in 1882 with death-rates ranging from 1·96 to 6·21 per 1,000 of population; and of the whole of the districts (45) only 11 returned higher mortality:—

Districts.	Ratio per *mille*.	Excess or deficit, as compared with 1882.	Districts.	Ratio per *mille*.	Excess or deficit, as compared with 1882.
Nuddea	4·69	1·28 D	Backergunge ...	2·40	2·10 D

Shahabad	3·21	1·39 E	Cuttack	1·95	2·24 D
Howrah	3·00	·79 E			

Seasonal influence of Cholera.

35. The dry and hot months of April to June are again found to be the months of greatest suffering from cholera, even in a year in which it prevailed with normal intensity, disturbed by epidemic exacerbations only to a small extent. With a heavy fall of rain in June and again in July, the severity of the disease, as usual, declined. The high mortality in January is a continuation of the epidemic prevalence of December 1882.

Months.	Deaths in 1883.	Months.	Deaths in 1878-82.	Rainfall in 1883.
May	13,187	April	16,555	4·65

		Total ...		58·84

In *Bengal* cholera prevailed with the most marked severity during the months of January to May, and again during October to December, being most severe in the early part of the year in the Western and Eastern districts, excepting Bankura and Birbhum in the former and Chittagong and Noakhalli in the latter, and in the southern portion of the Central districts. Darjiling and Julpaiguri, comprising the northern portion of the Central districts,

suffered most during May to August. In the winter months the areas of highest suffering were Midnapore, Serampore and Howrah, forming a portion of the Western districts, and the southern portion of the Central districts, excepting Murshidabad.

In *Behar* May to August were the months of prominent suffering, and the disease in this form was confined to its western portion, excepting Sarun and Chumparun.

In *Orissa* cholera was active during the whole of the year, except in October and November; January, February, March and July being the most unhealthy.

Chota Nagpore enjoyed great immunity from the disease throughout the year, except during July and August, in which months Hazaribagh and Lohardugga suffered somewhat severely.

Prevalence of Cholera as delineated by the Cholera Map.

36. A reference to the Cholera Map appended to this Report will show that 33 of the sub-divisions suffered epidemically or severely, the death-rates in them ranging from 21 to 176 per 10,000 of population, against 72 in 1882, with death-rates ranging from 21 to 89 per 10,000, and that the undermentioned sub-divisions were almost free from the disease:—

Districts.	Sub-divisions.	Districts.	Sub-divisions.
Manbhum...	... Sudder.	Lohardugga	... Ranchi.
Purneah ...	... Kudwa and Arareah.	Pubna ...	... Serajgunge.

Sarun ...	... Sewan and Gopalgunge.	Singbhum ...	... Sudder.
Noakhalli...	... Sudder, Fenny.	Chumparun	... Bettiah.
Sonthal Pergunnahs ...	Pakour, Dumka and Godda.		

Cholera at Fairs.

37. Cholera did not prevail at the great majority of the Fairs held in the Province, although in several of them no sanitary precautions were adopted to prevent its incidence. The exceptions are few, and of these the fair held in January at Gunga Sagor in the 24-Pergunnahs, which lasted for a week, and where about 98,500 people were assembled and all needful sanitary arrangements made, presented the largest amount of cholera, viz. 34 cases, seven terminating fatally. In the rest of the affected fairs the outbreaks were insignificant. At the Tarkessur fair in Hughli, held twice, there occurred three cases of cholera; at the Kartick Baroni fair in Dacca, eight cases, one death; at the Lakutia fair in Backergunge, "slight—" number not stated; at the Barahpore fair in Shahabad, some—number not stated; at the Sorgesur fair in Bhagulpore, two cases; and at the Baroni fair in the Sonthal Pergunnahs, "cholera with four fatal cases broke out." At all the above fairs sanitary precautions for the prevention of the disease were adopted, except at Lakutea in Backergunge and Baroni in the Sonthal Pergunnahs district. The existence of the latter fair was not known—it was believed to have been held for the first time. In the Gya district 47 deaths occurred among the pilgrims who passed through it, and 5 among the coolies in the depôts.

Incidence of Cholera in the districts.

38. Sketches of general and local outbreaks of cholera and the main facts connected with its incidence in the districts are subjoined.

BENGAL.

Cholera in the Bengal division of the Province.

39. The prevalence and fatality of cholera were greater in *Bengal* than in any other division of the Province, except Orissa. Its records indicate that 54,635 deaths occurred in it during the year under review, representing a death-rate of 1·55 per 1,000 among its population numbering 35,073,770, as opposed to 93,306 deaths, or at the rate of 2·66 per 1,000 in the preceding year. The most unhealthy months were January to May and October to December.

40. *Burdwan.*—In this district there was a very considerable decline in the prevalence and severity of the disease. The deaths numbered 1,767, and the death-rate amounted to 1·26 per 1,000 of population, and 6 per cent. of the villages were affected by the disease—the reduction in comparison with 1882

being 3,509 deaths, or 2·53 per 1,000, and 8 per cent. in the number of villages attacked. But some localities suffered conspicuously. These are noted in the margin. Pilgrims pass through Ranigunge, and the Magistrate notes that good drinking water is not available in many places, the majority of the tanks, which abound in the district, being in an extremely filthy state.

	Ratio per *mille.*		Ratio per *mille.*
Ranigunge town ...	6·76	Kalna town ...	2·10
Burdwan " ...	3·55	Katugram thanah ...	2·10
Purbasthali thanah ...	3·46	Monteswur " ...	1·91
Shahibgunge " ...	3·01		

41. In the *Bankura* district also the suffering was much less. The deaths amounted to 464 against 1,954 in the preceding year, the death-rate to ·44 against 1·87 per 1,000, and the percentage of villages attacked to 2 against 5. The incidence of the disease was notably severe in only the Sonamukhi town and thanah, where 5·70 and 1·73 per 1,000 of the population perished, respectively. It appears that the cholera, which was severely prevalent in the north and east of the district in 1882, disappeared from this area in the cold weather of that year, but continued to prevail in Sonamukhi epidemically up to April 1883, and with subdued severity in May and June, after which it ceased. Both the urban and rural areas of Sonamukhi are very densely populated and filthy, and have numerous foul tanks and cesspools; and the Magistrate says that until this state of matters is remedied this tract will continue to be visited by the disease in virulent form. It was observed that cholera was absent from almost the entire district from July to the end of the year, and that the Khatra thanah entirely escaped the scourge. Wherever cholera outbreaks occurred, the Magistrate made it a point to have tanks set apart for different purposes, drinking, bathing, &c.; the excreta and vomit buried; the cases isolated, &c.,—very commendable action on his part.

42. *Birbhum.*—There was no excessive prevalence of cholera in this district. Only 2 against 10 per cent. of the villages were affected, and the mortality, represented by 297 deaths, or at ·37 per 1,000 of population, against 2,593 deaths, or at 3·26 per 1,000 in 1882, was lower than that of any year within the past decade, excepting 1875. Most of the disease occurred in April and May and again in November and December. The first outbreak was confined to thanahs Dubrajpore and Sakulipore, the latter, situated in the Gangetic valley and on the direct route of pilgrims, suffering most persistently; and the second outbreak chiefly to thanah Soori. It was noted that the Rampurhat town, which has hitherto been very unhealthy and where a severe outbreak of cholera occurred in 1882, exhibited a marked improvement this year, referable, according to the Magistrate, to three of the best tanks having been set apart for drinking and culinary purposes only. The circumstances connected with the attack by cholera, in the Soori town, of Mr. Cockburn, the District Superintendent of Police, and his two grown-up sons, furnished by Dr. Roy, possess some interest. Two days prior to the occurrence there was a solitary case of the disease in the bazar and a few others at a mela at Ramessar in thanah Soori, ten miles north-east. The air was hot, blowing as if from a furnace; the temperature in the shade was 111°; and in such enervating weather father and sons used to go out riding every morning 16 to 20 miles, coming back under a blazing sun, and, soon after their return, quenching their parched throats with successive tumblers of butter-milk and ice. The well in their compound had run dry, and its water, on chemical analysis, was found to contain ·01 of albuminoid ammonia, and was teeming with vegetable fungi and spores. Father and sons fell victims to the disease within 24 hours after attack. Dr. Roy also submits the following facts which came under his personal observation, indicating how important it is to dispose properly of choleraic discharges and to prevent the contamination of the water-supply. He writes: "I have already obeserved that there was no case of cholera in the district in September. By some fortunate coincidence we are in possession of facts to trace its first importation in thanah Soori after that date. The first case occurred in the person of a zemindar of Nagoree (in thanah Soori, population 705) who, in October, went on a visit to a friend in Panagore in the Burdwan district, and stayed with him for three days. In that house, unknown to him, there had been two or three days previously some deaths from cholera. On the third day of his visit he was taken ill with purging, and he straightway returned home, where

the disease developed itself and he died the next day at his own residence. Three members of his house got cholera in succession after two or three days interval of each, and all but one succumbed. A maid servant who washed the clothes of the deceased was the next victim, and then another woman, till it spread in the whole village and created such a panic that the people began to disperse through fright, but not until the spark had been lit in the next adjacent village, which went through a similar ordeal. Wherever the fugitives went, they carried the seed of disease in their train, and I have no doubt it would have formed a very interesting inquiry if it could have been tracked out in its predatory ramble. Thus Dubrajpore, Rajnuggar, Madhyepore (thanah Soori, population 436), and other villages came to be affected in their turn, and each contributed its mortality. In Kaniepore, three miles west of Soori, with a population of 723, there occurred seven deaths out of ten cases, out of which five occurred in one house, two in another, and three in separate houses amongst their neighbours. It turned out on personal investigation that the first case occurred in a house four days after a man and wife with two children came and took shelter from Madhyepore when cholera was raging in that village. None of these, however, got the disease, but a child of their host, who recovered. This was followed by four cases in that house and five more in other houses, as have been detailed above. Whether to call this simultaneous outbreak a coincidence, or that the appearance from infected locality only hailed the advent of the disease through the medium of clothes, is more than I am in a position to state. For if the latter point is conceded, it indicates strongly the necessity and importance of quarantine in cholera. Now all these cases occurred within a limited area, whilst the village Kuddea (thanah Soori, population 1,924) separated from it by the intervention of a road, and having more than double the population, and conspicuous by absence of any sanitary arrangement, escaped without a single occurrence. Kaniepore is inhabited by Mahomedan population. They have a tank in their midst, which serves for drinking, washing and culinary purposes. They said their females being zenanas, could not go any distance to fetch water. They unhesitatingly declared that they washed their clothes, soiled with the discharge of patients, in that very tank which is used by the majority of the people for drinking. I say majority, because some have got wells in their houses which they exclusively use; and it is a noteworthy phenomenon that no case of cholera occurred in those families. If, with these facts, which are similar to those I have reported year after year, one still denies the communicability of cholera, it can be explained on the view that nothing is more difficult than to convince the sceptical."

43. In the *Midnapore* district the percentage of villages covered by the disease was the same as in the preceding year, viz. 7, the deaths numbered 3,766, and the death-rate was 1·49 per 1,000 of population, against 3,460 and 1·37 per 1,000, respectively. January to May and November and December were the worst months. Thus it is seen that there was an accession of the disease during the year under review, and the Civil Surgeon is of opinion that it is gradually increasing. It did not prevail epidemically, but scattered sporadic outbreaks were frequent.

Khajri ,,	4 20	Suttahatta thanah ...	1 97
Nundigram ,,	4 06	Chundrakona ,, .	1 91

The areas of greatest suffering are marginally indicated. The Civil Surgeon notes that the portion of the district bordering on the sea and the river Hughli, (such as Raghunathpore, Khajri, Contai, Ghattal and Suttahatta) as usual, suffered very much, and the Magistrate observes that in this littoral tract there is almost everywhere a great want of good drinking water. The disease was specially prevalent in March in villages Khorar and Woodoygunge in the Ghattal sub-division. These villages are particularly filthy, very densely populated, and in great need of sanitary arrangements. An outbreak which occurred in the Dantun thanah is said to have been originated by pilgrims. Binpur and Garbetta suffered the least from the malady, and this immunity is attributed to the fact that these thanahs are largely inhabited by Sonthals who are far more particular than other natives about the water they drink. At the instance of the Magistrate, and under sanction of Government, pilgrims are now prevented from passing

through the town of Midnapore, and are compelled to use the road without the town, which was provided for them long ago but which they did not generally use.

44. *Hughli.*—In this district 1,352 deaths were recorded, or at the rate of 1·33 per 1,000 of population, and 9 per cent. of the villages were attacked. The corresponding figures of the preceding year are deaths 1,473, death-rate per 1,000 1·45, percentage of villages attacked 13. Excluding Serampore, the mortality in Hughli was somewhat higher in comparison with 1882. The months of greatest suffering were January to May and October to December, and the places named in the margin suffered with marked severity. It will be observed that the disease in its severest form was almost confined to the towns. Of local outbreaks one occurred in the cooly depôt at Champdani brick-fields, and was attended with 27 deaths, and another with 17 fatal cases took place among the coolies working on the Railway line near Tarkeswar. The latter outbreak ceased as soon as the unaffected coolies deserted, and it was attributed to the fact that a large number of them were crowded together without latrines or sanitary arrangements of any kind. A few cases of the disease were observed in March among the coolies of Messrs. Shaw, Finlayson and Company at Mugra. These coolies were travelling from Ranigunge by rail to Dhubri *viâ* Mugra. The Agent of the Company omitted to take proper care of the patients, and was prosecuted and fined on conviction. Steps were promptly taken to arrest the progress of the disease. At Serampore it was remarked that the winter prevalence of the disease was this year of a very severe and fatal type.

45. In the *Howrah* district the disease prevailed more extensively and fatally than in the preceding year. 24 per cent. of the villages were overrun by it against 17 per cent., and the deaths amounted to 1,909, or at 3·00 per 1,000 of population against 1,407, or at 2 21 per 1,000. January to May and October to December were the most fatal months, and the marginally noted areas furnished the highest mortality. No information has been offered by the Civil Surgeon relating to the cholera history of the year, except that the malady did not prevail epidemically.

46. 24-*Pergunnahs.*—In this district cholera prevailed with nearly the same severity as in the preceding year; but it was considerably less widespread. The recorded mortality was 6,499, or at 3·47 per 1,000 of population against 6,622, or at 3·54 per 1,000, and 16 per cent. of the villages were affected against 20. The largest number of deaths occurred during the months of January to May and October to December, and the areas of greatest suffering are those mentioned in the margin. It will be noticed that the Suburbs of Calcutta heads the list. During every year of the past decade, excepting 1880, the mortality from cholera in this large and important Municipality has been very high, ranging between 7 and 12 per 1,000 of population. In my recent inspection, while observing many commendable improvements which had been effected in it, I noticed the existence of many insanitary conditions which no doubt favour cholera outbreaks. The Civil Surgeon reports that the disease has been observed to prevail annually in October, with marked severity, in some of the villages in Cossipore and Chitpore in this Municipality; that in these localities coolies congregate for employment during the jute season, that there being no houses available, they put up rough temporary huts in which they live crowded together without any regard to sanitation; and that when cholera breaks out, the early cases generally occur among them. At Entally, in the same Municipality, the cholera mortality is swelled by the inclusion in it of the casualties occurring in the Campbell Hospital, which, while it admits patients

from every part of Calcutta, records deaths at the Entally thanah, within the boundaries of which it is situated. An outbreak of cholera occurred in the commencement of the year at the Railway cooly depôt at Nagra, and spread gradually over nearly the whole sub-division of Diamond Harbour, where it prevailed in almost epidemic form. The mortuary records indicate that this outbreak continued up to June, lingered with subdued severity during July, August and September, and resumed its original activity during the remainder of the year. On the 21st March the Agent to the Eastern Bengal Railway Company reported that cholera had broken out at Kanchrapara among the coolies proceeding to Assam, among the railway workmen, in the bazar, and in the villages adjacent to Kanchrapara. The affected localities were stated to be extremely filthy, defœcation being carried on anywhere and everywhere, and the water-supply from the tanks and railway cuttings very bad. It was suspected that this and all such outbreaks of the disease were introduced by these coolies, who it appeared were not, as before, medically examined before being allowed to leave Sealdah. Upon receipt of this report the Magistrate of the 24-Pergunnahs was desired to adopt immediately the necessary steps to put the place into a proper sanitary condition, and to report the arrangements he would suggest for the proper care, treatment, and medical examination of the coolies, and the Deputy Sanitary Commissioner, Metropolitan Circle, was requested to proceed to Kanchrapara and report upon the cholera prevailing there. From the latter officer's report it appeared that the coolies come down from up-country by the East Indian Railway as far as Mugra, walk down to Bansberia, cross the Hughli river, and then join the Eastern Bengal Railway at Kanchrapara; that the batch of coolies referred to by the Agent of the Eastern Bengal Railway had, on arrival at Kanchrapara, two cases of cholera among them, of whom one died at the station and the other at the cooly depôt; and that the disease broke out among the large body of workmen of the Eastern Bengal Railway and also among the coolies belonging to a contractor—the general inference being that coolies passing Kanchrapara bring cholera and other diseases with them. It appeared, moreover, that no care whatever is taken of the coolies during their journey by rail, and that they are packed in the trains like goods. The Deputy Sanitary Commissioner, Metropolitan Circle, observed that the arrangements made for the coolies were not satisfactory, and suggested that a shed should be provided for them between Mugra and Kanchraparah, where they might rest, have their sick treated, and be medically examined before being permitted to proceed by rail from Kanchrapâra; those found unfit for the journey being detained. The Magistrate of the 24-Pergunnahs reported that the only feasible plan would be to insist on the establishment of proper depôts by each contractor near or at Kanchraparah, and to appoint a Government Assistant Surgeon for the medical examination and treatment of the coolies, and that his salary should be borne by the contractors at the rate of two annas per cooly examined. The whole question was submitted to Government for favourable consideration of the above suggestions, and with a further recommendation that, as the coolies travel by rail in batches of 100 to 200, a native medical subordinate be deputed to accompany them, with instructions to separate from their number, at convenient stations along the line, where proper medical attendance can be secured, any that may be attacked by cholera, &c., during transit. A smart outbreak of the disease was reported to have occurred in October in the villages of Guriffa and Nyehatti on the east bank of the Hughli river opposite Chinsurah. On enquiry the Civil Surgeon illicited the following facts: The disease was almost entirely confined to the village inhabited by the coolies working in the Gouripore Mills, and was suspected to have been imported from Bally. The Gouripore village consists of large, roomy, mud huts, situated on high land, a small bund or embankment separating it from the village of Guriffa, where only three cases had occurred from the 8th, the date the disease appeared, up to the 19th, the date of the Civil Surgeon's visit, against 42 in the mill village, although the former is situated on lower land, embeded in jungle, and contains foul tanks. There were about 2,000 workmen, of whom rather more than half lived in the Guriffa village and the remainder in the mill village. These people, both men and women, indulge in intoxication in country spirits, of which a plentiful supply is obtainable. They earn

Rs. 12 per mensem, of which they spend Rs. 4 in liquor. The mill Native Doctor attended the sick at their houses. This the Civil Surgeon considered a bad arrangement, amounting almost to no treatment at all, and suggested that a hospital be provided, where the sufferers could be treated systematically, and where their clothes, excreta, vomit, &c., could be properly dealt with. The Mill Manager and the local officers exerted themselves energetically to arrest the progress of the disease. The Municipality employed persons to clear the jungle and drains, and served notices to several people to clean their tanks and remove the filth, &c., from their houses. The Sub-divisional Officer, under the orders of the Magistrate, caused the Police to see that dead bodies were buried or burnt immediately after death, with clothes and bedding; that the clothes, &c., of the sick are not washed in the river or tanks; and to prosecute people committing nuisances.

47. The *Nuddea* district heads the list of districts most severely affected by cholera during the year under review; but, in comparison with the preceding year, a marked decrease is observed in both the prevalence and fatality of the disease. The area covered by it is represented by 35 per cent. of the villages against 52 per cent., and the mortality amounts to 7,771, or at 4·69 per 1,000 of population, the figures of 1882 being 9,901 deaths, or at 6·58 per 1,000. The months of severest suffering were January to May and November and December, and the most conspicuous death-rates were presented by a large number of the registering circles—*vide* the following list:—

The Civil Surgeon's report again furnishes no special information bearing on this epidemic, except that it was noticed that the towns suffered more severely than the rural areas, an observation which is not supported by the mortuary figures.

48. *Jessore.*—In this district 15 against 27 per cent. of the villages were affected by cholera and 4,293, or 2·21 per 1,000 of the population died, against 10,676, or 5·50 per 1,000 in 1882, showing that the severity of the disease had declined considerably. Nevertheless, the circles named in the margin furnished very high death-rates. The months in which the highest mortality occurred were January to May and December. The sanitary reports furnish no particulars regarding the severe suffering in these areas.

49. The *Khulna* district presented 1,695 deaths, or at 1·56 per 1,000 of population from 17 per cent. of the villages. The corresponding figures of the preceding year were 3,299 deaths, or at 3·05 per 1,000, and 22 per cent. of villages attacked: thus indicating a great decline in both the prevalence and fatality of the disease. The unhealthiest months were January to May and November and December, and the areas of greatest suffering were the two named in the margin. The disease prevailed in sporadic form, and was nowhere epidemic. Of local outbreaks the following are cited:—Eleven cases with six deaths occurred in December among the coolies employed in the Government brick-field. The atmosphere was at the time loaded with moisture, consequent on a few showers having fallen a few days before, followed by others up to the 31st December. The coolies were crowded in their huts; they consumed new rice and inferior food; and the ground was damp. A smart outbreak occurred in the Kendla village in the Bagirhat sub-division. It originated in a boy who had gone to Debirhat,

	Ratio per *mille.*
Assasuni thanah	3·81
Paikgacha „	3·80

situated on the river bank on the boat route between Bagirhat and Khulna, and was there attacked. He was at once brought home by a fellow-villager, who also was affected by the disease the same day and died. After this, it spread rapidly in the village, which was in a very insanitary condition. No care was taken to arrest the progress of the disease; on the contrary, bedding and clothes, tainted with cholera excreta, were washed in the ponds used for drinking purposes. It was noted that cholera was not present in Debirhat nor in the adjacent villages when the boy visited the locality.

50. In the *Murshidabad* district the severity of the disease had diminished notably. Only 6 per cent. of the villages were affected by it, and 1,181, or ·96 per 1,000 of the population died, against 16 per cent. of villages attacked and 3,583 deaths, being at the rate of 2·92 per 1,000, in 1882. April and May were the worst months, and the areas named in the margin were the unhealthiest. The sanitary reports do not contain any noteworthy particulars referring to the disease, except that in a severe outbreak of the disease which occurred in city Murshidabad in April, in addition to the measures adopted by the Municipality to afford relief to the sufferers and to arrest the progress of the disease, the Nawab Bahadoor of Murshidabad entertained three medical practitioners to visit the sick in their houses, caused a large tank at the back of the Nizamut stables and several other tanks in different parts of the city to be cleaned out and thrown open to the public for the supply of water for drinking and culinary purposes.

51. *Dinagepore.*—In this district cholera exhibited no marked severity. It was confined within only 1·53 per cent. of the villages, and the mortality amounted to only 641, or ·42 per 1,000 of population. It prevailed with some severity during the months of May and June, the other months of the year being almost free from it. It was entirely absent from the Dinagepore town, and the only localities which suffered in any degree approaching to severity were thanahs Gungarampore (1·71 per 1,000), Porsha (1·62 per 1,000), Parbatipore (1·57 per 1,000), and Bansihâri (1·07 per 1,000). Pilgrims from Cooch Behar from both sides of the Teesta river passed through Parbatipore *en route* to Maldah. The disease was raging in Maldah, and the Civil Surgeon says that these pilgrims on their return introduced it to Parbatipore. The Magistrate adds that in his experience this was the worst cholera year in Cooch Behar, and that the pilgrims who go at a certain time every year to deposit a piece of bone from the body of any of their relatives who may have died, in the sacred water of the Ganges, frequently bring back with them the seeds of cholera. Gungarampore is situated on the left bank of the Purnabhaba river where traders from Maldah congregate, especially in the Nya Bazar, the trade centre of the locality. At Porsha boats from other localities assemble.

52. *Rajshahye.*—There was less cholera in this district than in several previous years. The returns of this year record 2,079 deaths, or at the rate of 1·55 per 1,000 in 7 per cent. of the villages against 2,789 deaths, or at 2·08 per 1,000 in 9 per cent. of the villages in 1882. The worst months were January, March to May, and November and December, and the areas given in the margin suffered the most. The sanitary reports do not furnish any information of interest worthy of reproduction here.

	Ratio per *mille.*		Ratio per *mille.*
Charghat thanah ...	4·42	Panchpore thanah ...	2·35
Putia „ ...	2·98	Beauleah town ...	2·07

53. In the *Rungpore* district there was a small accession of cholera. The deaths numbered 2,134 against 1,770, the death-rate amounted to 1·01 per 1,000 against ·84 per 1,000, and the percentage of villages affected was four against three in 1882. The disease attained epidemic intensity in May, prevailed virulently throughout June and July, and lasted with considerably abated severity to the end of the year. Singularly, it was during the three months of severest suffering (May to July) that the largest amount of rain fell, *viz.*, 34·43 inches against 29·75 during the remaining nine months. The only registering circles which returned noticeably high death-rates are thanahs Ulipore (2·40 per 1,000) and Nageshwari (2·35 per 1,000).

54. *Bogra* and *Pubna.*—There was very little cholera in these two districts, and compared with 1882 there occurred a considerable abatement of the disease, particularly in the latter district. None of the registering circles in either suffered with any noticeable severity. The figures illustrating these observations are given in the margin.

	Deaths.		Ratio per *mille.*		Percentage of villages attacked.	
	1883.	1882.	1883.	1882.	1883.	1882.
Bogra	215	1,461	·33	1·98	2	6
Pubna	239	5,123	·18	3·90	2	22

At an outbreak of the disease in the village of Thontonia, close to the southern limit of the Bogra Municipality, it was ascertained that a very unwholesome tank existed in the centre of the village and a great deal of jungle in its neighbourhood which shut out both light and air, and that cow-dung had been accumulated very largely for manure in the compound of the house in which the disease first appeared. In Pubna the disease prevailed sporadically throughout the year, except in January, when it was slightly severe as a continuation of the outbreak which was actively prevalent during the latter half of 1882. Dr. Dutt says that the disease is not connected in any way in this district with pilgrimages.

55. *Darjiling.*—In this district cholera prevailed severely; considerably more so than during several past years. The reported deaths amounted to 332 in 8 per cent. of the villages, against only 55 in 1882, and the death-rate to 2·12 against ·35 per 1,000 of population. The months in which the disease prevailed most virulently were May to August. In fact, it may be said that it was limited to these months, the other months exhibiting very little of it. The areas which furnished the highest deaths were thanahs Kurseong (3·78 per 1,000), Phansidewa (2·87 per 1,000), and Darjiling (·97 per 1,000). The Civil Surgeon has good reason to believe, from data collected from some of the tea gardens, that the recorded mortality has been greatly under-stated. He estimates it at ten times the rate returned by the Police. Commencing in the Terai, the disease spread over the whole district with epidemic virulence, excepting the large hill tract east of the Teesta and several villages west of that river. Localities which had not been visited since 1877 were invaded this year; tea gardens and other places further in the hills than Darjiling were attacked; plains and hills were both affected; the Darjiling Municipality, at an elevation of over 7,000 feet, did not entirely escape. No particular rule was followed by the disease; it visited one garden or some particular cooly lines in one garden, while it was absent from the next garden with coolies living under very much the same conditions as in the affected garden. The Civil Surgeon, Dr. Joubert, states that in all cases that came under his personal observation the disease appeared to break out in places where some local insanitary condition existed, such as accumulation of filth, overcrowding, contaminated water-supply; or it resulted from some indiscretion in diet. He instances the following cases in support of this statement. At the Tumsong busti, where some cases of cholera occurred, the first (with fatal result) in the person of a stranger who had only come from Nepal three days previously, the water-supply is obtained from springs and is of bad quality; but it was remarked that after hydrant water had been supplied to the inhabitants by means of bamboo pipes, no fresh cases occurred among them. About a mile from the Railway station of Kurseong an outbreak occurred, during which five natives and one European died. The water-supply for both Europeans and natives in this place is taken from a Jhora (hill stream) coming down from Dow Hill, which is exposed to much contamination almost from its source, viz., from jungle to which the natives resort for defæcation, and from pigstyes and stables. The Garidhura and the Longview tea estates were specially affected. In the former 86 deaths occurred, and in the latter 69. In Garidhura large hâts are held, its sanitary condition is bad, and it lies very low on the banks of the river. Dr. Joubert further observes that in no case did he notice a tendency of the disease to spread to other persons than those living under the peculiar conditions which seemed favourable to the development of cholera during this year in which it exercised an epidemic influence, although these insanitary conditions were not peculiar to this particular year, the people among whom the cases occurred having lived for years past when no cholera occurred, and will no doubt live

in the same way till cholera again visits the hills. But he asserts that the disease, in whatever form it travels in years of epidemic occurrence, finds a favourable spot for its full development in such places, and sporadic cases occur during the prevalence of an epidemic influence. In support of this view of the question the Deputy Commissioner quotes the cases of two tea gardens, the Tirihana in the Terai and Longview at an elevation of about 1,200 to 2,000 feet. The former is always attacked by cholera, and the latter suffered during the year under notice and when the disease was last epidemic in the hills.

56. *Julpaiguri.*—This district also suffered very severely. It is the second on the list of districts in which cholera prevailed with the greatest virulence. The diseaso overran 19·87 per cent. of the villages against only ·72 in 1882, and the mortality stood at 2,430, or 4·17 per 1,000 of population against 33, or ·05 per 1,000. May to September were the unhealthiest months, and the arears which suffered the most are those named in the margin.

	Ratio per *mille.*		Ratio per *mille.*
Salbari thanah ...	21·29	Mynaguri thanah ...	4·60
Julpaiguri town ...	12·07	Patgram „ ...	3·58
Alipur thanah ...	11·65	Kairanti „ ...	2·95

Nothing particularly worthy of record was reported regarding the severe prevalence of the disease in this district, excepting that it set in with virulence with the May rains, which fell during 20 days in that month as compared with 11 days in the corresponding month of the previous year; that thanah Boda, which enjoyed immunity during the months when the disease was severely afflicting the district, was attacked in September, when it had abated considerably; that a virulent type broke out in the Nyabasti village close to the Railway station, and in some of the tea plantations in the Duars; and that the disease is generally believed to have travelled viâ Cooch Behar.

57. *Dacca.*—In this district the incidence of cholera had abated very considerably. It affected only 10 per cent of the villages against 19 in 1882, and the deaths fell off from 6,334, or 2·99 per 1,000 to 2,197, or 1·03 per 1,000. As usual the worst months were January, March and April. Only the Keranigunge thanah and the Naraingunge town suffered with anything like conspicuous severity, the death-rates returned by them being 2·74 and 2·22 per 1,000 of population, respectively. Referring to the theory of cholera epidemics being influenced by human intercourse, Dr. Crombie quotes the following cases as disproving it. A severe outbreak of the disease occurred in Keranigunge on the opposite side of the river from Dacca. At this outbreak it was observed that, although there is the freest communication between this place and the Dacca town, ferry boats, conveying clerks and others, constantly plying between the two places, Dacca was comparatively freer from the disease. Similarly, while rather serious outbreaks occurred in Raipura and Rupgunge, which lie on either side of the river Lakhya, and between which and Naraingunge, the great jute centre of Eastern Bengal, situated at the mouth of that river, there is a constant river traffic, only 29 cases took place in Naraingunge thanah: but the town of that name suffered rather severely.

58. *Faridpore.*—In this district also the suffering was considerably less severe than in the preceding year. Two thousand and seventy-nine deaths, or at 1·27 per 1,000 of population were recorded in 12 per cent. of the villages, against 5,038 deaths, or at 3·08 per 1,000 in 21 per cent. of the villages. The seasonal incidence of the disease was the same as at Dacca, and the areas of highest mortality were the thanahs of Madaripore, Goalundo, Kotalipara and Gopalgunge, and the town of Faridpore, in which the death-rates amounted to 2·71, 2·46, 2·02, 1·92, and 2·04 per 1,000 of population, respectively. Referring to the great immunity from the disease which the district enjoyed during the year under review as compared with the preceding year when hundreds of villages had been attacked, the Civil Surgeon observes "if there is a specific cholera germ, the germ of the disease had been [in 1882] sown broadcast in those villages by the burial of the deceased within the compound of the houses and near tanks and other reservoirs of water, by keeping the soiled clothes of the deceased, or washing them in tanks and other reservoirs, by throwing the ejections of the deceased all over the place, and by allowing

the house and its furniture to remain infected. Here we have the locality and the germ of the disease, and yet it did not crop up" [in 1883].

59. In *Backergunge* 26 per cent. of the villages were attacked, and the deaths and death-rate amounted, respectively, to 4,566 and 2·40 per 1,000 of population, the corresponding figures of the preceding year being, villages affected 31 per cent, deaths 8,570, and death-rate 4·50 per 1,000, indicating a great reduction of sickness and mortality. The months in which the largest mortality was returned were January, February to April, and November and December; and the marginally noted areas experienced the highest suffering. It was remarked that in this district the period during which the disease exhibits greatest activity corresponds with the period during which the least rain falls. It is during this time that the water in the tanks from which the drinking supply is preferably taken, becomes, by evaporation, foul, or little better than diluted sewage.

Jhalokati „ ...	3·08		

60. *Mymensing.*—In this district the disease prevailed with diminished severity. The percentage of villages attacked amounted to 9 against 6 in 1882; the deaths to 3,848 against 5,998; and proportion of deaths to population to 1·26 against 1·96 per 1,000. January to June were the worst months, and thanah Netrakona and Kishorgunge town returned the highest death-rates, viz., 3·74 and 2·86 per 1,000 of population, respectively. No information, possessing any special interest, was submitted for this district, except that the absence of the disease in its severe form in the winter was unusual and remarkable.

61. *Chittagong* and *Noakhalli.*—There was very little cholera in these districts, and the mortality was low. Contrasted with 1882 much diminution is seen, notably in Chittagong. The table given in the margin illustrates these facts. In Chittagong March was an unhealthy month, but in Noakhalli no month claimed this pre-eminence, the disease having prevailed in it in a sporadic and scattered form.

	Deaths.		Ratio per *mille.*		Percentages of villages attacked by the disease.	
	1883.	1882.	1883.	1882.	1883.	1882.
Chittagong ...	830	2,714	·29	2·40	5	21
Noakhalli ...	90	268	·10	·32	2	6

62. In the *Tipperah* district the disease prevailed with somewhat lesser severity than in the preceding year. The percentage of villages affected was 8 against 10; the deaths numbered 2,431 against 2,665; and the casualty-rate amounted to 1·60 against 1·75 per 1,000. The severity of the disease was confined to the first five months of the year, for in June it abated suddenly and sensibly, and continued at a low ebb throughout the remainder of the year. This is said to be contrary to past experience, for in this district while the disease is always present in some part of it throughout the year, it sinks into endemic insignificance during the hot season and rains, and rises to epidemic activity during the cold season. In the areas noted in margin the disease proved most fatal.

BEHAR.

63. In this division of the Province the prevalence and fatality of cholera was greater than in Chota Nagpore, but lesser than in Bengal and Orissa. The mortality is represented by 27,568 deaths, or at the rate of 1·19 per 1,000 among a population numbering 23,127,104, against 70,448 deaths, or at 3·04 per 1,000 in the preceding year. May to August were the unhealthiest months.

Cholera in the Behar division of the Province.

64. *Patna.*—In this district the disease exhibited considerably abated virulence in comparison with the preceding year. Nine per cent. of the villages were

affected against 18 per cent.; 2,252 persons died against 5,078; and the death-rate was represented by 1·28 per 1,000 of population against 2·89 per 1,000. The months of greatest suffering were April to August; and in the circles named in the margin the highest mortality occurred.

	Ratio per mille.		Ratio per mille.

Patna town ...	3·35	Patna „ ...	2·05
Behar „ ...	3·04		

A smart outbreak of the disease occurred in Umbair in the Behar town, and lasted about a month. Here tank water is used, which is said to be stagnant and foul throughout the year. An outbreak in Mokameh town was attributed to importation by Railway passengers. In the Dinapore Cantonment and the Nizamut chowkidari unions, as well as in several surrounding villages, the disease broke out epidemically. The troops were moved out of the cantonments. Its epidemic prevalence was also felt in the Patna and Futuha towns, and in the Patna and Mokameh rural circles; but the malady does not appear to have proved conspicuously fatal in Futuha and Mokameh.

65. The *Gya* district holds the third position on the list of cholera-stricken districts. The disease prevailed in it very extensively and fatally, and to a much greater extent than in the preceding year. Nine per cent. of the villages against 5 per cent. was overrun by the disease, and the deaths amounted to 7,937, or at the rate of 3·73 per 1,000 of population against 4,995, or 2·35 per 1,000. The circles which presented the highest death-rates are those named in the margin. It exhibited epidemic intensity during April to September almost throughout the district, after which it abated gradually. It broke out simultaneously in very many villages far distant from each other; and exercised unusual virulence in the Aurangabad and Sudder sub-divisions, specially in the former, where the disease took its rise; and in the Jehanabad and Nawada sub-divisions, but to a lesser extent, thanahs Nawada, Pakribrawan, and Rajauli in the latter sub-division escaping this influence.

The Civil Surgeon visited many of the affected localities, but could obtain nothing beyond negative evidence as to the causation of the disease. In no instance, however, was it be traced to importation. It appeared to him that the disease spread irrespective of lines of traffic, and that the prevailing winds did not influence its course; but that rather while during the earlier part of the outbreak the prevailing wind was west, the progress of the epidemic was from east to west. Mr. Skrine, the Magistrate, is inclined to believe that the progress and virulence of the disease was fostered by the filthy habits and overcrowding of the population. The Rajah of Deo distributed medicines gratis, and Babus Sham Lall Mitter and Nundo Lall Bose, zemindars, engaged a medical practitioner and provided medicines for the relief of their tenants.

66. In *Shahabad*, as in Gya, the disease exercised an extensive epidemic sway, and proved very fatal to life. It attacked 12 per cent. of the villages and killed 6,379 people, or at the rate of 3·24 per 1,000—the highest mortality on record since 1876. The figures of 1882 were, percentage of villages attacked 8, deaths 3,617, death-rate 1·85 per 1,000. The areas which suffered most severely are indicated in the margin.

Bhabua „ ...	4·27	Belauti „ ...	2·14

The district was practically free from the scourge during the first quarter of the year; but during the hot weather and rains, from May to September, it prevailed epidemically. In April it was reported to be present, with some severity, in the Piru thanah in the south of the district. Early in May it attacked the village of Berahpore in thanah Domraon in the north, in which and its neighbourhood a crowded fair was being held. The first case occurred among the permanent residents of the village, and from them this disease spread to the assemblage at the fair. Those who camped out of the fair did not suffer. The fair was broken up, and the people dispersed, carrying, according to the Civil Surgeon, their sick with

them, notwithstanding that a hospital had been established at the fair and a native doctor with medicines provided. By the end of May the disease had spread to every thanah in the district. In June it was at its height. During July its severity was also great; but from August it declined. The Magistrate doubts if, as above stated, any of the sick were carried away, and he thinks it would be a mistake to infer that the origin of the outbreak is referable to the fair. The Civil Surgeon has very little doubt that the mortality at this outbreak had been understated, and he believes that only three-fourths of the actual number of casualties were recorded.

67. *Mozufferpore.*—In this district the prevalence and fatality of cholera had diminished very considerably in comparison with its incidence in the preceding year, when it was epidemic over a large area of the country. In 1883 it was present in 6 per cent. of the villages against 22 per cent. in 1882; the casualties amounted to 3,427 against 12,109, and the proportion of deaths to population was 1·32 per 1,000 against 4·68. The mortality was highest during the months from May to October, and only the five circles named in the margin suffered with any approach to noticeable severity. The sanitary reports of the district do not contain any information worthy of record.

	Ratio per mille.		Ratio per mille.
Hajipore town ...	3·85	Pupri thanah ...	2·19
Mozufferpore " ...	3·83	Lalgunge town ...	2·02
Sitamarhi thanah ...	2·80		

68. *Durbhanga.*—This district also enjoyed, on the whole, marked immunity from the disease. The percentage of villages affected by it was 4 against 23 in 1882, the deaths numbered 2,779, or at 1·05 per 1,000 of population against 10,916, or at 4·14 per 1,000. The only areas that presented high mortality were the Benipati rural circle and the Durbhanga town, where the death-rates amounted to 4·26 and 2·57 per 1,000 of population, respectively. The malady prevailed very badly in Harlaki and Deodha on the borders of Nepaul, whence it travelled a distance of about 20 miles. This outbreak is said to have been introduced from a fair at Janakpore in Nepaul, five miles from the frontier, where 50,000 pilgrims assemble every year, and where no preventive or sanitary measures are even thought of by the Nepal authorities. A remarkable feature presented by the disease this year was that, while it was conspicuous by its absence from the beginning of the year up to April, in the latter end of that month it broke out only in thanah Nagurbusti, and spread during the next month *all over the district* (not a single thanah escaping); reached maximum severity in the early part of June; and rapidly abated after a heavy (9·1 inches) fall of rain on the 17th of that month, and continued declining up to September, after which it entirely disappeared. The rainfall during June, July, August and September was 15·86, 10·07, 11·18, and 3·42 inches, respectively. The Civil Surgeon, Dr. Gilligan, notes that the record for years and long observation indicate a prevalence of the disease when the weather becomes dry and hot, its advent dating in April, and that during the prevalence of such weather it goes on increasing in virulence, and is only arrested at the setting in of the rains. He exhibited commendable forethought, energy, and care in advising and adopting measures for the suppression of the disease in the town of Durbhanga, where it prevailed severely. In this he was greatly assisted by the local authorities.

69. *Sarun* and *Chumpurun.*—In both these districts the disease prevailed with remarkably abated severity in comparison with its incidence in 1882, particularly in the latter, as the marginally noted figures show. The months of maximum intensity of the disease were May and June in Sarun and September in Chumparun, but no circle in either district exhibited noticeably high death-rates.

	Deaths.		Ratio per mille.		Percentage of villages attacked.

Sarun	1,114	3,534	·48	1·54	4	10
Chumparun ..	529	5,362	·30	3·11	1	6

70. *Monghyr*, *Bhagulpore*, *Purneah*, *Maldah* and *Sonthal Pergunnahs.*—The phases exhibited by the disease in these districts during 1883, in comparison with those which obtained in the preceding year, may be considered together, as they are identical, the differences being few. The mortality in all these districts had diminished, pre-eminently in Bhagulpore and

Purneah, and the areas covered by the disease, as represented by the percentages of villages attacked, presented the same feature, except that in Maldah and Monghyr a larger proportion of the villages were affected. These observations will be found illustrated by the table in the margin. In seasonal incidence only Maldah and Purneah exhibited periodical exacerbations, the former during the months of January, April and May, and the latter in June and August. In point of fatality a few of the circles in these districts furnished high death-rates. These are named in the margin. The leading features connected with the aspect of the disease presented by some of the districts are subjoined. In *Monghyr* it was noticed that nearly a third of the total casualties (278 out of 875) occurred in the towns of Monghyr and Jamalpore. The Civil Surgeon of *Maldah* writes:—"The April outbreak of cholera coincided more or less with the first onset of the rains in that month, the weather at the same time being cloudy and hot (102°F.), and the prevailing wind easterly. In such a case after a spell of dry, hot weather of six weeks' duration, the first showers would of course start decay into activity, and thus aid the propagation of disease." In the *Sonthal Pergunnahs* the disease broke out in April and, as usual, suddenly in several villages separated by long distances, without spreading from one village to another; and was most fatal in this month. There was a decline in May, which continued till September, but in October and November the severity of the disease was again felt, December showing but a few cases. Of the local outbreaks, the following may claim attention. In the sub-division of Deoghur, excluding several small outbreaks, the noticeable one is that which occurred in June in village Goradi, six miles south of Madhupore thanah, which gradually extended to several neighbouring villages, and in which 154 persons were attacked and 141 died. The town of Rajmehal suffered severely, particularly in April, when the disease lasted six weeks and was attended with 30 cases and 23 casualties, and again in November, when it lasted three weeks, attacked 73 persons and killed 38. Excluding sporadic cases, two severe outbreaks occurred in the town of Sahebgunge, one in May attended with 31 cases and 27 deaths, and the second in October, in which 50 persons were attacked and 25 died. With regard to these outbreaks, it is stated that much traffic goes on at this station and many people, such as coolies, Sonthals, Pahariahs, as well as villagers, from Purneah and Maldah, frequent the municipal market; and that, although the water-supply is good and the conservancy fairly attended to, the cattle sheds and private privies are "badly kept." The inference suggested is that under these circumstances cholera may easily be propagated.

ORISSA.

71. In Orissa cholera prevailed with the greatest severity as compared with its incidence in the other three divisions of the Province (Bengal, Behar and Chota Nagpore). The casualties amounted to 6,631, representing a death-rate of 1·82 per 1,000 among its population of 3,628,832, as opposed to 16,956 deaths, or at 4·74 per 1,000 in 1882. In seasonal fatality every month, excepting November and December, returned a high death-rate.

Cholera in the Orissa division of the Province.

72. *Cuttack.*—This district, in which cholera prevailed most extensively and fatally in 1882, enjoyed comparative immunity this year. The percentage of villages attacked was 7 against 13, and the mortality reached 3,502 of the population, or at 1·95 per 1,000 against 7,296, or 4·19 per 1,000. In 1882 every circle in the district, 12 in number, returned noticeably high death-rates;

this year only the six named in the margin suffered similarly, although pilgrims, as usual, passed through the district during the principal festivals. It was observed that the greatest mortality occurred among them in January and February, and again in June and July at the time that the Dole Jatra festival is held; that the thanahs from which the highest number of casualties were returned, viz., Aul, Patamundi, and Kendrapara, excepting Salipore—which did not suffer very conspicuously this year—constitute the roads taken by the pilgrims from Chandballi to Cuttack; that Tirtol, which is not situated on the pilgrim route, exhibited a lower death-rate; that the local pilgrims who attend the abovementioned festival often disseminate the disease in their villages; and that the spread of the disease in the villages is due not only to the insanitary conditions that obtain in them, but also to the contamination of the water-supply by the washing in it of excreta, soiled clothes and bedding of the cholera-stricken, which the people in their ignorance, carry to the nearest tank. The passing of pilgrims through the Cuttack town in their way to Poori was, it is stated, stopped this year, by providing for them a road at a distance of two miles from the limits of the town. The reduction of the death-rate from cholera in this town from 4·55 per 1,000 of population in 1882 to 1·41 per 1,000 during the year under review is attributed to this measure.

	Ratio per mille.		Ratio per mille.
Aul thanah ...	6·00	Jaipur town ...	3·47
Patamundi „ ...	4·53	Tirtol thanah ...	2·32
Kendrapara „ ...	3·54	Salipore „ ...	1·94

73. The *Poori* district also suffered at a considerably lower rate this year. The total casualties amounted to 1,122, or at 1·26 per 1,000 of the population against 3,783, or 4·25 per 1,000. The percentage of villages affected by the disease was 6 against 13. Only the Poori town, forming the centre of the pilgrim gathering, which generally heads the list of localities of high suffering, returned a noticeably high death-rate, viz., 6·95 per 1,000 of population. The behaviour of cholera in 1883 was much the same as in former years, viz., that it exhibited greater activity and fatality at three different periods of the year more or less coincident with the three great religious festivals held in the town of Poori than during the intervening periods.

74. *Balasore.*—Here also the prevalence and fatality of the disease had diminished to a very great extent as compared with its incidence in 1882, but the mortality was higher than in the two other districts in Orissa. The percentage of villages pervaded by the disease was 12 against 25 and 2,007 persons, or at 2·12 per 1,000 were carried off by it against 5,877, or at 6·21 per 1,000. In seasonal fatality January to July and December exhibited greater suffering than the rest of the months, and the areas mentioned in the margin furnished the highest death-rates. No information possessing any special interest was found in the sanitary reports submitted, except that the Magistrate says that, cholera broke out among the coolies working on the Coast canal, resulting in 20 casualties.

CHOTA NAGPORE.

Cholera in the Chota Nagpore division of the Province.

75. This division of the Province enjoyed, as it also did in the preceding year, great immunity from the disease. The casualties numbered 1,605, yielding a death-rate of only ·37 per 1,000 of its population enumerated at 4,334,178. The mortality in the preceding year was the same, viz., 1,642 deaths, or at ·37 per 1,000. The death-rates were low during every month of the year, excepting July and August, which exhibited a small exacerbation.

76. *Hazaribagh.*—Cholera prevailed in this district more fatally than in any year since 1879, but the general death-rate in the year under review was insignificant. 1·27 per cent. of the villages were visited by it against 13 per cent. in 1882, and 723 deaths, or at ·65 per 1,000 of population were recorded against 153, or ·13 per 1,000. The months of greatest suffering were June to August. The disease followed its usual course. It appeared in the hot weather in April in the lower levels of the district, and although isolated cases also occurred in the higher levels during this period, it did not

assume serious proportions until the rains commenced in the middle of July. It prevailed epidemically in only the Hazaribagh town, where 3·20 per 1,000 of the population was carried off. Of noticeable local outbreaks, the following are cited by the Civil Surgeon, Dr. Cobb, the facts connected with which came under his personal observation. At an outbreak in the Hazaribagh town the disease was located in a street in the bazar at the end of which was a large tank. The first case occurred in a man who had come from Bagodar on the Grand Trunk road, and who died in this street the day following his arrival after he had washed himself in this tank. A few days after this other cases occurred, but after the Police had been placed around the tank no other cases occurred for three weeks. In another severe outbreak of the disease in another part of the town the burning of sulphur fires in the affected locality, as recommended by Dr. Tuson, appeared to have had some effect in checking the disease, as it was followed by a marked diminution in the number of cases reported.

77. In the *Lohardugga* district there was also an accession of the disease, the deaths numbering 536 against 109 in 1882, and the death-rate amounting to ·33 per 1,000 of population against ·06 per 1,000. It prevailed extensively in the rainy season during the months of July to August, and was confined to the Palamow sub-division, where only the Hosseinabad thanah suffered severely, presenting a death-rate of 4·19 per 1,000 of population. In no other circle in the district was the death-rate noticeably high. The cholera in Hosseinabad, as well as in Garwah, is believed by the Deputy Commissioner to have been imported from Gya, where it was prevailing to a considerable extent.

78. *Singbhum* and *Manbhum*.—In these districts cholera prevailed at a low rate, and as compared with its incidence in 1882, with lesser severity. The marginal figures indicate the sickness and mortality that were presented by them. While the disease was not severe in any month in Singbhum, it exhibited a small exacerbation in April in Manbhum. No area in either of these districts suffered with exceptional severity. In *Manbhum* the only noticeable outbreak of the disease was that which occurred among a party of jattrawallahs (actors) *en route* to Bankura. One of their number died in the dispensary at Purulia, but the rest escaped the disease. Two cases of cholera also occurred in the cooly depôts.

Manbhum ...	312	1,315	·29	1·24	81	291

79. **Port of Calcutta.**—In the Port of Calcutta 37 deaths occurred among the *European seamen* out of 65 admissions into hospital, being in the proportion of 19·89 per 1,000 of population of the year as estimated by the Health Officer. In addition there was one death out of hospital. This mortality was lower than that which occurred in 1882 and 1881, but double that of 1880, as the death-rates in these years amounted to 22·87, 24·44, and 10 per 1,000 of population, respectively. Of the 65 who were attacked by the disease, 38 were ascertained to be new arrivals in Port of less than a month, and of the 37 casualties, 23 were found to have occurred in persons who had been indulging in drink on shore. In seasonal fatality the unhealthiest months in Port were precisely the same as in the town, viz., March, April and May; for while out of 1,911 deaths in town 1,036, occurred in these months, 19 out of the 38 casualties in Port took place in the same months.

Cholera among European Seamen.

80. Cholera was the chief cause of death among the *native floating population* in this as in the preceding year, and the mortality in both years was nearly identical, the deaths amounting to 116, or at 4·56 per 1,000 of population in 1883, as opposed to 115, or at 4·52 per 1,000 in 1882.

Cholera among the Native Floating Population

81. The Health Officer submits the subjoined figures as illustrating the lesser liability to cholera of the native river population drinking unfiltered water as compared with that of the town population using filtered water. The town figures have been taken from the reports of the Health Officer of the town, and from the Port

Comparative influence of filtered and unfiltered water on cholera.

figures the deaths and average strength of the European seamen, who drink filtered water, have been deducted:—

	Ratio per *mille*. 1883.	1882.	1881.
Town	4·7	5·2	3·9
Port	4·40	4·35	2·60

82. I hope I may be pardoned for entering into so much detail of cholera prevalence in the Province, but it is important that a concise record of the disease, district by district, should be annually prepared for ready reference by the Government and Sanitary and Medical officers. The several divisions also differ so widely in climatic and physical features, that observations on them must be given separately to be of any value.

Why the Cholera history of the year should be furnished in some detail.

SMALL-POX.

83. The recorded deaths from small-pox amounted, during the year under review, to 9,714, or at the rate of ·14 per 1,000 of population; and it is gratifying to observe from the marginal table that this mortality was lower than that of any year of the preceding decade, excepting 1875 and 1877. The incidence of the disease was marked during the year under notice with more or less severity in 30 circles against 33 in 1882, and it was absent from 284 against 280, and affected 1·73 per cent. of the villages against 2·33 per cent. The contributions to the mortality of the year by the urban and rural circles are marginally indicated.

Goas, in Murshidabad... ...	1·23		

85. It is again seen, *vide* marginal figures, that small pox was specially prevalent during the hot months of March to June, as 55 per cent. of the total mortality in 1883 and 57 per cent. in the quinquennium 1878-82 occurred in these months.

86. The figures given in the margin, illustrating the mortality among infants and children, again indicate that the largest number of casualties from small-pox occurred among them, as no less than 71·04 per cent. of the total mortality from the disease was contributed by them. In comparison with 1882 a much higher percentage of infants and children perished from this cause during the year under review. The death-rate among male children was, as usual, in excess of that among females.

Chief particulars relative to the prevalence of Small-pox in particular districts.

87. The information under this head is subjoined.

88. In *Burdwan*, the largest number of casualties from small-pox, 74, out of 108 the total mortality, was reported from thanah Ketugram, notwithstanding that the whole of this district was in the previous year pronounced by the Superintendent of Vaccination, Metropolitan Circles, to have been thoroughly protected. The *Midnapore* district was remarkably free from the disease this year, and the mortality was lower than during several past years. Sabang returned the largest number of deaths, but this thanah is one of those in which the people are opposed to vaccination. The great freedom from the disease of the *Khulna* district is attributed to thoroughness of protection by past vaccination. In *Murshidabad* there was a large increase in the prevalence of the disease, the deaths numbering 335 against 94 in 1882, and a good many of the casualties occurred in those who had been attacked towards the close of 1882. This district has also the reputation of having been thoroughly protected. 628 persons, 137 fatally, were attacked by small-pox in certain villages in thanah Goas. These villages are chiefly inhabited by Ferazees, who stoutly resist vaccination on religious grounds. Thanah Jelinghi also suffered severely, the deaths numbering 101. In *Darjiling* small-pox appears to have been confined in the hill portion, the Terai and the plains being almost free from it. In this district, which is wedged in between Nepaul, Sikkhim and Bhootan where the population is unprotected, and where inoculation is resorted to for protection, the disease is frequently traced to importation by travellers, traders, coolies, and others from beyond the frontier. *Bogra* was the only district in the Province which enjoyed complete immunity from the disease; in *Rungpore* only one death was recorded, and in *Jessore* and *Dinagepore* three each. At *Noakholli* the disease is an annual visitant, and is believed to be due to inoculation which is generally practised. It prevailed to an unusual extent in Sundip during January to April. Vaccinators from the Eastern Bengal Vaccination Circle were deputed to stamp out the disease. Dr. O'Brien, the Civil Surgeon of *Shahabad*, states that small-pox is propagated in his district every year by inoculators. At the time of writing his report, a child was brought to him covered with confluent small-pox after inoculation. He thinks that the inoculators to whom licenses to practise vaccination are issued by him every year, being without supervision, use the licenses as covers to carry on their original practice of inoculation. This will always be the case so long as ex-inoculators are allowed to carry on operations unsupervised. A very smart outbreak of the disease occurred in the *Durbhanga* Municipality, and the necessary steps were adopted to stamp it out. It prevailed with the greatest severity in May and June, resulting in 42 deaths, or at ·63 per 1,000 of population. *Chumparun.*—The disease prevailed in a serious epidemic form almost throughout this district from May to September, the Motihari sub-division suffering to a greater extent than Bettiah the other sub-division. On the whole 2,308 persons were reported to have been attacked, of whom 657 (according to the mortuary returns) died, being in the proportion of ·38 per 1,000 of population. The local reports, which are presumably more correct, give 868 deaths. *Monghyr*, *Bhagulpore* and *Sonthal Pergunnahs.*—The disease was very widespread in these districts, but the mortality does not, according to the returns, appear to have been great, the deaths recorded amounting to 266, 197, and 80 respectively. The casualties in Monghyr, of which the mortuary statistics are very imperfect,

and in Bhagulpore, were considerably smaller than in 1882, but in the Sonthal Pergunnahs they were somewhat larger. Almost the whole of the Sonthal Pergunnahs and Bhagulpore districts are reported to have been thoroughly vaccinated. The sanitary reports from Monghyr and Bhagulpore contain no account of the outbreaks which occurred in them, but the Superintendent of Vaccination, Sonthal Pergunnahs Circle, notes that at Bhagulpore some children were found to have been inoculated, that at Serainpore in this district the people refused vaccination, and that it was found difficult to vaccinate Banka and Amarpur, as the affected villages in them are far apart from each other, and the people much opposed to vaccination. In the Sonthal Pergunnahs district there occurred several local outbreaks confined to limited areas, the chief of them being the following:—In June a sharp outbreak occurred in the Shariahat Bazar, 20 miles north-west of the Dumka town, where 20 were attacked and 3 died. In the town of Deoghur the disease prevailed with very great severity, continued throughout the year, and passed on to the current year. It first broke out in February in the person of a man who resided in a village near the town and had brought the disease from Patna. From this locality it spread gradually to the bazar and other parts of the town. Every effort was made to vaccinate the unprotected, and, although the natives of the place submitted to the operation, these endeavours were rendered abortive owing to some up-country families having strongly opposed and steadily refused the prophylactic. The Compulsory Vaccination Act has since been introduced into this town. In Jogia and some adjoining villages, 8 miles north-east of Deoghur, 67 cases attended with 27 deaths occurred in March. Another sharp outbreak occurred in the same month in Maharawa and some neighbouring villages 12 miles south of the outpost of Motaganiah in the sub-division of Godda affecting 89 persons and causing 19 deaths. There was an outbreak in April chiefly confined to the villages near Sahebgunge in the sub-division of Godda, where 74 cases occurred attended with only six deaths. This outbreak was traced to importation from Deoghur where the disease was prevailing, having been brought by a villager on his return from a visit to the shrine of Badyanath. An outbreak at Rakti near Sarwan in Deoghur was originated by a lad who had been inoculated 10 years ago. The disease is still (June 1884) prevailing in the abovementioned three districts with marked severity, and the whole of the permanent vaccination establishment of the circle is engaged in suppressing it. Although there was, on the whole, a reduction in the prevalence and fatality of small-pox in the *Poori* district, it prevailed severely, to a more or less extent, in thanah Bhanpur during the whole year, as it did in 1882, July and August being the worst months. It first appeared in the village of Ranipara, and spread gradually to the whole thanah. It was not confined to any particular locality, isolated cases occurring everywhere. Active steps were taken to stamp out the disease by vaccination. It is noticeable that the town of Poori enjoyed entire immunity from the disease. In *Hazaribagh*, the disease prevailed with greater severity than in the preceding year, the mean death-rate being ·15 per 1,000 against ·10 per 1,000. A virulent and very fatal outbreak occurred in Bishengarh. It appears to have commenced in March 1882 and to have lasted up to June 1883, but no information of its existence was sent to the Vaccination Department until February 1883. There was some delay in sending a vaccinator to the locality, as the one who was directed to proceed to it did not obey the order. Another vaccinator was, however, sent in May, but he could not carry on his work for a time owing to opposition by the higher classes whose example was followed by the lower. On this being reported to the Superintendent of Vaccination, he proceeded to the locality, and with great difficulty vaccinated 55 of the children. After this the opposition broke down in a great measure, but 20 of the children could not be operated on, as no explanations, persuasions, &c., could induce their parents to bring them out of their houses for the purpose. In *Singbhum* the disease prevailed very fatally, the reported number of cases being 278 and the deaths 212, as opposed to 192 cases and 166 deaths in the preceding year. In the town of Chyebassa it prevailed epidemically. It broke out in May of 1882 and passed on to the year under review. But the mortality from the disease, which was highest in January, ceased in March. In *Manbhum* the disease prevailed epidemically only

in the Topchanchi thanah during the latter half of the year. There occurred 125 cases attended with 18 casualties. It was traced to pilgrims *en route* to Poori.

89. *Port of Calcutta.*—In the Port of Calcutta small-pox, while it was absent from among the European seamen during the two preceding years, attacked five of their number during the year under review, but not fatally. Of the native floating population nine, as far as could be ascertained, had the disease, and two died, against 7 attacks and no deaths in 1882. On a steamer which arrived in Port with return pilgrims from Jeddah, there were found three cases of small-pox among its 584 passengers. The sick were sent to hospital, and the vessel detained at Garden Reach until she was cleaned and disinfected.

FEVER.

90. Fever, which causes a far higher mortality in the Province than any other disease, prevailed with diminished severity during the year under review as compared with its immediate predecessor and also with 1881, but with markedly enhanced fatality in comparison with its incidence during all the years since 1871 for which records of any reliability are available. The number of deaths amounted to 913,766 and the death-rate to 13·81 per 1,000 of the population under registration, as opposed to 929,943 deaths, or at 14·06 per 1,000, in 1882, thus showing a reduction in deaths of 16,177 and in the casualty-rate to population of ·25 per 1,000. The disease pervaded 57 per cent. of the villages in the Province, against 51 per cent. in 1882, and exhibited great virulence in 27 circles against 58; less activity in 130 against 109; and low prevalence in 491 against 477. Of the 45 districts, 19 returned enhanced mortality against 22 in the preceding year.

Comparative mortality from Fever in the Urban and Rural circles.

91. To the total mortality of the year the urban circles contributed 34,025 deaths, or in the proportion of 13·77 per 1,000 of population, and the rural circles 879,741 deaths, or at 13·81 per 1,000. The returns of the preceding year furnishing corresponding information exhibit for the urban circles 38,792 deaths, or at 15·72 per 1,000, and for the rural circles 891,151 deaths, or at 14 per 1,000. The comparison shows a diminution in mortality in both the urban and rural circles, particularly in the former. It is noticeable, moreover, that in 1883 the death-rate in the rural circles was somewhat greater than in the urban circles. Considering that the former are better registered, it appears that fever was more fatal in the rural than in the urban circles.

92. The seasonal incidence of fever, as illustrated by the figures given in the margin, again confirms the observations made year by year, viz., that the disease exhibits progressive severity after the rains have well set in, and is most fatal during the period January, October, November and December, especially during the two latter months, when the sodden soil is rapidly drying, and there is a great daily range of temperature.

Seasonal incidence of Fever.

Months.	Deaths in 1883.	Rainfall in 1883.	Average deaths in 1878-82.
December	113,449	1·36	94,449
November	108,835	·12	93,156
October	85,673	·99	75,808
January	83,949	·69	71,597
September	77,233	6 72	62,216
August	70,597	12·04	59,349
April	68,439	2·40	58,574
February	65.425	·46	55.921
March	64,785	1 51	58,049
July	61,552	14·30	52,521
May	59,243	4·65	53,906
June	54,541	13 60	49,575

93. The marginal table indicates that again the highest suffering from fever was limited, with six exceptions, to the districts in the Burdwan, Presidency and Rajshahye divisions, Rajshahye heading the list instead of Nuddea which had held this position since 1880. It is gratifying, however, to find that the fatality of the disease had diminished in all these districts, excepting Rajshahye, Jessore and Pubna, and especially in Nuddea where the mortality appears to have come down to normal proportion.

Districts in which Fever prevailed most severely.

Districts.	Ratio per *mille*. In 1883.	Ratio per *mille*. In 1882.

f

94. The information under this head is almost identical with that submitted in the Reports of former years, and need not therefore be recapitulated.

Causes of Fever and measures adopted to arrest it.

History of the incidence of Fever in the districts.

95. The leading and noteworthy information relating to the incidence of fever in each district is subjoined.

BENGAL.

Fever in the Bengal division of the Province.

96. In Bengal fever prevailed, as usual, with considerably greater severity than in the other three divisions of the Province, Behar, Orissa and Chota Nagpore. Its incidence, as compared with the preceding year, exhibited very little variation, for while in 1883 the casualties numbered 576,474, and the death-rate amounted to 16·43 per 1,000 among a population numbering 35,073,770, 1882 returned 584,704 deaths, or at the rate of 16·67 per 1,000. The most unhealthy months were January and September to December.

97. *Burdwan.*—Although third on the list of severely fever-stricken districts, the prevalence and severity of the disease in Burdwan had diminished sensibly during the year under review in comparison with the preceding year. 88 against 92 per cent of its villages was pervaded by the disease; the recorded deaths amounted to 32,502 against 40,173, and the death-rate to 23·35 against 28·86 per 1,000 of population. January to April and November and December were the most unhealthy months, and the rainy months the most healthy; and the suffering was greatest in the areas marginally indicated. No information referring to local outbreaks of, or other particulars relating to, the disease has been furnished by the Civil Surgeon; but he believes that at least 50 per cent. of the deaths returned under the head of fever is due to other totally different diseases, particularly inflammatory chest affections. The statistics under this head are, consequently, misleading when used as a test for gauging the malarious character or otherwise of the district. He is also of opinion that the fever of past years known as the "Burdwan fever" has disappeared to a large extent from Burdwan, and has invaded the adjoining districts of Nuddea and Birbhum.

Ausgram " ...	28 54	Purbasthali " ...	25·39
Burdwan town ...	27 84	Bud-Bud " ...	25·22
Kalna thanah ...	26 90		

98. *Bankura.*—In this district, the deaths numbered 17,418, or at 16·71 per 1,000 of population, against 27,508 or at 26·40 per 1,000, showing a decrease in deaths of 10,090 and in the proportion in relation to population of 9·69 per 1,000; but the population of villages affected by the disease was in excess by 13 per cent. The months in which the highest mortality occurred were January and August to December, and the circles named in the margin suffered the most, of which all the villages in Sonamukhi were affected. With reference to these circles, which are situated in the east of the district, the Civil Surgeon, Dr. Ghose, says that, their climate and soil are similar to those of Burdwan, and that they suffered the most throughout the year, except in June and July; while, on the other hand, the thanahs which compose the laterite tract were invaded by the disease, in its severe form, for only a month or two after the cessation of the rains, and these facts, he submits, indicate clearly that ground moisture is one of the conditions under which the disease prevails. His experience in Rungpore, he asserts, was confirmed on his visiting the thanahs of Bissenpur and Anda, viz., that localities where the drainage is defective, or which adjoin a marsh, suffer from fever in its endemic form, while well-drained places suffer during the rains, and enjoy immunity directly the cold weather sets in. He instances two villages, Anda and Ajoodhya, not far from each other, the former having a marsh behind it, and the latter situated on the banks of the Dalkisser river which carries away the rain water from the village. In Anda the people were suffering severely in January and deaths were frequent, while in Ajoodhya the people were healthier, but said that fever prevailed among them in August, September and October. On examination a strikingly larger percentage of people with enlarged spleen and malarial cachexia were seen at Anda than at

Bissenpur thanah ...	24·30	Sonamukhi town ...	20·84
Kotalpore " ...	22·79	Indus thanah ...	19·75

Ajoodhya. Again, the Bissenpur town, which has a marsh on the west and south of it, presents a sad spectacle of disease and death. He is, therefore, of opinion that soil moisture is not *per se* the cause of fever, but that "so long as the contagion, whatever it might be, was not introduced either by human agency or from village to village by the wind, the humidity of the soil did no harm, but the contagion once falling on congenial ground multiplied in abundance in proportion to the soil moisture, and caused the disease. Where the moisture in the soil, owing to the proximity of a marsh, is perennially damp, there the fever prevails the most."

99. In the *Birbhum* district the percentage of villages attacked by the disease was 80 against 77 in the preceding year, and the deaths numbered 17,698, or at 22·27 per 1,000 of population against 21,945 or at 27·62 per 1,000, indicating a diminution of mortality. The months in which the disease prevailed most were January and August to December, and the marginally noted areas returned the highest mortality, thus showing that the disease in its severe form was present in every thanah of the district except Monreswur. It was observed that in the town of Soori there was, on the whole, less fever than in former years; that most of the fatal cases occurred in chronic sufferers; that the number of those who suffered from the disease in its acute stage were few; that when death overtook even these, it was after complications, such as pneumonia, coma, or convulsions, had set in; and that the fever was general among the European community, scarcely any member of a family escaping it. The Civil Surgeon Dr. Roy's opinion as to the causation of fever coincides with that of Dr. Ghose of Bankura, for he says that to the dryness of the soil the lesser prevalence of fever may be ascribed, while, on the other hand, prolonged dampness and moisture bring about the opposite condition.

100. In the *Midnapore* district 38,570 deaths were recorded in 65 per cent. of the villages, against 39,626 in 69 per cent. in 1882, the proportion of deaths to population being 15·31 against 15·73 per 1,000. These figures do not represent a greatly reduced mortality. November and December were the worst months, and the suffering was greatest in the circles named in the margin. Naraingbar, which has of late years returned a heavy mortality, again heads the list; but the death-rate was lower than in 1882 by so much as 6·36 per 1,000 of population. Dr. Tomes, the Civil Surgeon, remarks that, his anticipation (expressed in his Report for 1881) that the prevalent epidemic fever would extend over the south of the alluvial and littoral portion of the district has been realized, for the thanahs which are situated in this area have all returned a heavier mortality in comparison with 1882, while, on the other hand, the north-east of the district, which was first invaded, suffered to a less extent than in 1882. An examination of the mortuary figures confirms these observations.

101. *Hughli.*—The sickness and mortality in this district had also diminished. Seventy-eight per cent. of the villages were affected against 99 in 1882, and the deaths amounted to 14,526 or at 14·34 per 1,000 of population, against 17,305 or at 17·08 per 1,000. To this mortality Serampore contributed 3,668 casualties or at 10·42 per 1,000 of its population, as opposed to 4,328 deaths or at 12·29 per 1,000. November and December were the worst months, and in only the Hughli, Polba, Balagarh and Pandua thanahs the mortality was noticeably high, the death-rates furnished by them being 32·28, 22·17, 21·61, and 19·58 per 1,000 of population respectively. The Sanitary Reports of this district do not contain any noteworthy information, except that it has been noticed for many years that in the sub-division of Serampore a definite relation exists between the quantity of rainfall and fever and fever mortality, that is a large rainfall is followed by increased sickness. The rains ceased prematurely in September 1882, and there was an early and unusually severe cold weather. The result was that malarious fevers were kept down.

102. In *Howrah* the prevalence and fatality of fever had increased to a small extent, but this increment was not confined to any particular circle, for none of the circles exhibited a noticeably high death-rate. The recorded deaths amounted to 5,353 in 64 per cent. of the villages, and the casualty-rate to 8·42 per 1,000 of population, the corresponding figures of the preceding year being deaths 4,634 in 62 per cent. of the villages and death-rate 7·29 per 1,000.

103. *24-Pergunnahs.*—Although, in comparison with 1882, the disease prevailed more extensively in this district, the mortality was to some extent lower, for 87 against 79 per cent. of the villages was pervaded by it, and the deaths numbered 27,499 against 29,238, and the death-rate amounted to 14·70 against 15·07 per 1,000 of population. In seasonal fatality January, November and December took the lead, and in the areas named in the margin the mortality was conspicuously great. Every village in the Deganga thanah was affected by the disease. The Sanitary Reports from this district contain no special information that need be recorded.

104. *Nuddea* occupies the second place in the list of districts which suffered most from fever in 1883, but it is very gratifying to find from the subjoined table* that, although the severity of the disease is yet great in several places, a progressive improvement has occurred, on the whole, since it visited the district with unprecedented severity in 1880, inasmuch as the death-rate has decreased from 35·54 per 1,000 of population in 1881 when the disease exhibited maximum epidemic virulence, to 27·60 per 1,000 in the year under review:—

* As the Bongong sub-division was transferred from this district to Jessore in 1883, its statistics have been omitted from this table for all the four years, in order that the comparison of results may be fairly considered.

This table discloses, moreover, that the suffering was greatest in the Sudder and least in the Kushtia sub-division, as compared with the rest of the sub-divisions, throughout the four years the statistics of which are embraced in it; that while the Meherpore sub-division suffered in a secondary degree in 1880 and 1881, the Chuadanga sub-division assumed this position during the two following years; and that individually considered the under-mentioned areas continue to present very high death-rates:—

	Ratio per *mille.*		Ratio per *mille.*
Kaligunge thanah	39·06	Meherpore town	31·05
Hanskhalli "	37·38	Kishengunge thanah	30·70

Chuadanga "	32·95	Tehatta thanah	29·59
Jabunnagore "	31·45	Jaguli "	29·18
Santipore "	31·14	Naupara "	29·15

It is noticeable, however, that the Kushtia sub-division exhibited greater mortality in 1883 than during the preceding three years, the death-rate having risen from 19·32 per 1,000 of population in 1880 to 25·79 per 1,000.

The nature, seasonal fatality, and causation of the fever in this district have been fully dwelt upon in former Reports. The incidence of the disease during the year under review presents no new feature, except that the deficient rainfall of the year may have had a share in reducing its intensity. All the medical assistance that was needed was supplied by the Government.

105. *Jessore.*—This district is the fourth on the list of severely fever-stricken districts in 1883. The disease prevailed in it much more extensively and fatally than in the preceding year, as indicated by the following figures:—Percentage of villages affected by the disease 83 against 71; deaths 44,882 against 34,090; and proportion of deaths per 1,000 of population 23·14 against 22·93. Its severity was felt most during the months of January and October to December, and the 16 circles named in the margin out of the 22 in the district furnished conspicuously high death-rates. The prevalent fever was of the ordinary intermittent type, generally accompanied by enlargement of the spleen and anœmia.

The Civil Surgeon again refers it to the obstruction of the natural drainage of the country for the purpose of growing paddy, but the Magistrate doubts this statement. No further account has been furnished regarding the exceptionally severe prevalence of the disease; but it will be noticed that among the thanahs of severest suffering given in the margin are the five thanahs of Sarsha, Ganapota, Bongong, Mohespore and Gaighatta in the Bongong sub-division transferred from Nuddea to this district, which have been the scene of severe prevalence of the disease since 1880.

106. The prevalence and fatality of the disease had subsided to a great extent in *Khulna.* The percentage of villages embraced by it was 79 against

86; the recorded deaths numbered 18,941 against 20,144; and the death-rate amounted to 17·53 against 18·65 per 1,000 of population. In only the Magura, Bagirhat and Baitaghata thanahs the suffering was prominently high, the death-rates presented by them being 20·76, 20·25, and 19·97 per 1,000 of population respectively. The villages of Chanduria, Kadpur, Goalpara, Chondunpur and Gayrah in the municipality of Chanduria also suffered severely.

107. *Murshidabad.*—Twenty-six thousand seven hundred and thirty-four deaths, or at the rate of 21·79 per 1,000 of population, were recorded in this district in 92 per cent. of the villages, as opposed to 31,921 deaths, or at 26·01 per 1,000, in 94 per cent. of the villages in 1882. The 19 marginally noted circles out of a total of 27 into which the district is divided, returned conspicuously high death-rates. Of these circles the whole of the villages in thanahs Shahanagar, Bhagwangola, Dewanserai, Gorabazar, Hariharpara, Daulatbazar were pervaded by the disease. These statistics denote that, although the disease was still very diffused, its prevalence and fatality had abated, the latter notably. It did not assume anywhere an epidemic character as in the two preceding years; in fact, it is, as reported before, endemic to the district referable to its physical formation. It was present pretty evenly throughout the year, but was, as usual, severest during the four months following the cessation of the rains, September to December. There was considerably less rainfall during the year, viz., 42·19 inches against 52·79 inches in 1882 and 56·29 inches, the average of the preceding 10 years. Past experience justifies the Civil Surgeon in stating that there is usually with an excess of rainfall an increase of fever.

108. In the *Dinagepore* district, although the disease was considerably more widespread, it was much less fatal than in 1882. Eighty per cent. of the villages were affected against 70 per cent., and the deaths amounted to 26,014 or at 17·17 per 1,000 of population, against 23,648, or at 15·61 per 1,000. The areas indicated in the margin were those in which the suffering was greatest. The severity of fever is said to bear in this district apparently, some relation to climatic changes. In the early months fresh cases of the disease are rare, the sufferers being those who had been severely attacked during the rains of the preceding year, and whose vitality had been lowered. About October, the action of the cold is very prejudicial, so that chronic cases who are unable to stand any further strain on an already lowered vitality and shattered nervous system succumb in large numbers in November and December. The effect of the drainage scheme on the health of the town of Dinagepore commenced in 1879 on the recommendation of a Committee appointed to enquire into the causes of the great unhealthiness of the place, and completed in 1881, may be judged by the figures given in the margin. I am not at present prepared to say that the scheme has fulfilled the hopes of its originators. Some further improvements are, however, contemplated, which may be followed by more decisive results.

109. *Rajshahye.*—This district occupies the first place on the list of districts which suffered most severely from fever. Ninety-one per cent. of its villages, against 90 in 1882, was ravaged by the disease, and it recorded 40,331 deaths, or at the rate of 30·12 per 1,000 of its population, against 32,450 deaths, or at 24·24 per 1,000, indicating that both the sickness and mortality had increased, the latter

very considerably. The disease prevailed with marked severity during every month of the year, excepting May and June. All the circles, excepting the Beauleah and Nattore towns, returned conspicuously high death-rates, *vide* table in the margin; and every village in all these circles, excepting Manda, Singra and Godagari, was pervaded by the disease.

Dr. Bensley, the Civil Surgeon, has recorded the opinion in his Reports for several past years, that the health of this district has been gradually deteriorating. Fevers, chiefly of the intermittent type, recurring frequently, and complicated with enlargement of the spleen and liver, anæmia and malarial cachexia, have been prevailing widely and with great fatality throughout the district. Thanahs Tanor, Beauleah and Putia, notably the Doorgapore outpost situated in the last named thanah, have been suffering persistently for the past six years, *vide* table given in the margin.

„ 1883 ...	29·59	29·76	41·09

The chief cause of the suffering is attributed to a deficient and vitiated water-supply, and how this was brought about has been described in the Report for 1882. This year, owing to a deficient rainfall and absence of floods, the evil has been intensified everywhere, excepting in the southern parts of the district which lie on the banks of the river Ganges. This opinion is endorsed by the Magistrate, who adds that many good tanks of former years have been neglected, so that now most of the village tanks contain decomposed water. It is believed that the Road Cess Committee have in view a project for clearing out the waterways that used to feed the Haja nuddi, but this, the Civil Surgeon notes, will benefit only a portion of the country. The radical remedy is good tanks and wells, but these the people do not supply owing to their ignorance of the benefits of good water and pretended poverty; nor will the zemindars render assistance in this matter, although the cost of a good well is only 5 rupees, as they are fatalists and look upon the occurrence of sickness as calamities that human agency cannot control. Dr. Bensley suggests that, as at present the scarcity of water in the district is so serious as to threaten a wide-spread and severe prevalence of fever among the people, the executive officers of the district should take up the question, and stimulate the people to self-help, either by persuasion or, what is better, by providing the want at their (the people's) expense. The present state of the law will, however, not admit of the latter suggestion being given effect to. It is gratifying to record that the towns of Beauleah and Nattore have not only suffered less from fever, but that their general health has improved. This is referred to the sanitary improvements that have recently been carried out in them, chiefly with regard to water-supply, by the introduction of river water into the reserved tanks, clearing out old tanks, &c.

110. In the *Rungpore* district, fever prevailed much more extensively and fatally than in the preceding year, as will be seen from the following figures. The percentage of villages affected amounted to 55 against 45, and the mortality was represented by 32,897 deaths, or in the proportion of 15·68 per 1,000 of population, as opposed to 24,123 deaths, or at 11·49 per 1,000. November and December were the worst months, particularly the latter, and the areas of greatest suffering were those named in the margin.

	Ratio per *mille*.		Ratio per *mille*.
Mithapukhr thanah...	24·67	Ulipore thanah ...	19·45
Maigunge „ ...	23·26	Rungpore town ...	19·06
Nageshwari „ ...	21·15		

In common with the district, the Rungpore town suffered somewhat more severely than during the preceding year. The Magistrate very graphically describes the effects of the disease prevalent in it. He says, that nearly every morning on arrival in kutcherry he found a little pile of letters from the amlah asking to be excused attendance on account of fever; that many had to go away to their homes more or less invalided; that he himself, who had never been ill for 20 years, had an attack; that up-country men suffered particularly, being

unable to shake off the disease like natives of the district; that nearly all who were in the service of the Europeans had been laid up, and that of their number some died, others were dying, and the rest had to go away to their homes in a drier climate. The unusual rainfall in April and May lowered the temperature to a point which, although pleasant to the Europeans, did not agree with the natives, and the deficient fall in September with a total absence of rain during all October and November brought in early an unusually cold weather, which could not be withstood by a people who are feeble in constitution and poor in physique. But, notwithstanding the ravages of the fever in the Rungpore town, as above described, the figures in the margin conclusively indicate that the drainage scheme commenced in 1878 and completed in 1882, which had for its object the improvement of the health of the town, has done its work, for a comparison of the mortality from fever and all cause combined from 1878 when the drainage scheme was inaugurated, with the mortality during the quinquennium 1873 to 1877, the period anterior to the commencement of the scheme, shows that synchronously with the advancement of the project a marked improvement was observed in the health of the town, due allowance being made for improvement in registration. The scheme, however, is only a partial one and does not drain many extensive swamps to the east of the town which undoubtedly exercise a prejudicial effect on its health.

1880	18·15	25·54
1881	19·21	26·50
1882	18·39	23·64
1883	19·06	29·57

111. In the *Bogra* district there was a marked decline in the prevalence of the disease with a small reduction in mortality, as the percentage of villages attacked was 62 against 69, the deaths numbered 14,184 against 14,487, and the death-rate amounted to 19·31 against 19·72. As usual, the fever was noticeably and steadily severe during the rains and in the concluding quarter of the year, particularly during the latter period when the sufferers had been enfeebled by repeated attacks of the disease, and the weather was cold. The circles marginally noted returned the highest death-rates. In thanahs Panchbibi, Khetlal and Badalgachi, situated respectively in the north, west and extreme west of the district, rank vegetation and dense jungle abound, and the drainage is defective; and it has been noticed that thanahs Sherpur, Shibgungo and Panchbibi have been suffering severely from the disease for the past seven years.

	Ratio per *mille*.		Ratio per *mille*.

112. *Pubna.*—In this district the incidence of the disease was much more severe than in the preceding year. The percentage of villages covered by it was 69 against 61, and the casualties amounted to 29,134, or in the proportion per 1,000 of population of 22·43 against 23,575 deaths, or at 17·97 per 1,000. The months of greatest suffering were January and October to December, and in the localities indicated in the margin the greatest mortality occurred. It was observed that "a scanty rainfall was attended with great increase of fever," and that "the reduction of temperature had, by inducing severe complications in fever cases during the cold season, given rise to high mortality." Of local outbreaks of the disease, the Civil Surgeon quotes one which occurred in certain parts of the Serajgunge town. Here he says, the fever was of the remittent type and prevailed in April with great virulence and speedy fatality; the villages attacked are situated on low, undrained, swampy land, surrounded by dense clumps of bamboos preventing perflation and sunlight, and honey-combed with filthy excavations which receive night-soil, cowdung, kitchen-refuse and house drainage; and uncovered municipal trenches exist in close proximity to the town. He adds that this year the inundations did not, as they usually do, scour out these excavations, as the culvert or sluice through which the Katti khal water flows into the village was shut up by the municipality.

Dulai „ ...	30·67	Pubna town ...	22·99
Pubna „ ...	30·45	Mathura thanah ...	22·76

113. In *Darjiling* the disease proved somewhat more fatal than in the preceding year. Nine hundred and nineteen deaths, or in the proportion of 5·88 per 1,000 of population, were reported from 32 per cent. of the villages, as opposed to 763 deaths or at 4·91 per 1,000. May, June and July were the most unhealthy months, and in the Darjiling town (8·77 per 1,000) and Kalimpong rural circle (8·12 per 1,000) the severest mortality occurred. The Sanitary Reports do not contain information possessing any special interest for reproduction here.

114. *Julpaiguri.*—The prevalence and fatality of fever in this district had declined to a small extent in comparison with its incidence in 1882, as the records indicate that 7,796 deaths, or at 13 40 per 1,000 of population, occurred in 40 per cent. of the villages, against 8,138 deaths, or at 13·99 per 1,000 in 43 per cent. of the villages. January and October to November were months of severest suffering, and only the Salbari rural circle presented a conspicuously high death-rate, 22·07 per 1,000 of population. Referring to the nature of the fever prevalent in this district, the Civil Surgeon observes:—"Repeated attacks of ague produce enlarged spleen and liver, intense anæmia, spongy gums, ascitis, and anasarca, and when in such condition diarrhœa or the asthenic form of dysentery supervenes, death very quickly results." It is stated that the Duars, which are very unhealthy for both Europeans and natives, are being gradually converted from an impenetrable jungle into tea gardens, and that when the overgrown and rank jungle is cleared away, improvement in the health of the people will follow.

115. In the *Dacca* district fever prevailed less extensively but somewhat more fatally than in the preceding year. Fifty-six per cent. of the villages were affected against 60, and the deaths amounted to 28,358, or at 13·39 per 1,000 of population, against 27,150 deaths, or at 12 82 per 1,000. January, November and December were the worst months; and the areas indicated in the margin suffered the most. Dr Crombie reiterates his belief, and the Magistrate, Mr Wyer, from his experience in Faridpore, endorses it, that the causes which determined the variations in the incidence of fever in the various parts of this district are, "the general tendency towards silting up of the whole river system in the district owing to changes in the course taken by the bulk of the Brahmaputra water, which instead of passing, as it formerly did, through the extreme eastern portion of the district into the Megna, now flows to the west of it through the Jumuna into the Pudma Ganges. This is a general cause affecting the whole district, but certain portions of it being surrounded on all or several sides by rivers which have ceased to be navigable, except in the rains, and are at the same time underlain by an impermeable layer of blue clay, have been chiefly affected by this cause. These portions of the district are comprised in the circles of Manikgunge, Jaffirgunge, Harrirampore and Nawabgunge, and in these areas the mortality from fever has indeed been severest," *vide* table furnished above.

	Ratio per *mille*		Ratio per *mille.*
Manikgunge town ...	29·23	Manikgunge thanah	18·92
Jaffirgunge thanah ...	26 02	Nawabgunge „	17·31
Harirampore „ ...	24·02		

116. *Faridpore.*—The sickness and mortality in this district were greater in comparison with their incidence in 1882. It recorded 16,482 deaths, or in the proportion of 10·10 per 1,000 of population, as occurring in 57 per cent. of the villages, in opposition to 13,998 deaths, or at 8·57 per 1,000, in 54 per cent. of the villages. The months of greatest suffering were October, November and December, but only the Faridpore municipality returned a conspicuously high death-rate. Up to September there was nothing unusual in the character of the disease. After this it assumed a severe form, proving more fatal, month by month, to the end of the year, and prevailing epidemically in some parts of the district. It was, however, observed that, although the mortality was highest in December, the number of fresh cases had lessened, the deaths occurring, as usual, among those who were suffering from the sequelæ of the fever The fever is reported to be of a malarious type and endemic to the district; not imported. In the Faridpore municipality, including the civil station and seven villages within a radius of about six square miles, it prevailed severely, in some parts epidemically, but least in the town portion. About four-fifths of the inhabitants had one or two attacks during the last quarter; many had two or three relapses, and in a great number

of the poorer classes enlargement of the spleen and liver, jaundice, diarrhœa and, in some cases, dropsy supervened. The oldest inhabitants of the town said that they had not seen the disease prevail with such intensity within the last 15 or 16 years. The Civil Surgeon ascribes the fever in the district in general, and in the town in particular, to local insanitary conditions, want of conservancy arrangements, defective drainage, bad water-supply, absence of perflation of air and light caused by trees and shrubs growing in close proximity to dwellings, interments within the compound of houses, crowding in small huts, exposure to alternations of climate, obstruction of the natural drainage from silting up, and changes in the river system and from other causes, absence of floods to scour away accumulations of filth and other impurities, and the comparative greater and more rapid drying up of the soil by evaporation.

117. The *Backergunge* district with a further extension of the disease returned a much lower mortality than in 1882. The percentage of villages affected by it was 65 against 58, and the mortality was represented by 27,710 deaths, or at the rate of 14·57 per 1,000 of population, against 31,994 deaths, or at 16·83 per 1,000. Only the Medhigunge and Barisal thanahs suffered with anything like noticeable severity, the death-rates in them being 18·79 and 18·34 per 1,000 of population respectively. Although the insanitary conditions prevailing in Medhigunge are not greater than elsewhere, there are extensive churs in it covered with null and hogla; the drainage is imperfect; and, being situated on slightly higher ground than the other thanahs, is never long submerged during the greater part of the rains. The disease is said to prevail most in this district during the hot months, when the rains are absent, and the subsoil water is low, and again during the cold months when, in addition, the temperature is depressed, causing chills which predispose the native constitution to attacks of fever. In the Civil Surgeon, Dr. Meadow's opinion, Backergunge is by no means a malarious district, as only mild cases of ague, as a rule, are seen, remittents or chronic malaria being rarely met with.

118. In the *Mymensing* district the disease was considerably more diffused and fatal than in the preceding year. Twenty-five thousand one hundred and thirty-eight deaths, or at the rate of 8·23 per 1,000 of population, were reported from 41 per cent. of the villages, against only 16,514 deaths, or at 5·41 per 1,000, in 20 per cent. of the villages. November and December were the worst months, and in only three circles, viz., the town of Jamalpore (20·07 per 1,000) and the rural areas of Pingna (19·27 per 1,000) and Kishorgunge (19·22 per 1,000), the mortality was noticeably high. The localities near the Garrow Hills and the Madhupore forest, where jungle and rotting vegetation abound, and the condition of the tanks is bad, again suffered severely from fever. The Sudder station and its surroundings are said to have grown more malarious during the past four or five years. This is referred to the silting up of the river Brahmaputra increasing year by year, so that its volume of water is at present little more than half what it was five years ago. The silting and drying up of the rivers is said to seriously and materially obstruct the drainage not only of the Sudder station, but also of a large tract of the district, where also the means of communication and traffic are considerably curtailed. This action of the river of late is believed by the Magistrate to be chiefly attributable to the Public Works Department having ceased to keep up the bamboo weirs to concentrate the flow in one channel during the cold weather, in order that the channel might be made deeper for navigation, but which has now been given up owing to the new Railway being in course of construction. A large number of kutcha houses, huts and jungle in the town have, however, been removed in connection with the Railway, and this, it is hoped, will prove beneficial to the health of the people. The type of the prevalent fever is reported by the Civil Surgeon to be of a low rather than an acute character, and its duration somewhat prolonged. He has, however, no reason to believe that there was increased mortality from this cause, although the recorded number of deaths, as shown above, is numerically much larger than the numbers of preceding years. In this district "the physique of the people generally is decidedly poor, the average weight of an adult male being only about 104lbs. with an average height of 63½ inches.

119. *Chittagong.*—In this district also the fever was more widespread, but the mortality lower, in comparison with the outcome of the preceding year, as 79 against 62 per cent. of the villages were affected, and 11,444, or 10·10 per 1,000 of the population against 13,648 or 12·05 per 1,000, died. January and December were the most sickly months, but no area in the district exhibited an exceptional death-rate, although all the villages in the Mirserai, Satkanya and Hathazari thanahs were pervaded by the disease.

120. The incidence of the disease in *Tipperah* was similar to that in Chittagong, for 68 against 56 per cent. of the villages were involved, the mortality stood at 14,598 deaths, or at the rate of 9·60 per 1,000 of population against 14,995 deaths, or at 9·86 per 1,000, and January, November and December were the most unhealthy months. Here also in no area did the mortality rise to a noticeable rate. With regard, however, to the distribution of fever in the district, the Civil Surgeon writes:—"The most unhealthy parts of this district are those towards the west, where the general level of the land slopes towards the river Megna, which with its numerous tributaries keeps the soil water-logged and the sub-soil water level close to the surface. On the other hand, in the eastern portion, where the general level of the ground rises gradually as the district debouches into Hill Tipperah, and where the natural drainage is better and the soil less water-logged, the prevalenc of fever, in fact of all diseases, was less."

121. In the *Noakhali* district the area affected by the disease was the same as in the preceding year, viz. 71 per cent. of the villages, and the mortality somewhat lower, the casualties amounting to 11,341 against 11,725, or in the proportion per 1,000 of population of 13·81 against 14·28. Here also the months in which the largest number of deaths occurred were January, November and December. Only the Hattia thanah suffered exceptionally, its death-rate being 21·19 per 1,000 of population. It is said that the fever in this district is not of a fatal type at its onset, but that if it continues for a time, it brings on spleen and liver complications and general cachexia with its attendant diseases and eventual death. It is referred to dampness of the soil caused by the annual submersion of the country during the rains.

BEHAR.

122. The fever statistics of this division of the Province for the year under review present very little variation in comparison with those for the preceding year. The deaths numbered 261,331, being in the proportion of 11·29 per 1,000, among a population numbering 23,127,104, as opposed to 266,051, or at the rate of 11·50 per 1,000, in 1882. In seasonal incidence July to December exhibited higher mortality than the other months.

123. *Patna.*—The prevalence and fatality of fever in this district exhibited great diminution in contrast with the returns of 1882. 71 against 99 per cent. of the villages were affected, and the deaths amounted 22,790, and the casualty-rate to 12·97, against 31,131 deaths and 17·71, the death-rate per 1,000. July to December were the most fatal months, and the Dinapore and Barrh rural circles suffered the most, the casuality-rates in them being 30·61 and 18·01 per 1,000 respectively. The Sanitary Reports do not present any information worthy of record, except that typhoid fever, attended with many fatal results, occurred among the European soldiers in the Dinapore Cantonment.

124. In the *Gya* district also the sickness and mortality were comparatively less. 50 against 53 per cent. in 1882 of the villages were affected, and the mortality amounted to 30,465, or at 14·33 per 1,000 of population, against 31,180 deaths or at 14·67 per 1,000. August to November were the most unhealthy months, and the Sherghati thanah and the urban and rural areas of Gya returned the highest death-rates, viz. 22, 19·66 and 18·68 per 1,000 of population respectively. The local reports do not record any noteworthy information.

125. The *Shahabad* district exhibited, in contrast with 1882, a small reduction in the prevalence, but a very marked diminution in the fatality of the disease, as will be seen from the following figures. Percentage of villages

attacked 72 against 78; deaths 24,890 against 36,643;* and death-rate per 1,000 of population 12·66 against 18·64. No area suffered exceptionally. This comparative immunity from the disease is ascribed to the great dryness of the climate of the year, caused by a very deficient rainfall. The malady proved most fatal during the third and fourth quarters of the year, that is during the seasons of moisture and evaporation, showing that the fevers are chiefly malarial But it was observed that autumnal fevers did not assume the frequency and severity which characterized them in former years.

126. In the *Mozufferpore* district 21,535 deaths, being in the proportion of 8·34 per 1,000 of population, were recorded in 62 per cent. of the villages, against 25,601 deaths, or at 9·91 per 1,000, in 59 per cent. of the villages in 1882, indicating an increase in the area of disease accompanied by a decrease in mortality. The returns do not show that any circle suffered with exceptional severity, but the Magistrate during his tour found that the fever was very widespread and had a very disabling effect on the people. In its severe form he found it prevalent in the Midnapore and Chundrahatti outposts in the Sudder sub-division. These places have the unenviable reputation of being the most unhealthy localities in the district, and they suffered most after the subsidence of the inundation in August, of the Little Gunduck, Baghmati and Adhwaria rivers, which rose to heights previously unknown, and kept the whole country submerged for fully three weeks, leaving behind a large deposit of decaying vegetation. Another reason advanced by the Magistrate as to why the fever was so severely prevalent in the district is unseasonable rainfall and variations of temperature. The rainfall of June was heavy (20·09 inches), and was succeeded by an intense heat and followed by heavy rain in July and August (10·07 and 11·75 inches respectively) and an almost entire cessation in September. The injured crops remained on the ground and rotted, and the heat was constant throughout September and October, when there ought to have been rain and comparatively cool weather. The Civil Surgeon again refers to the subject of inundations having, according to popular belief, a prejudicial effect on the public health, which he considered an open question, *vide* last annual Report. In making the following observations he evidently refers to the cyclonic vortex which passed over the district in June, accompanied by a heavy rainfall on the 16th and 17th of that month, particularly at head-quarters and in the south of the district, and not to the August inundation mentioned by the Magistrate. This flooding in June drained off quickly everywhere, except from low lands. He says, inundations annually occur towards the end of the rainy season, but during the year under notice it took place so early as in June, when 20·09 inches of rain were registered against 5·98 in the same month in 1882, and a vast extent of country comprising the southern portion of the district, including the town of Hajipore and the Lalgunge and Mahua thanahs, was submerged, and in this area the fever prevailed most, in fact, according to general opinion, epidemically. Moreover, the inundation left in many places as it subsided a large deposit of silt and decomposing vegetable matter; and to this circumstance was superadded an almost entire absence of rain, September registering only 4 and October ·03 inches, during which the powerful heat no doubt caused exhalations from the deposits left by the receding waters, which proved detrimental to the public health.

127. In the *Durbhanga* district the disease prevailed somewhat more extensively and fatally than in the preceding year. Thirty-six against 32 per cent. of the villages were covered by the disease, and 26,496 persons, or at the rate of 10·06 per 1,000, died, against 26,167 or at 9·93 per 1,000. October to November were the worst months, but no circle exhibited exceptional suffering. Nevertheless, the Magistrate states that, the disease was present in fatal form at the close of the rainy season in Tajpore and Dulsinghsarai in the Tajpore sub-division, gradually spread throughout the whole sub-division, and extended to the eastern portion of the Sudder and to a part of the Madhubani sub-division. This outbreak is referred by him chiefly to alternations in climate, the cold weather having set in very early, the mornings and evenings being very cold and the days very hot. The Civil Surgeon observes that "fever in

* The figures of 1882 include the 12,430 deaths which had been omitted from the returns, but supplied afterwards, for reasons explained in the annual Report for that year.

this district is attributed to the generally low level of the country and to the yearly occurrence of inundations which leave large marshy tracts which never dry up."

128. *Sarun.*—The distribution of fever in this district was somewhat wider and the mortality higher than in 1882, 49 against 45 per cent. of the villages having been affected by the disease, and the mortality amounting to 13,459 deaths, or in the proportion per 1,000 of population of 5·90, against 11,832 deaths or at 5·18 per 1,000. The months of September to December were more unhealthy than the other months, but the mortality was noticeably high nowhere. The greater prevalence of fever this year is ascribed by the Civil Surgeon, Dr. Russell, to "irrigation and the greater difficulty experienced in draining the country owing to the Railway now forming a bund across it."

129. *Chumparun.*—Compared with 1882, the fever in this district was somewhat more prevalent, but the mortality was considerably higher, the deaths of 18,559 persons, or at the rate of 10·78 per 1,000, having been recorded in 31 per cent. of the villages, against 12,093 deaths, or at 7·02 per 1,000, in 26 per cent. of the villages. The disease is said to have prevailed most "when there was no rain," during February, March and December, and during the "three months after the heaviest rainfall of the year"—September to November. Although no area presented a high mortality, the notoriously unhealthy thanahs of Bagaha and Louria, lying between the Himalayas and the river Gunduck, were most affected.

130. In the *Monghyr* district 16,352 deaths were recorded in 35 per cent. of the villages, being in the proportion of 8·30 per 1,000 of population, against 20,730 deaths in 36 per cent. of the villages, or at 10·52 per 1,000 in 1882, denoting a decline in both sickness and mortality, the latter to a considerable extent. The severity of the disease was felt most during October to December, and the Jamalpore thanah and Shekpura town again presented the highest death-rates, viz. 23·79 and 19·57, per 1,000 of population. The Sanitary Reports contain no information of interest regarding the prevalent fever, excepting that the Beguserai and Gogri thanahs suffered severely as they did in former years. It was reported last year that the Gogri thanah had become more exposed to fever attacks since the Koosee river altered its course.

131. *Bhagulpore.*—In this district 28,090 deaths, or at the rate of 14·28 per 1,000 of population, were reported from 41 per cent. of the villages, against 25,956 deaths, or at 13·20 per 1,000, from the same percentage of villages, in the preceding year, indicating a higher mortality without any greater extension of the disease. The months of severest suffering were January, April, November and December, and all the villages in the Kissengunge, Bhagulpore, Bihipore, Banka, Madehpur and Supul thanahs were pervaded by the disease. The great unhealthiness of Kissengunge, in which, however, the disease was not very fatal, as well as of Pertabgunge thanah, which recorded a death-rate of 17·29 per 1,000 of population, is attributed by the Magistrate to the inundation of the Koosee river. The Civil Surgeon notes that the early closing of the rains caused a considerable decrease of fever in Madehpur, but this is one of the thanahs all the villages of which were overrun by the disease.

132. In the *Purneah* district the percentage of villages attacked was 61 against 59, and the casualties amounted to 30,340, being in the proportion of 16·41 per 1,000 of population, against 30,225, or at 16·34 per 1,000 in 1882, indicating that the disease prevailed in a somewhat enlarged area and with a slightly increased severity. November was the only month in which the disease exhibited marked activity, and the marginally noted areas returned the largest proportions of deaths. Every village in the Bularampore, Kadwa, Kissengunge and Amur Kasba thanahs, as well as in thanahs Purneah, Gondwara and Arrarea in which the mortality was not conspicuously great, was pervaded by the disease. Beyond the statement by the Civil Surgeon, that "even when there is less rain, less saturation and less evaporation, increased cold and great difference of temperature during the

	Ratio per *mille*		Ratio per *mille*.
Purneah town ...	27·83	Kadwa thanah...	18·85
Bularampore thanah	24·30	Kissengunge „ ...	18·40
Ranigunge „ ...	20·20	Amur Kasba ...	18·17

day and night will induce fever," the local Reports do not furnish any information of interest.

133. The statistics of the *Maldah* district indicate that, in comparison with 1882, there was a marked extension in the area of disease associated with a large decrease of mortality, thus: percentage of villages affected, 79 against 63; deaths 11,176 against 12,949; death-rate 15·73 per 1,000 of population, against 18·22 per 1,000. The fever of 1883 was a continuation of that which prevailed in 1882. It was severe in January affecting principally the Maldah, Ratua and Kharba thanahs. It died out at the end of this month, but broke out afresh and rather virulently in April, spread all over the district, and continued to prevail to the end of the year, but displayed greatest activity in October, November and December. On the whole, however, the suffering was greatest in the Maldah and Gojol thanahs, which presented death-rates amounting to 21·31 and 19·80 per 1,000 of population respectively. Every village in the Maldah thanah was attacked. Referring to the excessive prevalence of the disease, the Magistrate writes:—"This was due not to the great scarcity of food which was much felt, but, probably, to the general stagnation of water consequent upon deficient rainfall and want of high floods to replenish and freshen the ordinary sources of water-supply. The gradual deterioration of the rivers and, apparently, of the general water-supply in the part of the country east of the Ganges is a very serious drawback to the prosperity and health of the residents of the district. Since the high inundation of 1879, year after year the country has suffered from insufficiency of moisture. Latterly, owing to the failure of rain, the ryots used much of their ordinary water-supply for irrigating their rice crops. The want of water for domestic purposes—in fact water famine—is a consequence much felt over wide areas in the Bhurind tract away from the river." The Civil Surgeon, alluding to the same subject, the causation of the fever, very pointedly remarks that "groups of people congregated thickly together in villages surrounded by soil sodden and saturated by the excremental discharges of years, little or no ventilation, air poisoned by the miasmatic exhalations of decaying animal and vegetable debris, and water rendered impure by nature and art, are all quite sufficient to account for the spread, if not the origin, of disease in an Indian village."

The districts of Maldah and Purneah belong more properly for geographical position and climate to Bengal, but are under the administration of the Commissioner of Bhagulpore.

134. In the *Sonthal Pergunnahs*, while the disease prevailed less diffusely, the mortality was considerably higher, as compared with 1882. The percentage of villages affected was 39 against 48, and the deaths amounted to 17,179, or at 10·95 per 1,000 of population, against 13,974, or at 8·91 per 1,000. No area presented exceptional mortality. The severity of the disease, such as it was, commenced to be felt in March with the advent of the hot weather; by May it spread all over the district; and during July, August and September it attained maximum intensity and was most fatal. In October there was a decrease, which was more decided in November and December. It is said to have prevailed extensively in the western half of the district embracing the subdivision of Deoghur, Godda and part of Dumka. This part of the district is high, consisting of low hills, undulating lands, and basaltic rocks, and laterite; but the eastern half, containing the sub-divisions of Pakour and Rajmehal, which is chiefly alluvial, and contains much low land, and which had hitherto suffered more from malarial fever, was comparatively healthy this year. This immunity is ascribed to the scarcity of rainfall and the absence of flooding of the river Ganges. Referring to the type of the fever, the Civil Surgeon, Dr. Barker, writes:—"There is no doubt that this fever, which is similar in all its features to what is called the Burdwan fever, is steadily increasing, and the great mortality proves it is more severe and widespread than it was some years since; but owing to the physical characteristics of the country, it is not likely to gain the same ascendancy here as it did in Lower Bengal, if we are to believe in its malarious origin and the factors necessary to produce that subtle poisons—*malaria*." In the town of Dumka the disease did not prevail severely, and the fatal remittent type of the disease which was present in 1882 was almost entirely absent this year.

ORISSA.

135. As in the preceding year, fever prevailed least in this division of the Province, but in relative incidence, the mortality had abated but little. The recorded deaths amounted in a population enumerated at 3,628,832 to 24,672 against 25,030, and the death-rate to 6·79 against 7·01 per 1,000 in 1882. In seasonal activity December, November, October and January took the lead of the other months in the order noted.

136. The fever statistics of the three districts composing this division may be considered together, as the mortality which occurred in them was not very great, no area presenting a noticeably high death-rate. The local Reports present nothing important connected with the fevers which prevailed, except that the Civil Surgeon of *Cuttack* observes that ordinary intermittents and remittents occur chiefly in the low localities towards the Coast and in the hilly tracts on the western side of the district; and the Magistrate of *Balasore* fears that the fever in his district is identical with the Burdwan fever, which, having invaded Midnapore, first appeared in Jelasore, and, having slowly descended southwards through Basta and Baliapal, is now near the Balasore town. The figures of these districts are given below:—

	Percentage of villages affected.		Deaths.		Ratio per mille.	
	1883.	1882.	1883.	1882.	1883.	1882.
Cuttack	37	34	12,806	12,471	7·13	7·17
Poori	46	32	4,443	5,082	5·00	5·71
Balasore	42	43	7,423	7,477	7·85	7·90

The comparison of the results of 1883 with those of 1882 discloses no marked variation in both sickness and mortality, excepting that in Poori a larger area was affected by the disease. On the whole, however, there was a little abatement of mortality in all the districts. It should, however, be mentioned that in Cuttack a new area, Banka, was brought under registration during the year under review, for which no records exist for the preceding year. This accounts for the deaths being numerically greater and the proportion of mortality to population being less, as exhibited in the above table.

CHOTA NAGPORE.

137. The prevalence and fatality of fever in this division of the Province were not excessive. The number of deaths reported to have occurred in it was 51,289, or in the proportion of 11·83 per 1,000, among a population numerically returned at 4,334,178, as opposed to 54,158 deaths or at 12·49 per 1,000 in 1882, indicating a small reduction of mortality. The disease commenced to be active in April, and continued to do so till September, in which month it reached maximum severity. In October it prevailed almost as severely as in September, but in November and December it exhibited a decline.

138. The figures representing the sickness and mortality in the four districts which form this division are noted below:—

	Percentage of villages attacked.		Deaths.		Ratio per mille.	
	1883.	1882.	1883.	1882.	1883.	1882.
Hazaribagh	67	60	15,172	14,175	13·73	12·83
Lohardugga	47	43	20,253	21,820	12·58	13·65
Singbhum	63	70	5,595	6,112	9·95	10·87
Manbhum	55	53	10,269	12,051	9·70	11·38

These figures indicate that in *Hazaribagh* both the sickness and mortality had increased, while in *Singbhum* the contrary was the case; and that in Lohardugga and Manbhum an expansion of the area of disease was associated with a decline in mortality, notably in the latter district. Turning to the returns of the circles in these districts, it is seen that in only those named in the margin the mortality was high. No information possessing any special interest is contained in the Sanitary Reports received from these districts.

139. **Fever in the Port of Calcutta.** The mortality from fever among the European seamen in the *Port of Calcutta* was inconsiderable. Of malarious fevers there were 323 admissions into hospital, attended with four deaths, giving a death-rate of 2·15 per 1,000 of population according to the estimate of the Health Officer of the Port, as opposed to 251 admissions and five deaths, or at the rate of 2·79 per 1,000, in 1882, indicating an extension of sickness associated with a decline in mortality. Of simple fever 114 against 186 were admitted into hospital, but in both years this class of fevers produced no fatal result. It is gratifying to record that enteric fever, which occurred fatally among the European seamen every year since 1878, was absent from the Port this year.

Among European Seamen.

140. The recorded mortality from fevers among the native floating population indicates a decline in mortality, as there appears to have occurred among them eight deaths from malarious fever, or at the rate of ·31 per 1,000, against 26 deaths, or at 1·12 per 1,000 in the preceding year, and 14 deaths from simple fever, or at ·55 per 1,000, against no deaths in 1882.

Among the Native Floating Population.

BOWEL-COMPLAINTS.

141. Reasons have been submitted in the Reports of former years, showing that there is no doubt that the mortality from bowel-complaints has always been enormously under-registered. The year under review forms no exception to this rule. Its records, as they stand, show that 55,270 deaths, or in the proportion of ·83 per 1,000 of population, occurred from this class of diseases in 9 per cent. of the total villages in the Province, the figures of the preceding year being deaths 61,362, death-rate ·92 per 1,000, and percentage of villages affected 10; and that in 11 against 16 of the registering circles, the maladies prevailed with some severity; in 619 against 607 they exhibited no abnormal intensity; and from 18 against 21 they were absent. These figures indicate that the diseases were less diffused, and that the mortality had at the same time abated. The contributions towards the total casualties of the year from the urban and rural circles were 8,760 deaths, or at 3·54 per 1,000 of population by the former, and 46,510 deaths, or at ·73 per 1,000, by the latter.

Extent of prevalence and fatality of Bowel-complaints.

142. This information is shown below in columns according to districts, towns and rural circles:—

Areas which suffered most from Bowel-complaints.

Districts.	Ratio per mille.	Towns.	Ratio per mille.	Rural Circles.	Ratio per mille.
Balasore	5·28	Revilgunge ...	8·08	Basta in Balasore ...	11·08
Howrah	3·85	Poori	7·24	Dinapore in Patna ...	8·44
Poori	2·58	Patna	7·11	Balasore ...	7·01
Patna	2·20	Midnapore ...	6·82	Dighwara in Sarun ...	6·70
Hughli	2·08	Suburbs of Calcutta ...	6·74	Basudevpur in Balasore	6·18
		Durbhanga ...	6·65		

143. The marginal figures, indicating the seasonal incidence of bowel-complaints, again denote that the morning and evening damps and chills and great alternations of temperature of July, August and September, and the extreme cold night air and heavy dews of January, November and December cause large numbers of the poor, insufficiently clad, and poorly fed portion of the population to succumb to the influence of these maladies. To these causes may be added errors of diet, bad water, and malaria as aids to the propagation of the diseases.

Seasonal incidence of bowel-complaints.

	Deaths.		Deaths.
December ...	5,578	April ...	4,552
August ...	5,173	October ...	4,446
January ...	5,123	May ...	4,221

September ...	4,787	March ...	4,056
July ...	4,574	June ...	3,814

144. The table in the margin indicates that while, on the one hand, diarrhœa prevailed to a greater extent among the European seamen than during the preceding year, and was associated with no deaths, dysentery, on the other hand, attacked a smaller number, and was

Diarrhœa and Dysentery in the Port of Calcutta.

	Cases. 1883.	Cases. 1882.	Deaths. 1883.	Deaths. 1882.	Ratio per mille. 1883.	Ratio per mille. 1882.
Diarrhœa ...	164	143	...	2	...	1·11
Dysentery ...	90	146	4	8	2·15	4·46

attended with four deaths, representing about half the mortality of 1882. The casaulty-rate among the native floating population from those diseases was, although higher than in the preceding year, still low, viz. ·07 per 1,000 of population from diarrhœa and ·47 per 1,000 from dysentery.

INJURY.

Mortality from Injury.

145. The casualties from injury amounted during the year under review to 23,670, or in the proportion per 1,000 of population of ·35, in opposition to 21,611 deaths, or at the rate of ·32 per 1,000 in the preceding year, indicating that there was an increase in the fatal results from this death-cause to the extent of 2,059. The urban circles returned only 4 per cent. of the total deaths from injury, against 96 per cent. in the rural circles, showing that the rural population are, for obvious reasons, more exposed to death from violence than the urban population.

Mortality from the different classes of Injury.

	Suicide.				Wounds.		Accident.		Snake-bite and killed by wild beasts.	
	Deaths.			Ratio per cent. to total deaths from Injury.	Deaths.	Ratio per cent. to total deaths from Injury.	Deaths.	Ratio per cent. to total deaths from Injury.	Deaths.	Ratio per cent. to total deaths from Injury.
	Male.	Female.	Total.							
In 1883	928	1,544	2,472	10·44	1,513	6·39	9,614	40·61	10,071	42·54
In 1878-82 ...	922	1,484	2,406	10·89	1,208	5·87	8,644	38·68	9,837	44·54

146. The comparison instituted in this table again indicates that the largest proportion of deaths from violence is caused by snakes and wild beasts; that accidents furnish the next highest mortality; that suicide follows accidents, the largest proportion of deaths from this cause being furnished by women; and that wounds cause the least number of deaths.

Seasonal incidence of death from Violence.

147. The greatest loss to life from violence occurred during the rainy months from June to September. During this period 13,475 deaths, representing nearly 57 per cent. of the total casualties of the year, were recorded. This recurs year by year from causes explained in former Reports.

OTHER DISEASES.

Mortality from Other Diseases.

148. The registered casualties from the diseases which have not been considered in the foregoing portion of this Report, and which are classed under the above-mentioned head, amounted to 152,817, *i. e.*, in the proportion of 2·30 per 1,000 of population against 140,732 deaths, or at 2·12 per 1,000 in the preceding year, showing an increase of mortality to the extent of 12,085 deaths. The areas which bore the severest suffering from these diseases are those named below :—

149. **Port of Calcutta** —From this cause three out of four cases died in hospital, or in the proportion of 1·61 per 1,000 of average strength, and two out of hospital. In the preceding year the admissions into hospital amounted to 5, the deaths to the same number as in this year, and the death-rate to 1·67 per 1,000. Two of the casualties of the year occurred on boardship; but there is no reason to believe that the instructions issued by the Port Commissioners for the protection of crews during the hot season were not complied with in any of the cases.

Mortality from Heat Apoplexy.

150. There was a considerable reduction in the number of admissions into hospital from scurvy, the diminution amounting to half the admissions of the preceding year, viz. 14 as against 28. Happily, as in 1882, none of these cases terminated in death. They were present on board of seven vessels, and, on enquiry, no cause favouring the disease was found to exist in any of them, excepting in one. This vessel, it appears, left the West Indies without taking a fresh supply of lime juice, and the result was that the existing stock having failed during the voyage the disease appeared among the crew.

Prevalence and mortality from Scurvy.

151. One thousand one hundred and sixty-nine European seamen against 1,426 during the preceding year were admitted into hospital from diseases classed under the head of "other causes," and of this number 33 died, being in the proportion of 17·74 per 1,000 of average strength against 29 deaths, or at 16·18 per 1,000, indicating a sensible reduction in sickness associated with a rise in mortality. These figures are exclusive of 7 casualties from these causes which occurred out of hospital against 4 in 1882. Of the 33 deaths in hospital, 15 were caused by diseases not referable to climatic or local conditions, viz. 12 from phthisis, 2 from heart disease, and 1 from aneurism. The remaining 18 died from such diseases as pneumonia, pleurisy, hepatitis, cerebral conjestion and drowning. The casualties out of hospital were traced in one case to accident and in the rest to drowning. Of the native floating population 24 died from the diseases discussed in this paragraph, being at the rate of ·94 per 1,000 of population. This mortality is lower than that of 1882, during which 36 died, or at the rate of 1·41 per 1,000.

Mortality from "Other Causes."

SECTION VII.

GENERAL HISTORY OF VACCINATION.

Year of Report.

152. The history of vaccination considered in this section is for the official year 1883-84.

Officers in charge of the Circles.

153. During this year the following officers held charge of the circles in which vaccine operations are carried on :—

Calcutta.—Surgeon-Major K. McLeod, throughout the year.

Metropolitan Circles, including *the Suburbs of Calcutta.*—Surgeon-Major K. P. Gupta, throughout the year.

Darjiling Circle.—Surgeon-Major J. J. Wood, throughout the year.

Ranchi Circle.—Surgeon W. Owen, throughout the year.

Sonthal Pergunnahs Circle.—Dr. R. A. Barker, throughout the year.

Eastern Bengal Circle.—Apothecary A. Lyons, throughout the year.

Behar Circle.—Assistant Surgeon Mothura Nath Sen, throughout the year.

Orissa Circle.—Assistant Apothecary P. Veariah Naidu, throughout the year.

154. *Strength of the Working Establishment.*

Several modifications of the working establishment took place during the year, involving, on the whole, an increase of five inspectors and 127 licensed vaccinators, and a decrease of five native superintendents, four Government vaccinators, and 10 apprentices; but in no case was the sanctioned establishment exceeded. These changes were due to the following causes: In the *Darjiling* Circle, the major portion of the paid subordinate establishment being no longer required, owing, as reported last year, to the extension of the licensed system of vaccination to the entire circle except its hill portion, there was a reduction of seven native superintendents, 41 vaccinators and 39 apprentices. Of the native superintendents four were made inspectors in this circle, (whereby effect was given to the orders of Government sanctioning the inspectors who were required for the supervision of operations under the licensed system of vaccination), and one was transferred to the *Eastern Bengal* and one to the *Behar* Circle. Of the vaccinators and apprentices, 27 of the former and 15 of the latter were transferred to the *Eastern Bengal* Circle, and 14 of the former and 14 of the latter to the *Behar* Circle, thus increasing the staff of native superintendents, vaccinators, and apprentices in these circles. It is not stated how the remaining 10 apprentices were disposed of. It is possible that they were licensed to practise vaccination. From the *Ranchi* Circle one native superintendent was transferred to *Behar*, and a head vaccinator was received in his place from the latter Circle, and this accounts for the changes in the strength of these officers indicated against these two Circles. The further change of establishment in the *Eastern Bengal* Circle is an increase of one inspector. This was brought about in the following manner. An Assistant Surgeon was appointed in the room of the Deputy Superintendent who was formerly an inspector, as it was considered that the important and responsible post of Deputy Superintendent should be held by a class of officers superior to that of vaccinators. The ex-inspector reverted to his former post. The increase of 127 licensed vaccinators was due to the *Metropolitan* Circles having employed 36 additional men, *Darjiling* 19, *Ranchi* 37 and *Eastern Bengal* 35, the requirements of the year necessitating these additions.

Irrespective of the above changes, two Deputy Superintendents in the Metropolitan Circles—Assistant Surgeons Ram Soonder Ghose, Rai Bahadoor, and Buddynath Brummo—retired on superannuation pensions. Assistant Surgeon Neem Chand Gupta, who was in charge of the Suburbs of Calcutta, was promoted to one of the vacancies, and the other was filled up by Assistant Surgeon Kashi Chunder Dutt. The appointment of Assistant Surgeon Neem Chand Gupta was given to Assistant Surgeon Priumbur Nath Mitter. In the Darjiling Circle also a retirement on pension took place, viz., of inspector W. C. Mukerjee, and his place was given to a native superintendent. Death

removed one native superintendent from the Ranchi Circle and one inspector from the Darjiling Circle.

Conduct of Establishment.

155. The conduct of the Vaccination Department establishment during the year was, on the whole, good, excepting in the Ranchi Circle, where the Superintendent is doing his best under many disadvantages to bring about a better state of discipline; and in the Sonthal Pergunnahs Circle, where the men generally are reported not to have behaved so satisfactorily as in former years, resulting in a large number of them having been punished for various offences. Those of the establishment who were reported to be deserving of special commendation were: In the *Darjiling* Circle, Deputy Superintendent Tajumul Hossein, who maintained during the year the zeal, energy and tact which characterized his work in former years. In the *Eastern Bengal* Circle, Inspector Abdul Hamid, who displayed similar good conduct. In the *Ranchi* Circle, Inspector Allimuddin, who supervised the staff under him with noticeable tact; Vaccinator Luchman Sahi, who performed his work willingly and cheerfully, and exhibited untiring energy in assisting the Superintendent in inspection work; and Inspector Aughor Nath Sircar, who successfully introduced bovine vaccination in the circle, displayed steady perseverance in overcoming the prejudices of the people against the measure, and procured calves for the extension of the work. The Superintendent recommends the last named officer for promotion. On the other hand, several officers were punished for grave misconduct. In the *Ranchi* Circle a large number of vaccinators were punished for breaches of discipline and neglect of duty. In the *Sonthal Pergunnahs* Circle the case of Assistant Surgeon Probodhe Chunder Bose, the Deputy Superintendent, has already been submitted to Government for consideration. It is to be regretted that this officer, who has hitherto always been reported to have performed his duties with commendable energy, zeal and tact, should have failed to maintain this character during the past two years. Two inspectors were fined for making false entries in their registers. A vaccinator was dismissed for falsifying his register and receiving illegal gratification. Another was suspected of the latter offence, and his case is being enquired into. In the *Eastern Bengal* Circle one vaccinator was dismissed for soliciting gratuities from vaccinifers and their guardians, three for refusing to proceed to Noakhalli to suppress an outbreak of small-pox which occurred there, and one for delaying to join his post after expiry of leave. In addition seven vaccinators and four apprentices did not rejoin their appointments after expiry of leave, five vaccinators and five apprentices absconded, and four vaccinators and one apprentice resigned. These men mostly belonged to the batch who had been transferred from Darjiling; and the cause of their not returning to duty appeared to be that they did not appreciate working far away from their homes, and that the cost of living in Dacca during the recess was higher than their recess pay, particularly in the cases of the apprentices. In the *Orissa* Circle two vaccinators were dismissed, one for not returning to duty at the beginning of the season, and the other for absence without leave.

Areas vaccinated and plans which determined the conduct of Operations.

156. A summary of the information under this head is subjoined. Fuller details regarding the exact areas taken up for operations will be found in statement No. A, Appendix VI to this Report.

In the Vaccination Circles.

157. In *Calcutta* vaccination was carried on, as in the preceding year, under the provisions of the Compulsory Vaccination Act, an account of the working of which is furnished in a subsequent paragraph of this section. It will be sufficient here to state that the work was confined within the limits of the metropolis; that it was accomplished by 11 vaccinators under three head vaccinators, supervised by the Deputy Superintendent; that 9,538 persons or at 1·96 per cent. of the population were protected; and that during the recess 1,342 operations, included in the above number were undertaken to keep up a supply of lymph, to vaccinate children whose parents or guardians had neglected to have them vaccinated within the period fixed by law, and to protect the unvaccinated in the neighbourhood of localities where small-pox had broken out.

In the *Metropolitan* Circles the entire area composing it was taken up for operations, and the executive and supervising staff judiciously distributed

over it. The results of this arrangement in each division and district are subjoined:—

Burdwan Division.	Number of vacci-nators.	Number of operations.	Percentage of population protected.	*Presidency Division.*	Number of vacci-nators.	Number of operations.	Percentage of population protected.

Total ...	171	139,365	2·05				

During the recess 1,552 operations were performed at Jelinghi and Bhartpore in Murshidabad, at Karimpore in Nuddea and at Sakulipore in Birbhum. In the *Suburbs* of *Calcutta*, which forms a part of the Metropolitan Circles, 14,397 operations were performed, of which 4,367 were re-vaccinations, the work being pursued under the provisions of the Compulsory Vaccination Act and conducted by 10 vaccinators under 3 head vaccinators, supervised by a Deputy Superintendent. The manner in which this law was worked in this area is shown in a subsequent paragraph of this section.

In the *Darjiling* Circle the operations of the *Government agency*, consisting of five vaccinators under a head vaccinator and supervised by the Superintendent, were limited to the Hill portion of the Darjiling district, composed of the Kalimpong sub-division and thanahs Darjiling and Kurseong. In this area, which is irregularly populated and difficult to work in, owing to the situation of the localities embraced by it varying from a few hundred to nearly 10,000 feet above the level of the sea, with rivers and torrents which are impassable for days in the rainy season, 14,142 operations were performed against 5,435 in the preceding year. There was no work carried on during the recess. The head vaccinator above mentioned also inspected the Darjiling municipal vaccinations, an arrangement which is said to have promoted the protection of the bazars in Darjiling and Jore Bungalow. The *Licensed* vaccinating staff, consisting of 184 vaccinators under 11 Government Inspectors, supervised by two Deputy Superintendents, was distributed over the remaining area of this circle embraced by the districts of Rajshahye, Rungpore, Dinagepore, Bogra, Julpaiguri, Purneah, Maldah, and the Terai sub-division of Darjiling, where a total of 207,394 operations were performed, including 5,731 vaccinations undertaken during the recess by 28 of the vaccinators in Bogra, Rungpore, Dinagepore, the Terai, Julpaiguri and Maldah—in the two last named districts on the appearance of small-pox. The Government Cinchona Garden was also protected.

In the *Ranchi* Circle, where operations were commenced somewhat late in the season owing to the non-arrival of the vaccinators after expiry of leave, the *Government* vaccinators (excluding 2 who were deputed to Singbhum, 1 to Manbhum, 1 to Hazaribagh, and 1 to the Tributary States of Gangpur and Jashpur, to supervise the licensed vaccinators carrying on operations in these areas) were divided into four batches, three of which were distributed over the Lohardugga district taking up the under-mentioned thanahs, and one over the Kolhan in Singbhum. One batch, consisting of nine vaccinators under an inspector, pursued operations in succession in thanahs Ranchi, Choria, Balumot, Lohardugga (all the villages lying to the west of the road running north and south), Biru and Burwya. They performed 9,017 vaccinations. The second batch, composed of nine vaccinators under an inspector, performed 10,536 operations in thanahs Ranchi, Lodhma, Tamar, Bassia and Torpa, which they took up in succession. A third batch of eight operators under a native superintendent commenced work in Kura outpost in thanah Lohardugga, after which they took up the eastern half of the same thanah and, in succession, thanahs Sisoi (late Korambi) and Palkot. This batch performed 11,546 operations. The fourth batch, consisting of eight vaccinators under a native superintendent, worked in the Kolhan in Singbhum. They commenced operations in Chyebassa, and continuing them in 16 groups of villages in succession, covering a large area, vaccinated 5,872 persons. Previous experience

having shown that the people in the Kolhan object to take vaccination from Mahomedan operators, preferring Brahmins who were residents of the place, arrangements were made whereby one Brahmin, four Kayasthas, one Kahar, who passed himself off as a Brahmin, and five Bengali apprentices were associated with the Mahomedan vaccinators. During the recess 1,757 operations were performed, viz., 1,611 in thanahs Palkot, Burwya, Sisoi in Lohardugga, included above, and 146 in Palamow and Bishenghur in Hazaribagh, in order to keep up a supply of lymph, and to meet outbreaks of small-pox. Many difficulties beset the carrying out of vaccination in almost all the above mentioned areas. They will be reported in a subsequent portion of this section. The scene of operations by the *Licensed* agency was Singbhum, (excluding the Kolhan and including Dalbhum) Manbhum and Hazaribagh, and the Tributary States of Sirguja, Udipur, Korea, Jashpur and Gangpur. A staff, consisting of 34 vaccinators under the supervision of two Government vaccinators, spread their operations during the working season throughout *Singbhum*, excepting, as before stated, the Kolhan which was under the Government vaccinators, resulting in the performance of 19,033 vaccinations, including 2,850 performed during the recess. In order to meet the prejudices of the people, above referred to, care was taken to select the operators, so that of them 26 were Tikait Brahmins chiefly from Manbhum, three were up-country men, and one a Mahomedan. In *Manbhum* vaccination was carried on in all its thanahs by 57 vaccinators under a head vaccinator and a vaccinator of the Government staff. The total work of the year amounted to 32,765 operations, of which 834 were performed during the recess in the Bagmundi and Govindpur thannahs owing to outbreaks of small-pox. In *Hazaribagh* 39 men were licensed to practise, and they carried on vaccinations under the supervision of one inspector and one Government vaccinator to the extent of 29,417 operations in thanahs Giridhi, Khurakdiha, Dumurhi, Kashmar, Jageswar, Bagodhar, Hazaribagh, Chorpa or Chowparun, Tandowa and Gowan, of which 1,176 were performed during the recess in Bishenghur, where small-pox had broken out severely. Much opposition to vaccination having been experienced in this district in former years, particularly when the operators were Government men, the Superintendent determined to try the effect of enrolling local men. He, therefore, obtained 37 Sindurias through the Deputy Commissioner, and granted them licenses. These men, as their designation implies, are sellers of sindur (vermilion) and other drugs. They had also followed the profession of inoculators. The result was that the people accepted vaccination from their hands more readily than they did from others, and the outturn of work was better than in the preceding year. It was found, however, that these men were very illiterate, and that it was hopeless to teach them to prepare the returns. This difficulty they, however, staved off by getting their friends to perform the writing for them; but to ensure matters, the Superintendent took from each of them an agreement binding them under a penalty of Rs. 25 to send in their returns punctually, to obey the orders of the inspector, to return the lancets at the close of the season, and not to charge more than two annas for each child operated on. The returns show that 2,751 operations were performed by licensed vaccinators during the recess in thanahs Ranchi and Lodhma in Lohardugga of which no account has been furnished in the Superintendent's report. With regard to the Tributary States, 17 Hindustani licensed vaccinators performed 9,257 operations in *Sirguja*; eight men (four Hindustanis and four Bengalis) performed 4,859 vaccinations in *Udipur*; six men worked in *Korea*, performing 3,134 operations. Ten vaccinators (eight Hindustanis and two Bengalis) operated on 3,022 persons in *Jashpur*; and 12 men returned 4,928 vaccinations from Gangpur. The operations in the three first named States were supervised by an inspector, and those in the two last by a vaccinator, both being Government officers.

In the *Sonthal Pergunnahs*, thanahs Kharakpur, Gogri, Beguserai, Monghyr, Jamui and Chakai in the Monghyr district, and thanahs Bhagulpore, Kolgong, Sultangunge, Bongong, Amarpur, Bihipur and Banka in the Bhagulpore district were taken up this year by the *Government* agency. In the Bhagulpore areas 18 vaccinators, under the supervision of the two inspectors and one head vaccinator, were employed, and they performed 3,865 operations in 137 villages—a very poor result, considering the strength of the staff which

produced it. To the Monghyr thanahs—which it should be mentioned, were taken up for the first time this year—were assigned the largest number of the vaccinators, viz., 41 under two inspectors and three head vaccinators, and the operations were carried on under the immediate supervision of the Deputy Superintendent. The vaccinations performed by this staff amounted to 36,752 in 1,521 villages, including 1,210 operations carried on during the recess for the suppression of small-pox and for keeping up the lymph supply. The *Licensed* agency undertook the vaccination of thanahs Moheshpur, Godda, Jamtara, Mudhupore, Sharat, Pakour, Deoghur including its municipal area, Poraya, Rajmehal, Bahawa, Shahebgunge including its town, Dumka and Mahagawn in the Sonthal Pergunnahs district, and thanahs Supul, Kissengunge and Madehpura in Bhagulpore. To the former area were allotted 56 vaccinators under three inspectors, who returned 64,862 operations in 2,366 villages; and to the latter, three vaccinators under one inspector, who performed 1,506 vaccinations in 56 villages. The recess work, necessited for the usual reasons, amounted to 4,834 operations. It will be noted that licensed vaccinators entered the Bhagulpore district for the first time this year.

In the *Eastern Bengal* Circle the *Government* and *Honorary* staff worked in thanahs Tipperah, Brahmanberia, Nobinnagar, Barakamta and Moradnagar in the Tipperah district, and Netrokona in Mymensing. Towards the end of the season some of the staff took up thanah Kasba in Tipperah, and outbreaks of small-pox necessitated the deputation of vaccinators to thanah Hajigunge in Tipperah, to thanahs Ramgunge, Begamgunge and Lakshimpur in Noakhalli, and to the Barisal town in Backergunge. The circle staff also undertook the vaccination of the Municipalities of Comillah, Brahmanberia and Dacca, in which they performed 747 operations. During the recess 484 operations were performed in the Dacca district for the maintenance of lymph and suppression of small-pox, and 350 in Tipperah for the latter purpose only. The statement in the margin exhibits the distribution of the establishment in the areas operated on and the results. The areas in the Tipperah district were for the first time entered upon during the year under review.

Districts.	Staff employed.				Number of operations.
	Superintendent.	Native Superintendent.	Head vaccinators.	Vaccinators and apprentices.	
Noakhalli	1	1	...	39	35,160
Backergunge	...	......	...	8	5,367
Mymensing	...	......	1	10	9,700
Tipperah	...	......	5	62	144,781
Dacca	...	......	...	......	484

To the *Licensed* agency were assigned the districts of Dacca, Faridpore and Pubna, and the thanahs of Tangail, Gopalpur, Pingna, Jamalpur, Dewangunge, Bazitpore, and Gaffargaon in Mymensing. It also took up the vaccination of the municipal areas of Faridpore, Goalundo, Dacca, Pubna and Serajgunge, and during the recess, with the view of arresting the spread of small-pox, some localities in the Dacca, Faridpore and Backergunge districts. The total number of vaccinations amounted in the former area to 2,604, and in the latter to 2,233. The marginal table exhibits the strength of the staff employed in the above mentioned areas, and the outturn of the work performed in them.

Areas.	Number of licensed vaccinators.	Number of operations performed.
Dacca ...	66	39,590
Pubna ...	32	39,754
Faridpore ...	45	26,181
Mymensing ...	41	49,672
Backergunge ...	(Recess)	27

In the *Orissa* Circle, the operations were conducted in the following areas in the Poori and Balasore districts. In the first named district, the Sudder and Bhanpur thanahs were taken up by 1 head vaccinator and 8 vaccinators and 1 apprentice, who operated in the former thanah on 9,903 persons in 429 villages and in the latter on 9,673 persons in 754 villages. A vaccinator was also sent in the latter part of the season, at the request of Dr. Buckley, Missionary, to village Minchinpatna in thanah Khurda, where he performed 50 operations. The total vaccinations in Poori thus amounted to 19,626. In the Balasore district protection was afforded to the Sudder (including Balasore town), Jellasore, Basta, Bhadrak and Dhamnagar thanahs. In this area 16 vaccinators under 2 head vaccinators performed 24,522 operations in 1,012 villages. In addition to the above, the head vaccinator and 4 vaccinators of the Bhadrak

area were sent in November to the Moharbhanj State to work in Baripada, which had not been protected during the non-working season of 1882-83. This staff operated on 7,518 persons in 431 villages. During the recess 832 person were vaccinated in 54 villages in the suburbs of Cuttack town by some of the Balasore staff for the purpose of establishing lymph, and 44 persons, all unsuccessfully, in four villages in thanah Banki on the occurrence of small-pox in them; aggregating 876 operations in Cuttack.

In the *Behar* Circle, operations were carried on in thanahs Behar, Silao, Atasarai, Massaudhi, Bikram, Futuah, Maner, Dinapore including its town, Bankipore, Barrh, Mokameh, Hilsa and Khwajakalan in *Patna;* in thanahs Dhaka, Motihari, Kasarya, Gobindgunge, Bettiah and Bagaha in *Chumparun;* in thanahs Arrah and Piru in *Shahabad;* and in a few villages in the Jehanabad thanah in Gya. To the first, or Patna area, 23 vaccinators under 2 head vaccinators were allotted, who vaccinated 20,732 persons in 1,051 villages. In the second. or Chumparun area, 16 vaccinators under 1 native superintendent and 1 head vaccinator performed 14,597 operations in 365 villages. In the third, or Shahabad area, 4,255 operations were conducted by 18 vaccinators under 1 native superintendent and 1 head vaccinator in 188 villages—a very poor result. In Jehanabad in Gya 43 operations were performed in six villages by one of the Patna vaccinators. The recess work undertaken for the usual purposes amounted to 4,141 operations (included in the above figures) in the Patna and Dinapore towns, in thanahs Maner and Silao in Patna, and in thanahs Motihari, Dhaka, Kasarya and Bettiah in Chumparun.

In the Municipal Areas.

158. This area embraces 99 Municipalities (including 3 Cantonments) and 27 Dispensaries. In the former and in many of their immediate vicinities, 161 vaccinators performed 65,640 operations, and in the latter 42 operators returned 5,712 vaccinations.

In other Places.

159. In the following places arrangements, other than those mentioned above, obtained. In these areas 21 operators performed in all 5,513 vaccinations, which are included in the statement showing the Municipal work. Protection was afforded to the prisoners in the jails of Julpaiguri, Jessore, Khulna, Mymensing (including the Police), Chittagong, Noakhalli and Chumparun. A vaccinator performed operations in the Chagdighee dispensary in Burdwan at the cost of the Estate of Babu Lalit Mohun Roy, the proprietor of the dispensary. A licensed operator vaccinated the children of the Railway employés on the line of the Northern Bengal State Railway from Sara to Siliguri. In Chittagong a large number of villages in the Puttoah station, and some in the Satkanya and Banskhali stations, and Anwara outpost, were attended to by two vaccinators paid by Government. The Civil Surgeon reports that the two vaccinators allowed by Government to vaccinate this district are not sufficient for effective work, and that more men, under proper supervision, are needed. Operations were carried on in the sub-division of Cox's Bazar by the Assistant Surgeon, and the Kurnafooli and Udalia Tea Estates were protected by two native doctors paid by the Estates. Twenty-five ex-inoculators received licenses from the Civil Surgeon of Shahabad, and they carried on operations wherever they liked in the district, furnishing no returns, except of 200 operations. Parts of 4 thanahs in Tipperah, where small-pox had broken out, were vaccinated by 4 temporary vaccinators engaged by the Magistrate. Two vaccinators performed operations in the Hutwa dispensary, and one each in the Gopalgunge and Bhori dispensaries, in Sarun, at the cost of the Hutwa Raj; and one vaccinator was employed in the Durbhanga dispensary and another in the Neraya dispensary by the Rajah of Durbhanga. In the Bagaha dispensary in Chumparun, vaccinations were performed by the compounder and two ex-inoculators who are mallees, and in the Barharwa dispensary, in the same district, by the peon attached to it; and operations were performed by a vaccinator at the Angul Government Estate and Dispensary at the cost of the Estate.

160. *Port of Calcutta.*—Vaccination in the Port of Calcutta was limited to the crews of vessels specially liable to contract the disease, such as the Maldive boats and Arab buglas. The crew of a steamer in which small-pox had broken out were also operated on.

Degree of protection afforded in the Vaccination Circles.

161. In the town of *Calcutta* there is not a single section to which vaccination has not been extended, but, as stated in former reports, the amount of protection which each section enjoys depends on the class of people residing in it. The sections inhabited by Europeans and the resident Bengalis are better protected than those in which the population is mainly a floating one, or consists of the lower classes of up-country men.

The Superintendent of the *Metropolitan* Circles states that the 11 districts under his supervision have been protected, with the following exceptions. Many villages in thanah Nulhati in Birbhum and in the Murshidabad and Khulna districts, particularly thanah Moreilgunj in the latter, remain unprotected. These villages are occupied mainly by Ferazees, who are stout opponents of vaccination. In the Midnapur and Bankura districts there are here and there still some villages which have not been vaccinated The above is a more qualified statement than those made in former reports, and is supported by the local authorities. Referring to the Ferazee opposition, Dr. Gupta notes that, thanahs Jelinghi, Bhagwangola and Goas in Murshidabad, where this class of Mahomedans reside in large numbers, have, through the assistance of the Magistrate, been protected; but the Civil Surgeon's report shows that the last named thanah suffered exceptionally from small-pox during 1883. He also reports that the Sub-divisional Officer of Bagirhat, in which thanah Moreilgunj is situated, is very indifferent to vaccination, and that when he visited Bagirhat for the purpose of urging that officer to take an interest in vaccination, he refused to see him under the pretence of being "very busy with special duties." Again, according to Dr. Gupta, some Magistrates render assistance in promoting vaccination and some do not. On protection generally he says that, it is very difficult to vaccinate those who have been inoculated, as such people consider themselves protected for life by this process; that the success or failure of re-vaccination depends on the age of the subject operated on, and the length of interval between the dates of primary vaccination and re-vaccination; successes being generally attained by the latter process in the cases of adults who have been primarily vaccinated during infancy or childhood; the contrary in the cases of children re-vaccinated a few years after primary vaccination; and that in areas in which vaccination is deferred for a year or two for special reasons, such as great prevalence of fever, &c., the number of the unprotected increases by births occuring during the interval. This was the case in thanah Ketugram in Midnapore, which has not been the scene of operations for two years, and which, according to the Civil Surgeon, suffered very severely from small-pox during the year under review. Referring to the degree of protection afforded to the town of Midnapore, the Civil Surgeon says that, on examination he found the proportion of the unprotected to be, of 217 children in 5 schools, 20·7 per cent.—one school in Patna showing 44·1 per cent.—of 58 dispensary patients (examined one morning), 20·7 per cent. (adults 11·1 and children 53 per cent.); and of 1,423 admissions into the Central Jail during the year 3·52 per cent. He estimates that about 20 per cent. of the juvenile, and 3 per cent. of the adult population in the town are unprotected, and that this gives about 3,000 unprotected persons; and taking the birth-rate at 34 per 1,000 per annum, and deducting the casualties at 200 per 1,000, (the supposed death-rate among children) there will, he says, arise 913 fresh subjects for vaccination every year, irrespective of adults. This is the work the one vaccinator sanctioned for the town has to accomplish. He adds that when the standing population have been protected, the practical difficulties in the way of maintaining complete protection of the town will be defective birth registration and scarcity of vaccinifers. With regard to the *Suburbs of Calcutta*, Dr. Gupta affirms that the whole of it, consisting of 14 Police sections, "is well vaccinated, and every year each police section is visited over and over again, and there is no place left unprotected." But the late outbreak of small-pox shows that more protection is required.

While there is no place in the *Hill* portion of the *Darjiling* Circle which remains to be vaccinated, no one place in it can be said to be thoroughly protected, owing to fluctuations of population. In illustration of this, Dr. Wood quotes the case of the Castleton Tea Estate. Here 140 operations were performed in April 1883, and it was pronounced to be perfectly protected;

but in March 1884, 76 fresh unprotected subjects were found. Such instances, he adds, indicate how needful it is to prosecute vaccination actively and constantly in the Hills. The whole of the *Plains* portion of this Circle was overrun by vaccinators by the end of the 1882-83 season, and further protection was afforded to it during the year under review.

The observations in the *Ranchi* Circle have elicited the following results:—In *Lohardugga* the adult population does not take vaccination, and, as far as is known, has never been vaccinated; but that, taking into consideration the infants and children, the well protected thanahs in this district are Ranchi, Choria, Balumat, Lohardugga, Sisoi, Palkot, Biru, Bassia, Torpa, Lodhma and Tamar, and the partially protected thanahs are Sili and Burwya. Similarly a large number of the adult population in *Hazaribagh* is unprotected; but with regard to children, thanahs Dumurhi, Jageswar, Kashmar, Bagodhar, Hazaribagh, Chorpa or Chowparun, Kodarma and Pachamba, with the exception of half (80 villages) of Kharagdiha, are considered thoroughly protected. In *Manbhum*, thanahs Jhalda, Chas, Purulia, Manbazar, Topechanchi, and Nirsha; and in *Singbhum*, Atkooshi, Kalkiapore and Kelaipahari in thanah Ghatsilla; Kerapir, Anandpur and Seranda in thanah Chakaldharpur, and the greater part of thanah Khursua, are believed to be thoroughly protected. The rest of the localities in the above districts have been partially protected.

In the *Sonthal Pergunnahs* Circle almost the whole of the Bhagulpore district is stated to have been thoroughly protected; but this is manifestly incorrect, as there is serious prevalence of small-pox in it at present. In *Monghyr*, thanahs Gogri, Jamui, Chakai and Kharakpur have, with the exception of some villages in each, been completely vaccinated, while thanahs Monghyr and Sultangunge have been partially vaccinated; and the untouched areas are thanahs Surajgurra, Sheikhpura, Secandra, Jamalpore, Beguserai and Tegra. With regard to the Sonthal Pergunnahs district, the Deputy Superintendent states that, "there is no place in the district which is not partially protected, work having been carried on in all the thanahs in the district every year."

In the *Eastern Bengal* Circle the Dacca, Faridpore, Pubna and Mymensing districts, which have been the scene of operations for years, are said to be protected. The partially protected areas are Tipperah and Noakhali, and the untouched areas are Backergunge and Chittagong.

In the *Orissa* Circle, where the opposition offered to vaccination is more obstinate than in any other Circle, no area can be said to have been thoroughly protected. But the places in which vaccination has progressed most are the Cantonment, the towns of Jaipore and Kendrapara and the Sudder, Jaipore, Kendrapara, Salipur, Patamundi, Dharmsala and Banki thanahs in *Cuttack;* the Pipli, Khurda and Bhanpur thanahs in *Poori;* and the Chandbali thanah in *Balasore.* Lesser protection has been afforded to thanahs Aul, Tirtol and Jaggatsingpore in *Cuttack;* to the Sudder and Gop thanahs in Poori; and to the town of Balasore, and the sudder Basta, Jellasore, Bhadrak and Dhamnagar thanas in *Balasore;* but no attention has yet been given to the Bhobanaswar outpost of Khurda and Champagurh outpost of Bhanpur in Poori and to thanahs Soro, Baliapal and Bassudevpore in Balasore.

The report from the *Behar* Circle indicates that, the whole of the Patna district (with the exception of a few villages in each thanah, and the Geriak outpost in thanah Behar); thanahs Motihari and Dhaka in *Chumparun*, excepting a few villages; and about three-fourths of the Arrah thanah in *Shahabad* have been thoroughly protected; that thanah Piru and quarter of thanah Arrah in *Shahabad*, and the remainder of thanahs Motihari and Dhaka in Chumparun have been partially attended to; and that the remaining 10 thanahs in Shahabad and 7 in Chumparun, and the whole of the Durbhanga, Mozufferpore, Sarun and Gya (with the exception of thanah Jehanabad) districts have not been touched.

Summary.

162. The following is a summary of the chief results which attended the operations of the year:—

(1) *That protection was afforded for the first time* by Government vaccinators to the following areas, occupying 6,179 square miles and containing a population of 3,800,888, *vide* marginal table:—In the *Sonthal Pergunnahs* Circle, to thanahs Monghyr,

CIRCLES.	Areas in square miles.	Population.
Sonthal Pergunnahs	1,002	662,129
Eastern Bengal ...	1,719	1,073,992
Behar	3,458	2,064,767

Kharakpore, and Beguserai in the Monghyr district; in the *Eastern Bengal* Circle, to thanahs Brahmanberia, Comillah, Nabinagar, Barakamta, Muradpore, Kasba and Hajigunge in the Tipperah district; in the *Behar* Circle, to thanahs Dhaka, Motihari, Kassarya, Gobindgunge, Bettiah and Bagaha in the Chumparun district; to Arrah and Piru in Shahabad; and to Jehanabad (to a small extent) in Gya.

(2) That the following areas, representing 4,416 square miles and containing a population of 1,916,568, as detailed in the margin, were *for the first time placed under the Licensed system of vaccination*, after they had been traversed by the Government vaccinators:—In the *Darjiling* Circle, thanahs Amur Kasba, Arrarea, Matiari, Kissengunge and Balarampore in Purneah, and thanahs English Bazar, Maldah, Gajol, Gomashtapore, Kaliachack, Shibgunge and Nababgunge in Maldah. Thus, the entire circle, excepting its Hill portion, is now vaccinated by licensed agency. In the *Sonthal Pergunnahs* Circle, thanahs Supul, Kissengunge and Madehpura in Bhagulpore.

CIRCLES.	Areas in square miles.	Population.
Darjiling	2,970	1,219.520
Sonthal Pergunnahs	1,446	697,048

(3) That the areas, in addition to those of former years, which had been *thoroughly protected* at the close of the season 1883-84, comprising 37,969 square miles and containing 15,014,069 inhabitants, as indicated in the margin, were:—In the *Darjiling* Circle, the whole of the Plains portion. In the *Ranchi* Circle, thanahs Jhalda, Chas, Purulia, Manbazar, Topechanchi and Nirsha in the Manbhum district, and Atkooshi, Kalkiapur, and Kaliapahari in thanah Ghatsilla, Kerapir, Anandpur and Seranda in thanah Chakaldharpore, and the greater part of thanah Khursua in the Singbhum district. It is also stated that, excluding the adult portion of the population in the Lohardugga and Hazaribagh districts, who will not accept of vaccination, and who, as far as is known, has never been vaccinated, the infants and children in thanahs Ranchi, Choria, Balumat, Lohardugga, Sisoi, Palkot, Biru, Bassia, Torpa, Lodhma and Tamar in the former district, and in thanahs Dumurhi, Jageswar, Kashmar, Bagodhar, Hazaribagh, Chorpa, Kodarma and Pachamba with the exception of half of Kharagdiha, in the latter, have been thoroughly protected. In the *Sonthal Pergunnahs* Circle almost the whole of the Sonthal Pergunnahs and Bhagulpore districts; and thanahs Gogri, Jamui, Chakai and Kharakpore in the Monghyr district, with the exception of some villages in each. The statements of protection in this Circle must be accepted, I regret, in a very modified degree, as small-pox has abundantly shown itself in this area. In the *Eastern Bengal* Circle, Dacca, Faridpore and Mymensing. In the *Behar* Circle, the whole of the Patna district, with the exception of a few villages in each thanah, and thanahs Motihari Dhaka in Chumparun, also excepting a few villages.

CIRCLES.	Areas in square miles.	Population.
Darjiling	271	63.241
Ranchi	13,764	2,318,717
Sonthal Pergunnahs	9,880	3,644,165
Eastern Bengal ...	11,351	6,800,050
Behar	2,703	2,187,596

Source and character of Lymph employed.

163. The arrangements under this head were the same as in the preceding year, except that in addition to humanized, bovine lymph was also pretty generally used. Particulars relating to the latter virus are given in the next paragraph. In *Calcutta*, as anticipated, the animal vaccination depôts greatly lessened the difficulty experienced regarding the supply of virus in the southern division of the town, but in the northern division, where very few people resort to animal vaccination, the difficulty is still very great, especially in the latter part of the season, when the demand for private vaccination is very large. In the *Metropolitan* Circles the usual difficulty of obtaining subjects to serve

as vaccinifers was experienced, particularly in Bankura and Midnapore where the people hold that the vaccinifer generally dies after parting with the virus. Attempts to propagate lymph taken from children resulted in resistance, amounting to assault, in more than one village. Refering to this resistance, the Civil Surgeon of Midnapore offers the following observations:—"The question of the continuous supply of lymph for municipal vaccination is likely eventually to become a serious one, owing to the gradual extinction of unprotected material, and the general aversion the natives have to give their children as vaccinifers. At present the vaccinator is able to meet the demand by making use of the children of Sonthals or other junglees whose parents have no such objection, and who are allowed a small money-reward for the service; but this supply is limited, and will soon cease. Tube lymph cannot be depended on, and its supply would be insufficient. A bovine establishment would of course meet the difficulty, but its cost would, I fear, be prohibitive. A sufficient and continuous supply of lymph would be secured if Government could be induced to make it compulsory for all receivers of gratuitous vaccination to give their children as vaccinifers when required. There would be no hardship in this; the feeling against it is not in any way connected with caste, but is due to selfishness and ignorance: the only objection ever raised is the absurd one that the taking of lymph weakens the child. The unwilling could still have the option of escaping the rule by paying the prescribed fee of four annas. I think it is only fair for the municipality to demand that when they give vaccination gratis to all comers, the recipient should be under the obligation of assisting in the extension of the benefit to the other members of the community." Notions, similar to those mentioned above, are also prevalent in the *Ranchi* Circle. The low castes in some parts, however, took vaccination by the arm to arm process, but crusts had to be employed in the cases of the high castes. In the *Orissa* Circle also this process is stoutly resisted by the orthodox Hindus and the ignorant. In one case a Telee (oilman) severely assaulted a vaccinator while he was taking the virus from the arm of a child. He was prosecuted and sentenced on conviction to six weeks' rigorous imprisonment. Owing to this resistance, rewards had to be offered to the poorer classes to allow their children to be employed as vaccinifers, and recourse was also had to the prisoners in the Poori Jail, and those measures were attended with success. In the *Behar* Circle, crusts had to be employed in some cases when similar resistance was offered.

This Office attended to 90 requests for virus from the Municipalities, Dispensaries, &c., which involved 155 supplies of humanised lymph in 1,271 tubes and 299 crusts, 273 supplies of bovine lymph in 2,015 tubes, and four supplies of English lumph in 20 tubes. The figures of the preceding year are 61 applications, 256 supplies, 1,816 tubes of lymph and 410 crusts. Of the requests for virus a good many came from distant places, such as Indore, Jodhpore, Jeypore, Khettri, Nepal, Port Blair, Bhopawar, Jeddeh, Rajpootana, Delhi, Malwa, &c. In addition, requisitions from Messrs. Bathgate & Co. and Messrs. Smith Stanistreet & Co., chemists and druggists in Calcutta, and from some of the Shipping in the Calcutta Port were also attended to.

164. Bovine lymph was very largely experimented upon during the year under review in Calcutta (the head-quarters of the scheme), and in all the Vaccination circles. To the latter, excepting the Metropolitan circles, the virus was sent from this office. With the same view several Municipalities were also supplied with it, but not to so great an extent.

Bovine Lymph—employment and value of—

165. The subjoined table exhibits at one view the results of the experiment in the above-mentioned areas, excepting the Municipalities, as the operations in them were carried on, with few exceptions, by the Municipal vaccinators, who are unused to manipulate with bovine lymph, and on too limited a scale, and do not, therefore, possess any practical value. Moreover, the details furnished by some of them are defective and incomplete, chiefly because the numbers of several operations prono unced successful, or failures, have not been furnished:—

Number of Operations performed, with results.

	Circles.	Total number vaccinated.	Primary.		Re-vaccination.		Percentages of successful cases to total vaccinated.	
			Number vaccinated.	Number successfully vaccinated.	Number re-vaccinated.	Number successfully re-vaccinated.	Primary.	Re-vaccination.

By arm to arm transmission of Bovine virus.	Sonthal Pergunnahs Circle	11,024	11,024	10,993	......	......	99·71	......
	Eastern Bengal ,, ...	16,679	16,679	16,678	......	......	99·92	......
	Total ..	27,703	27,703	27,671	......	......	99 88	......

The above table demonstrates that of 1,073 primary operations performed in Calcutta and the Southal Pergunnahs circle with lymph taken *direct from the calf*, 983, or 91·61 per cent., proved successful; that of 1,111 operations conducted in the Vaccination circles with lymph *stored in tubes*, 899, or 80·91 per cent., terminated in success; and that 27,671 successes, or at the rate of 99·88 per cent., attended 27,703 vaccinations undertaken in two Vaccination circles with bovine lymph *maintained by the arm to arm process.* These data indicate—

(1). That the results attained by vaccinating with lymph taken *direct from the calf* are, making allowance for the fact that the number of persons vaccinated at the Central depôt in Calcutta does not include 880 who left Calcutta before the results of the operations on them could be ascertained, satisfactory, and in no way inferior to that generally obtained by the employment of humanized lymph.

(2). That while the results achieved by the use of lymph *stored in tubes* were satisfactory in some of the Vaccination circles in which it was experimented upon, a decided opinion on the value of this virus for conducting vaccinations in comparison with that of humanized lymph, similarly stored, cannot be pronounced this year, owing to the facts that in some cases the conduct of the operations was entrusted to vaccinators unaccustomed to manipulate with bovine lymph, and that they were carried on on a somewhat limited scale, especially in Darjiling and Behar, where the most signal failures took place. I believe, however, that with greater care in selecting and storing this lymph, in order to protect it from the deterioration, hereinafter described, during transit, its operative power will compare favourably with that of humanized lymph.

(3). That the results realized by operating with bovine virus *maintained by the arm to arm process* is quite satisfactory and identical with those generally achieved by vaccinating with humanized virus transmitted by the same process.

Turning now to the consideration of the value of bovine in comparison with humanized lymph, and of the causes of non-success in the employment of the former where such occurred, we have the opinions on these points of Dr. Gupta, the Superintendent of the scheme at its head-quarters, and of the several Superintendents of Vaccination in whose Circles, and the Civil Medical Officers in whose Municipalities, the experiments were made. Dr. Gupta's report (the second on the subject), which will be found in Appendix V, possesses a special value, from the facts that the operations were conducted in Calcutta on a more thoroughly organized and systematic manner than in the mofussil, and that he has watched them with

great attention, being more interested in the question than others. His opinions and conclusions on the above points, and a summary of those of the other Superintendents of Vaccination and of the Medical Officers, are subjoined.

Dr. Gupta writes:—"Whenever lymph direct from the calf was used, success was certain: so with good lymph in tubes and used by skilful operators. In cases of failure, the causes of non-success were the mixture of serum, blood and other impurities. In such the lymph is generally coagulated and comes out like a thread from the tube. That the bovine lymph seems more potent appears from the following facts: The fever is stronger and sets in earlier. The swellings and irritation of lymphatic glands are always greater, and, sometimes, where humanized virus had failed, bovine lymph has succeeded. (*see* his report for instances). In the districts the inspectors and vaccinators (in his circle) remarked that the virus was stronger and never degenerated and died out as in former years. In persons who were inoculated during childhood, the bovine lymph has been successful. In re-vaccination cases with calf lymph the percentage of success is much higher than with humanized lymph. Bovine lymph possesses another great advantage over humanized virus, viz., that we always have a plentiful supply whereby we can meet any sudden demand."

The collective opinions of the rest of the Superintendents, excepting of Darjiling and of some of the Civil Surgeons, indicate—(1) that the vesicles raised with this lymph were characteristic and satisfactory, typical, or wholly or almost identical with those obtained from humanized lymph, and that they ran their course in the usual time; (2) that the areola was well developed and attended with less irritation, inflammation or constitutional disturbances; (3) that the operations were not followed by more than the ordinary secondary fever, or by abscesses, sores or ulcers; (4) that by transmission by the arm to arm process, perfect vesicles with well-developed areolas were obtained; and, finally, that, on the whole, satisfactory success has attended the operations with bovine lymph, and that as a protective agent it is not inferior to humanized lymph. On the other hand, some of the Civil Surgeons, who, however, form the minority, have submitted adverse opinions—in some cases unsupported by any definite reason. Their observations point to the following, viz., (1) that the vesicles obtained are rather small, weak and without much areola, and that the course and development of the former are more retarded, the areola being formed on the 10th day; (2) that the fever is high; (3) that the difficulty of preserving and transmitting the lymph is great; (4) that it does not retain its activity in tubes, and that in the hot weather it is inert; and (5) that generally it is unreliable as compared with humanized lymph.

The chief causes of failure are reported to be deterioration of the lymph when transmitted in tubes owing to heat, admixture of air, or inspissation, when it is rendered inoperative.

Calcutta.—Dr. K. McLeod.—*Opinion.*—The results have not been uniformly good. At times the vesicles were very typical and almost identical with those obtained with humanized lymph. Frequently they were found to be small and weak, and there occurred failures occasionally.

Darjiling Vaccination Circle.—Dr. J. J. Wood.—*Operation.*—All the operations performed by the subordinates proved successful. Dr. Wood did not succeed in his cases. *Cause of failure.*—Dr. Wood states that, examined under the microscope, the first supply of lymph sent to him was found to contain what to all appearance was a plethora of red blood—corpuscles—probably bovine blood.

Ranchi Circle.—Dr. W. Owen.—*Operations.*—Of the operations on 74 children, 70, or 94·59 per cent., proved successful. From this source arm-to-arm vaccination was carried out. The latter operations are said to have been successful, but the figures in support of the observation have not been furnished. The Civil Surgeon of Ranchi was also supplied with this lymph. It proved successful in his hands, and he asked for a further supply. *Opinion.*—Cases of non-success were fewer than with humanized lymph, and the employment of the virus was less likely to be followed by abscesses, or sores, or ulcers, or eruptions.

Sonthal Pergunnahs Circle.—Dr. Barker.—*Operations.*—In this circle operations were carried on with lymph taken direct from the calf and also from lymph in tubes locally stored. The first calf, a vaccinated one, was taken

from Calcutta, and 20 others were vaccinated locally. Much difficulty was experienced in the Dumka Sudder station in inducing the people to accept of vaccination direct from the calf. Nevertheless, the 92 operations which were conducted with lymph taken directly from the calf, in the presence or under the supervision of Dr. Barker, proved successful. Operations were also carried on in the Dumka and Deoghur sub-divisions by a painstaking Inspector and a Mahomedan vaccinator, who also shaved and operated on the calves, as the Hindu vaccinators exhibited a disinclination to perform this work. In these areas 56 persons were vaccinated with lymph taken direct from the calf, 47, or 83·92 per cent., successfully, and 11,024 operations were performed by the arm-to-arm transmission of the lymph, and of this number 10,993 proved successful, or at 99·71 per cent. Lymph in tubes was also supplied to the Civil Surgeon of Monghyr, and all the 99 operations performed by him with it proved successsul. *Opinion.*—The Deputy Superintendent of this circle notes, with regard to the character of the vesicles that, "the base of the 'areola' is more wide and the marks more deep in vaccinations performed with bovine lymph than in those performed with humanized lymph."

Eastern Bengal Circle.—Mr. Lyons.—*Operations.*—In this circle lymph from tube was employed on 33 subjects, and was attended with 31 successes, or at the rate of 93·93 per cent. After this 16,679 operations were performed with virus transmitted by arm to arm. Of this number 16,678 proved successful, or at 99 92 per cent. *Causes of failure.*—Some of the tubes sent to this circle could not be used owing to inspissation of the virus within them. Mr. Lyons suggests that the diameter of the tubes be increased. *Opinion.*—Less irritation and constitutional disturbance follow the use of bovine lymph.

Orissa Circle.—Mr. P. Veariah Naidu.—*Operations.*—In this circle 513 persons were vaccinated, 421, or at 82·06 per cent, successfully. *Opinion.*—Mr. Naidu states that the vesicles obtained by the employment of bovine lymph were larger, more characteristic, and, on the whole, more satisfactory than those ordinarily obtained by humanized lymph.

Behar Circle.—Assistant Surgeon Mothuranath Sen.—*Operations.*—In this circle 20 operations were performed, of which only 8, or 40 per cent., proved successful. *Opinion.*—On the merits of the lymph, the Assistant Surgeon writes:—"The course and development of vesicles were rather retarded in all the cases operated on. The areola was formed on the tenth day, and the fever was high. The vesicles in all the cases were typical. After the first transmission, the vesicle took a regular course. I have seen the results of six cases, and it appears to me that it is better than the humanized lymph which is used here."

Soori Town.—Dr. G. C. Roy.—*Operations.*—Here 10 operations were performed, attended with only two successes. The vesicles were slow in their courses, being on the seventh day as large as would be observed on the fifth day of vaccination. There was no increased inflammation or fever, and the vesicles ran through their course in the usual time. *Causes of failure.*—The difficulty of preservation is the great drawback, the large number of failures being evidently due to this cause; and as the people judge of the success by the immediate result of the operation, it is feared that bovine lymph in tubes will never find favour with the mofussilites. *Opinion.*—With regard to the nature of protection, inflammation, and secondary fever, bovine lymph seems to be superior to humanized lymph.

Midnapore Town.—Dr. A. Tomes.—*Operations.*—Of the 34 operations with bovine lymph only 7, or 20·5 per cent., proved successful, while in 15 persons vaccinated with humanized lymph 7, or 40·6 per cent., of successes were obtained. The latter virus was used in the hot weather in March, and the former during the cold weather. *Opinion.*—Considers that these facts illustrate the unreliable nature of bovine as compared with humanized lymph when transmitted in tubes.

Berhampore Town—Dr. S. M. Shircore.—*Operations.*—Here 18 operations were performed with 17 successes. *Opinion.*—After this large number of successful results, the Civil Surgeon states that, humanized lymph cannot for "obvious reasons" be compared with bovine lymph in value.

Comillah Town.—Dr. E. G. Russell.—*Operations.*—Eleven persons were vaccinated, 7, or 63·63 per cent. successfully. No opinion has been offered.

Arrah Town.—Dr. J. O'Brien.—*Operations.*—Not furnished. *Opinion.*—Reports that vaccination was commenced with bovine lymph and then continued by arm to arm transmission, and proved highly successful; that a considerable number of the tubes failed, but that those which proved successful produced perfect vesicles, although rather small and without much areola; and that vaccination from these cases subsequently produced most perfect vesicles with well developed areola, and was most satisfactory in every respect.

Gya Town.—Dr. R. McLeod.—*Operations.*—In 43 operations with bovine lymph, 35, or 81·39 per cent., proved successful, while with humanized lymph 73 cases were attended with 52, or 71·23 per cent., successes. *Opinion.*—Considers that, as the success with the former was considerably greater than that with the latter lymph, the superiority of bovine lymph is clearly established; but adds that the operations conducted with this lymph in June proved altogether unsuccessful.

Durbhunga Town.—Dr. W. A. Gilligan.—*Operations.*—Not furnished. *Opinion.*— Reports that bovine lymph was a grand failure. "I tried it over and over again as supplies frequently arrived from Calcutta upon Indian and English children, and as all the operations were done in my presence, I have no fault to find with the method, yet I never saw a single satisfactory result. I mentioned this fact to the Sanitary Commissioner upon his visit, and he suggested the heating and liquifying of the virus in the tubes, before inoculating; but after having done so, I have had no successful result. So far as my experience with this bovine lymph is concerned, I must, after patient trial of it, say that I regard it as very unreliable compared with ordinary humanized material."

Chuprah Town.—Dr. C. Russel.—*Operations.*—No figures furnished, but all the operations are said to have been failures. *Opinion.*—The Civil Surgeon is not inclined to think favourably of bovine in comparison with humanized lymph, although it would be wrong, he says, to condemn it on such a limited trial, as many causes may have combined to render it inert. He sees no reason why, since this lymph is held in high repute in England, it should not answer admirably here, provided due care is exercised in its selection and storage.

Bettiah Town.—Dr. E. Bovill.—*Operations.*—Twenty operations were performed which are alleged to have been attended with only five successes; but it appears that the native vacciniator who performed the operation did not bring to the notice of the Civil Surgeon the successful cases. Only one case was seen by Civil Surgeon in which there was some approach to success on the ninth day with retarded eruption, one vesicle only having formed. He himself operated on two children and two young men, all unsuccessfully. *Causes of failure.*—The failures are said to be probably due to the lymph not being fresh and to have got heated in transit. *Opinion.*—The Civil Surgeon says that calf lymph, though it retains its activity for a long period for the calf, rapidly deteriorates when used for human vaccination. Noticing that the lymph was particularly clear, he remarks that clear lymph is not so active as when it is somewhat turbid, the small coagula and deposits causing the turbidity, being the most active part of the lymph. It was also fluid, while fresh lymph filled direct into the tube from the vesicle usually coagulates in the tube, and requires to be loosened by passing a horse hair through the tube before it can be blown out. Every care was taken by the Civil Surgeon in performing the operations: he is therefore constrained to believe that the lymph was not in an active condition.

Monghyr Town.—Dr. J. H. Thornton.—*Operations.*—No figures have been furnished. It is, however, stated that the two first supplies all proved successful; but not so all subsequent ones. This was, however, considered of no consequence, as after the operations with the first supplies, arm to arm vaccination was carried on. The Civil Surgeon is unable to account for the failure of the last supplies. Some of the vaccinations with these supplies were performed by the Civil Surgeon himself on European children and adults, but they all failed. He can only suppose that some cause with which he is unaquainted, had rendered the lymph inoperative. But, it is said in the report of

the Superintendent of Vaccination, Sonthal Pergunnahs Circle, that tube lymph was supplied to this officer, and that all the operations with it proved successful.

Maldah Town.—Assistant Surgeon G. C. Chatterjee.—*Operations.*—Here 40 vaccinations were performed, 26, or at 65 per cent., successfully. *Opinion.*—The Assistant Surgeon cannot as yet form an opinion on the subject.

Cuttack Town and Cantonment.—Dr. Stewart.—*Operations.*—Thirteen operations were performed here with seven successes, or at the rate of 53·84 per cent. *Causes of failure.*—The Civil Surgeon believes that the use of lymph from tubes is always attended with a certain amount of uncertainty as to success. It is liable to deterioration like other lymph from heat, admixture of air, or other causes. *Opinion.*—The Civil Surgeon notes that the vesicles that did take were of a characteristic and of a satisfactory nature; and that from the little experience he has had, he is of opinion that this lymph is more reliable and effective than ordinary humanized lymph, but that more extended experience as to its nature and results is necessary.

Puri Town.—Dr. B. Gupta.—*Operations.*—The seven cases in which this lymph was tried here proved failures. *Opinion.*—The Civil Surgeon does not think this failure to be remarkable, or to detract from the value of the lymph as a protective agent, as humanized lymph has similarly failed when secured in tubes and sent from Calcutta. He is of opinion that success would no doubt be attained if the lymph could be had sufficiently fresh.

Chyebassa Town.—Dr. S. J. Manook.—*Operations.*—Forty-six vaccinations were performed in this town, 24 by the Civil Surgeon and 22 by his medical subordinates. Of the Civil Surgeon's operations 16, or 66·66 per cent. were successful, and of his subordinates' operations 9, or 40·9 per cent. *Opinion.*—From the above facts the Civil Surgeon concludes that bovine cannot claim any superiority over humanized lymph.

Further observations and suggestions by Dr. Gupta.

166. There are some points in Dr. Gupta's report which should be noticed here: first, that it is very satisfactory to find that vaccination with bovine lymph is now greatly appreciated, demands for it being very large, so much so that the establishment was barely able to cope with them; secondly, that it is observable that the applicants for vaccination belong mostly to the Christian community (both ladies and gentlemen), and that the natives are in the minority, the proportion of operations among the former being 67·47 per cent. of the total vaccinated and among the latter only 32·53 per cent; thirdly, that a fee should be charged in cases where the calf is carried for vaccination to the houses of private residents, as the demand for home vaccination is increasing considerably, the calls of this nature having amounted to 1,352 during the year under review, to meet which the energy of the establishment is greatly taxed, and some expenditure incurred. On this point Dr. Gupta says:—"It is but right that a small fee should be charged to those who wish to be vaccinated at home. The Compulsory Act (Vaccination) provides a fee for 'home vaccination,' and I do not see any reason for offering gratuitous vaccination with calf lymph, while we charge fees for vaccinating with humanized virus, and thereby putting the latter under a disadvantage." I quite coincide with these observations. Finally, that it is time now that the Bovine Vaccination Scheme should be made a permanent institution. The arrangements secure a supply of virus sufficient to meet all demands, particularly emergent ones. It is for the latter description of cases that the utility of bovine predominates over that of humanized virus, as the former can be made available at all times, but not the latter. It will be seen from that officer's report (Appendix V) that several emergent demands for vaccination were made and promptly attended to during the year under review.

WORK OF THE YEAR.

Total number of Operations performed.

In the Vaccination Circles.

167. Before noticing the results of the year, as set forth in the subjoined table, it should be mentioned, first, that the figures of the Suburbs of Calcutta include the vaccinations at the Inland Emigration Cooly Depôts for only six months—April to June and January to March—the returns of the intervening months not having been furnished, owing to Dr. Gupta having given up the supervision of

vaccinations in the depôts, repudiating all responsibility in the matter, without consulting this office, for reasons reported to Government in this office letter No. 946, dated the 18th February 1884; and, secondly, that, as in the preceding year, 32 returns were received from vaccinators by the Superintendent of the Eastern Bengal Vaccination Circle after his annual statements had been closed, necessitating their omission from the results of this year, to be included in those for the next year:—

CIRCLES.	TOTAL NUMBER OF VACCINATIONS PERFORMED.		DIFFERENCE IN 1883-84.	
	* In 1883-84.	In 1882-83.	Increase.	Decrease.

GRAND TOTAL ...	1,361,332	1,261,425	99,907	......

* Inclusive of 10,780 Repetition cases in the Vaccination Circles and 139 in the Municipal Area, aggregating 10,919.

The number of vaccinations performed during the year under review amounted to 1,361,332, against 1,261,425 in the preceding year, to which the *Vaccination circles* contributed 1,284,467 operations, against 1,202,321, and the *Municipalities, Dispensaries*, &c., 76,865, against 59,104, indicating a very satisfactory increase in the numbers vaccinated in both areas, viz. to the extent of 82,146 in the *Vaccination circles*, and 17,761 in the *Municipal area*, culminating in a total increase of 99,907 operations. Considered individually, we have on the side of advancement the Eastern Bengal, Ranchi, Behar and Orissa circles in the order named, and on the side of retrogression the Darjiling, Sonthal Pergunnahs, Metropolitan and Calcutta circles, also in the order mentioned. The retrogression was due, as explained by the respective Superintendents in charge of the circles exhibiting them, to the following causes. In *Calcutta*, to the establishment of the depôt for animal vaccination, where 2,538 persons were operated on, who otherwise would have taken vaccination at the hands of the Calcutta vaccinators. The Superintendent of the *Metropolitan* Circles says: "The causes of the decrease are not far to seek. A bad harvest kept back many from accepting vaccination, as they would not be able to pay the fee." The diminution in work in the *Suburbs* of *Calcutta* has already been accounted for. The reduction of work in the *Darjiling* Circle was referred to the change from Government to Licensed agency operations in Maldah and Purneah, the Government agency on the Hills having returned an excess of 6,929 operations. It is also attributed to the difficulty of securing subjects to serve as vaccinifers which prevented the more vigorous pushing on of operations in Bogra, Rajshahye and Rungpore; and, to some extent, to opposition to vaccination offered in the two first-named districts. The Deputy Superintendent of the *Sonthal Pergunnahs* Circle submits the following reasons as accounting for the falling off in the work of the year:—(1) Great opposition to vaccination met with in suppressing an outbreak of small-pox in thanas Sultangunge, Kolgong, Bhagulpore and Nowada, particularly in the first-named thana; (2) considerable difficulty of the same kind having to be combated with in the Monghyr district, where much new ground had been taken up for operations; (3) non-receipt of returns from many of the licensed vaccinators who worked in Deoghur and Dumka. The last statement is considered by the Superintendent of the Circle to be misleading, as the returns of only a few operations were not received, and as this, as a rule, occurs every year. His own opinion is that the decrease is traceable to increased area travelled over; to decrease of subjects for vaccination, particularly as much distress prevailed owing to failure of crops; to some vaccinators working independently of the department, who kept no registers and

submitted no returns; to the comparative freedom of the circle from small-pox; and to the indifference of the people.

168 The following table indicates which Municipalities, &c., exhibited improvement in vaccinations in comparison with the preceding year, and which exhibited decreases of operations:—

The pleas furnished in previous reports as having caused retrogression in the progress of vaccination in these instiution were also advanced this year. They need not, therefore, be recapitulated. On the other hand, the great improvement in vaccination, disclosed by the above table, is attributed, chiefly, to more than usual care and attention having been bestowed by the Civil Surgeons generally, and by some of the Assistant Surgeons and Civil Hospital Assistants, in inspecting the work of the vaccinators, and to the more systemized and active manner in which work was carried on under the provisions of the Compulsory Vaccination Act, which, it will be seen from a subsequent portion of this section of the Report, was extended during the year to a large number of the Municipalities.

169. *Primary and Secondary Operations.*

Coincident with the advance in total vaccinations, there was an increase in primary vaccinations, the increment being represented by 84,954 operations in the Vaccination circles and 18,288 in the Municipal area, aggregating

103,242 operations. There was diminution in the number of secondary operations to the extent of 3,335. The decrement is chiefly seen to have occurred in Calcutta and in the Suburbs of Calcutta, traceable in the former area to the expansion of the bovine vaccine scheme relieving the humanized vaccine system of many operations of this class, and in the latter to the absence of the records of operations in the Cooly Depôts for six months, for reasons submitted in a previous paragraph of this Report.

170. *Rates of success in Primary and Secondary Operations.*

	Number of Successful Vaccinations.				Ratio per cent. of Successful Cases.

Municipalities, Dispensaries, &c. ...	66,953	1,104	50,132	1,730	94·60	56·67	92·77	69·70
Grand Total ...	1,324,853	4,975	1,223,561	5,497	98·60	49·42	98·60	45·12

The operations, of which the results were unknown, and which, therefore, are not included in the above table, amounted to 3,743 in the Vaccination Circles and 4,049 in the Municipal area, aggregating 7,792.

From this table we find that a higher standard of success was returned by the Calcutta, Metropolitan, Darjiling, Sonthal Pergunnahs and Eastern Bengal Circles than by the Ranchi, Behar and Orissa Circles. In the last-named circle the rate of success exhibits considerable improvement on that of the preceding year. Ranchi stands lowest in ratio of success in primary cases. The Civil Surgeon of Pubna remarks that the percentage of success in the Eastern Bengal Circle is overstated, as, from an examination of some 60 cases, he is of opinion that about only 85 to 90 per cent. of the operations in this circle could have been successful. An improvement in this direction is also seen in the total primary vaccinations in the Municipal area, but the rate of success is inferior, the depreciation having been influenced by the returns from the institutions situated in the districts named below. The extent of reduction of success is noted opposite each:—

Districts.	Number of Municipalities, &c.	Decrease in percentages of success.	Districts.	Number of Municipalities, &c.	Decrease in percentages of success.
Singbhum ...	1	19·42	Rajshahye ...	1	2·48
Hazaribagh ...	1	16·34	Maldah ...	2	1·09
Chittagong ...	7	15·11	Manbhum ...	2	·91
Midnapore ...	1	8·21	24-Pergunnahs ...	10	·90
Poori ...	1	6·67	Nuddea ...	9	·38
Hughli ...	4	5·29	Tipperah ...	6	·37
Sarun ...	6	3·13	Burdwan ...	5	·26
Cuttack ...	4	2·68	Howrah ...	1	·22

Depressed success in the above-mentioned Vaccination circles and Municipal areas vitiated the combined general result of the entire area under operation. The rates of success in re-vaccinations are generally unreliable, and this, I believe, arises from imperfect knowledge of their condition on the part of persons operated on; and from the vaccinators depending on their statements and omitting to examine the subjects properly.

171. *Average number of operations performed by each vaccinator.*

Grand Total ...	1,501	1,287	907	980	......	73

The figures in the above table indicate increased energy on the part of the vaccinators of the Orissa, Calcutta, Behar, Eastern Bengal, Ranchi and Darjiling Circles, against a decline in the work of the operators in the Sonthal Pergunnahs and Metropolitan Circles, in the order mentioned. The improvement in *Calcutta* and in *Darjiling* was effected by a reduced number of operators, in the latter circle their number being considerably lower. In *Orissa* an almost equal strength of operators produced an improvement which is comparatively the greatest. To these men, as well as to their supervising officers, great credit is due. On the other hand, a larger staff of operators in the *Metropolitan Circles* and an equal one in the Sonthal Pergunnahs Circles produced considerably reduced work as credited to each man. The falling off in these circles had the effect of causing a diminution of 27 operations per man in all the Vaccination circles.

The marginal summary, taken from the above table, indicates that the work performed by the Licensed agency was considerably better than that performed by the Government Agency in every respect, except that, gauged by the number of operations performed by each of them, the licensed vaccinators exhibited less energy in pursuing their work than the Government men.

This table indicates that of the 1,275,697 primary operations in the Vaccination circles, 13 08 per cent. were performed on infants under one year, 65·70 on children between one and under six, and 20·11 on children above six years and adults, demonstrating, again, that children between one and under six years are the most largely protected, and infants below one the least. This feature is presented by all the Vaccination circles, except Calcutta, Darjiling and Ranchi, where infants received greater protection than the adults. The general results of the Municipal area accord with those which are common to the majority of the Vaccination circles. Apart from several other causes, the main reason why a larger ratio of protection is seen among children above one and under six years of age than among infants, is that, parents or guardians (particularly mothers) greatly fear to expose children of tender age to vaccination, which is considered to be attended with much risk In Municipal towns, or other areas, where the Compulsory Vaccination Act is in force, a limit of 12 months is fixed under its provisions, within which parents or guardians cannot be compelled to present their children for vaccination. We may be sure that full advantage is taken of the latitude allowed by the law. In comparison with the results of the preceding year, a small improvement is seen in the percentage of infants vaccinated; and as the results of 1882-83 were in advance of those of its predecessor, the improvement may be considered to be progressive. To this improvement all the circles contributed, excepting Orissa, where there was a considerable falling off, and Metropolitan, Behar and Eastern Bengal, where there was hardly any progress.

174. *Vaccination according to Sex.*

Of the sexes vaccinated, as set forth in the above table, the males exceed the females as in former, years, in the Vaccination circles, whether considered numerically (664,704 against 619,763), or in proportionate relationship with the total vaccinations of the year (51·74 against 48·25 per cent.), or with the sexual populations (2·88 against 2·68 per cent). The figures of each of the Vaccination circles (excepting Behar, which exhibits a preponderance of females vaccinated) as well as of the Municipal area, disclose the same features. Both the males and females, were best protected in the Suburbs of Calcutta, and in the next degree in the Eastern Bengal, Ranchi and Orissa Circles, as well as in the Municipal area. Contrasted with the preceding year, increase in the proportions of both the male and female populations protected is returned by the Orissa, Eastern Bengal, Behar and Metropolitan circles, notably by the first-named circle, and decreases by the other circles, Ranchi conspicuously. These increments and decrements culminated in a decline in the proportions protected of both the male and female populations in the whole area under operation.

The figures in the above table disclose that, calculated on the *gross numbers vaccinated*, the largest proportion of the operations were performed on the Hindus, next on Mahomedans, third on those classed under the head of "Other races," and least on Christians, both in the Vaccination circles and in the Municipal area. Examining the returns of each circle, the above order is departed from in Calcutta, where more Christians than "Other races" were operated on; in the Darjiling and Eastern Bengal Circles, where the operations on the Mahomedans exceeded those on the Hindus, and in the Sonthal Pergunnahs, where the operations on the "Other races" preponderated over those on the Mahomedans. Relatively to *populations* operated on, the greatest protection was afforded to those recorded under the head of "Other races" next to Mahomedans, then to Christians, and least to Hindus in the Vaccination circles; but in the Municipal area the Christian population was protected at a considerably higher rate than the Hindu. Taken individually, the protection varies in each from that afforded to all the circles combined: thus, in Calcutta, the Metropolitan and Orissa Circles, the Christians received most protection, and the Hindus and Mahomedans in the two first-named circles at an almost equal rate; in the Ranchi circle the Hindus were best protected; in the Sonthal Pergunnahs the Christians received better protection than the Hindus and Mahomedans; and in the Eastern Bengal and Behar the Christians were least attended to, while in the former circle, as well as in the Darjiling circle, the protection afforded to those coming under the head "Other races" was very considerably greater than that to the other nationalities in those circles. In comparison with the results of

the preceding year, we have, during the year under review, in the Vaccination circles considered as a whole, on the side of better protection the Mahomedans and the Christians, and on the reverse side the Hindus and the "Other races," in relation both to the *total numbers vaccinated* and to the proportions calculated on the *populations*.

From the above table we learn that the vaccinators have not yet been able to reach the most effective age for vaccination, viz., infancy, for the figures show that of the 1,448,805 births, estimated at the low rate of 30 per 1,000 of the population within the vaccination area, only 12·32 per cent. of infants, exclusive of those who died, were successfully vaccinated; thus leaving the large proportion of 78·97 per cent. of infants unprotected. This defect is seen to obtain in every Circle as well as in the Municipal area, for nowhere has the birth-rate been overtaken by the infant vaccination ratio. In comparison with the results of the preceding year, improvement in this respect was, however, effected in the Sonthal Pergunnahs, Orissa, Suburbs of Calcutta, Eastern Bengal, Calcutta and Behar Circles, which returned excess percentages of infantile vaccinations of 2·28, 1·47, 1·13, ·92, ·67, and ·65, the progress in the first named circle being the greatest. The Municipal area also shows an advancement, as it exhibits an increase in infant vaccination of 1·42 per cent. in comparison with the ratio of 1882-83.

Calculated on the births *actually recorded* in Calcutta and its Suburbs—8,719 and 5,274 respectively—it is found that, deducting the numbers who died, the proportions of the infants protected and unprotected amount in Calcutta to 29·71 and 43·03 per cent. respectively, and in the Suburbs to 28·70 and 39·19 per cent. respectively, on the total numbers available for operation.

Inspections.

177. The degree of supervision exercised by the inspecting officers over the work of the vaccinating staff, and the relative merits of inspections made by them, will be gathered from the figures in the subjoined table :—

* The Deputy Superintendent visited 357 and the Superintending vaccinators 522 paras and bustis.

This table discloses the following results:—

(*a*)—That 2,579 villages were inspected by the Superintendents of Vaccination, against 3,177 in the preceding year; 3,576 by the Deputy Superintendents, against 4,082; and 19,400 by the Superintending vaccinators, against 20,015, indicating a diminution in the work of all these officers to the extent of 598 inspections by the Superintendents, 506 by the Deputy Superintendents, and 615 by the Superintending vaccinators.

(*b*).—That individually considered, the officers marginally indicated returned, in comparison with their work in 1882-83, a smaller number of villages inspected during the year under review. The extent of retrogression is noted in each case.

(*d*).—That scrutinizing the figures demonstrating the relative merits of the inspection work performed by the different officers in relation to the inspection of the numbers vacci-

nated, it is found that, on the whole, the Superintendents inspected 8·78 per cent. of the number vaccinated during the year, against 7·79 per cent. in the preceding year; the Deputy Superintendents 11·84, against 14·72 per cent; and the Superintending vaccinators 52·01, against 55·85 per cent., indicating an improvement in the work of the Superintendents, against a falling off in those of the Deputy Superintendents and Superintending vaccinators, particularly of the latter. On the whole the outturn of this work is not satisfactory. Looking into each officer's work, it is seen that the largest numbers of inspections, as represented by the percentages of inspections of total numbers vaccinated, were made by the—

The figures indicate that creditable progress was made in inspection work by the Superintendents of the Eastern Bengal, Orissa and Ranchi; by the Deputy Superintendent of the Sonthal Pergunnahs Circle; and by the Superintending vaccinators of the Ranchi (*Government*) and Darjiling Circles. On the other hand, conspicuous decline is seen in the proportions of inspections of the Superintendent of the Behar Circle, of the Deputy Superintendents of the Darjiling and Ranchi Circles, and of the Superintending vaccinators of the Behar, Eastern Bengal and Ranchi (Licensed) Circles.

(*f*).—That with regard to the quality of the work of the vaccinators, the verifications of all the inspecting officers show that it was satisfactory in all the circles, except Darjiling, with regard to both the Government and Licensed vaccinations.

The following causes were submitted as accounting for the insufficient work of the year. In the *Metropolitan Circles* the chief cause of diminution of inspection work, both of the Superintendent and his Deputies, was the thoroughness with which the villages were protected in former years rendering it difficult to find subjects to be operated on. Moreover, some of the Deputies were new, elderly, and inexperienced men, and the Superintendent was detained in Calcutta for 15 days in the middle of the

season. *Darjiling Circle.*—Attention to special sanitary work, and office work necessitating return to head-quarters are urged by the Superintendent as preventing his performing as much vaccination work as might have been done. In 1882-83 he confined his inspections to the area traversed by the Government agency, but during the year under review he looked after the work of the licensed vaccinators in the districts in the plains, which is more scattered; but to visit only 100 villages in five months and verify 1·83 per cent. of the total number vaccinated, is to exercise merely a nominal control. A declining standard of success in the operations of the vaccinators—85·30 per cent.—followed from this imperfect supervision. *Ranchi Circle.*—The causes with regard to the decline in the Superintendent's work were, having proceeded to the Calcutta Exhibition; people determinedly refusing to produce their children for examination in many places on the pleas of tender age, sickness, jungle to be passed through, rivers to be crossed; and a great amount of time, which could have been bestowed on inspecting vaccinations having been lost in going over much ground extending over the whole circle, as his presence was necessary among the vaccinators owing to the gross misconduct of some of them retarding the progress of work. There was, however, no want of activity and no neglect of duty on the part of this officer. He had many difficulties to contend with. With regard to the Inspectors, it is stated that one of them suffered much from fever which interfered with his work, and to the Native Superintendents, that much of their time was taken up in trying to overcome opposition, and that one of them had supervision over a batch of operators who were very insubordinate and difficult to manage, and several of whom had absconded. The Deputy Superintendent of the *Sonthal Pergunnahs Circle* states that, the reduction in his work was due to breaks in his tour owing to illness and having to perform office work; to overcoming opposition to vaccination—particularly in the new areas in Monghyr; and to his having moved about in the Sonthal Pergunnahs district in suppressing small-pox for a longer time than usual. The Superintendent, however, does not consider this explanation satisfactory. He states that the Deputy Superintendent was this year relieved of a great portion of his usual office work; that it was clear that he displayed great neglect and apathy in his inspection work; that the Monghyr area being compact, he could have visited more villages if he had chosen to do so; and that he lost much time in various ways. With regard to the Inspectors, it is stated that, some of them lost much time in breaking down opposition offered to vaccination, and that others, who were looking after Government vaccinations, were deputed to supervise licensed operations. No explanation has been furnished by the Superintendent of the *Eastern Bengal Circle* with regard to the diminution in inspection work of his subordinates, except that the Deputy Superintendent, having been newly appointed, was inexperienced in his work, and that the area made over to one of the Inspectors, being intersected by rivers and khals, rendered inspection work difficult. The Superintendent of the *Orissa Circle* states that, owing to having spent the greater portion of his time in travelling distant areas between one district and another, a greater amount of inspection work could not be performed by him. No explanation has been furnished with regard to the decrease of work of his subordinates. The Superintendent of Vaccination, *Behar Circle*, in accounting for the decline in inspection work, states that much time was lost in inducing the people in the new areas in Chumparun and Shahabad to accept vaccination; and that the same was the case with his subordinates. Moreover, that he was detained some time in Patna in arranging his men for the protection of certain localities in that district, where small-pox had broken out very severely, and that in some places he had to proceed from village to village twice, and sometimes thrice, as the people could not be induced to present their children for vaccination at one and the same time.

Inspections in Municipalities, &c.

178. There is much reason to believe that, in the great majority of instances, the inspections of the Assistant Surgeons and other subordinate medical officers in charge of vaccination in the towns, dispensaries, &c., and the supervision exercised by them over the work of the vaccinators, are at best fitful and desultory, and that apart from their indifference in the matter it is difficult to get the people to

come to the dispensaries for examination after being vaccinated. The Civil Surgeons are willing, but not quite able, owing to their other duties, to render the active and sustained care that the subject needs; but there is evidence in the Reports indicating that this year more than usual attention was accorded, which resulted in a sensible increase in the number of the operations performed, and much improvement in the quality of the work produced. It is very creditable to Dr. Roy that he had every case of vaccination in the Soori town performed in his presence, and that he initialed the results in the register, and to Dr. Tomes, that he made a house to house visitation in the different sections of the town of Midnapore and in its vicinity, and watched the progress of vaccination in them.

Gross Expenditure.

180. The total cost to *Government* for vaccinations performed during the year amounted to Rs. 1,22,428-6-5, and of this expenditure Rs. 58,518-2-9 represents the cost of the operations conducted by the *Government establishment*, and Rs. 63,910-3-8 that of the establishment provided by Government for supervising the operations of the *Licensed vaccinators*. The cost of vaccination to the Municipalities, &c., was Rs. 8,845-10-11. Thus, the entire expenditure on vaccinations—*Government* and *Municipal*—amounted to Rs. 1,31,274-1-4. In comparison with the expenditure incurred for the same purpose in the preceding year the cost of operations by the Government agency was less by Rs. 13,226-15-8, while that by the Licensed agency was in excess by Rs. 19,569-7-10, shewing that on the whole the expenditure in the Vaccination circles had increased by Rs. 6,342-8-2. The Municipal vaccinations also cost more this year, viz. to the extent of Rs. 847-12-8. The whole cost of operations in the entire Vaccination area—*Government* and *Municipal*—consequently, exhibits an increase of Rs. 7,190-4-10 over the expenditure of the preceding year.

Average cost of each Successful Case.

181. The cost of each successful operation performed by the *Government agency* amounted to 2 annas 5⅓ pie, and by the *Licensed agency* to 1 anna 1¾ pie, aggregating 1 anna 6½ pie for both departments. Compared with the average expenditure of the preceding year, there was a decrease of $10\frac{5}{12}$ pie per operation by the *Government agency* with an increase of 3½ pie per case by the *Licensed agency*, resulting in a decrease of ¼ pie for each vaccination performed in the Vaccination circles. The Municipal operations cost 2 annas 1 pie each, against 2 annas 6¾ pie in 1882-83, showing a decrease of 5¾ pie per case. Thus, on the whole, the entire operations of the year—*Government* and *Municipal*—cost ⅓ pie each less than in the preceding year. In the Vaccination circles, individually considered, the cost per case varied, ranging be- between 9 annas 7⅓ pie in Calcutta and 8 pie in the Eastern Bengal Circle. The cost of operations in the Suburbs of Calcutta and in the Behar Circle also preponderated much over that of the other circles, being 6 annas 11⅓ pie per case in the former and 3 annas 4¾ pie per case in the latter. The extent

of the increase or decrease in cost per case in each Circle, as compared with the results of 1882-83, is shown in the margin. The most creditable reduction in cost per case was attained in the Behar Circle, while the highest excess of expenditure per case was incurred in the Suburbs of Calcutta.

	Difference per case in 1883-84 A. P.		Difference per case in 1883-84. A. P.

Ranchi " ...	0 2¼ D		

182. In addition to the regular expenditure incurred for vaccination, as set forth in the foregoing table, the following contributions were made in aid of the work:—

Contributions in aid of Vaccination Work.

Rs. 82-10-6 for two vaccinators entertained by Government for the interior of the Chittagong district.

Rs. 103-5-4 paid to a vaccinator employed by Government for vaccinating the Khas Mehal Estates of Angul and Basipara in Cuttack.

Rs. 43-5-4 paid from the Cantonment fund to a vaccinator for carrying on operations in the Dinapore Cantonment in Patna.

Rs. 64-14-0 paid from the Cantonment fund to two vaccinators for carrying on operations in the Dum-Dum and Barrackpore Cantonments in the 24-Pergunnahs.

Rs. 30-0-0 paid for operations performed in the Tajpore dispensary in Durbhanga from the Dispensary fund.

Rs. 50-0-0 paid for operations carried on in the Soorsund dispensary in Mozufferpore from the Dispensary fund.

Rs. 15-8-3 paid by the Railway authorities to a vaccinator for vaccinating the employés on the line of the Northern Bengal State Railway from Sara to Silliguri.

Rs. 200-0-0 paid for four vaccinators entertained by the Rajah of Hutwa for carrying on operations in the Hutwa, Gopalgunge and Bhori dispensaries in Sarun.

Rs. 55-2-6 paid by the Rajah of Durbhanga to a vaccinator for operations carried on in the Naraya dispensary in Durbhanga.

Rs. 60-0-0, being the cost of one of the two vaccinators employed in the Durbhanga Municipality, paid by the Rajah of Durbhanga.

Rs. 26-13-6 paid to a vaccinator for operations in the Chuckdighi dispensary in Burdwan by the Estate of Baboo Lolit Mohun Rai, proprietor of that dispensary.

Operations were also carried on at the Kurnafuli and Udalia Tea Estates in Chittagong by the native doctors attached to those Estates. The amounts paid to them have not been stated.

183. The Superintendent of the *Metropolitan Circles* has submitted no explanation as to the cause of the increase in the cost of each successful case in his circle. On the contrary, he states that, the cost of each operation in the Suburbs of Calcutta is less. Nevertheless, it is apparent that the increase is due, to some extent, to the expense of the establishment having to be distributed over a reduced number of operations. In the *Darjiling Circle* the increase was due to the entertainment of an additional clerk and of four Inspectors of licensed vaccinations, and to the Superintendent having been paid travelling allowance at a much higher rate under the new Travelling Allowance Code than he used to receive under the old rules. In the *Sonthal Pergunnahs Circle* the pay of the Civil Surgeon's clerk was increased; a portion of the vaccination establishment was retained during the recess on higher allowances than sanctioned for them for that period, in order to suppress small-pox in the Bhagulpore, Monghyr and Sonthal Pergunnahs districts; and the four Inspectors, sanctioned for this circle, were continued on the roll of the establishment during the whole of the year under review, while they were entertained from only October in 1882-83. The enhanced expenditure involved by these arrangements being distributed over a smaller number of successful operations, accounts for the higher cost per case.

Explanations accounting for increase of cost of operations.

184. In *Calcutta* vaccination is received willingly by all except the up-country people, whose resistance, however, is diminishing year by year. This year the lower class of this community resorted to the vaccine stations, and several respectable Marwari and Khettri families were induced to accept vaccination.

Attitude of the people towards Vaccination.

In the *Metropolitan* Circles the Hindus as a class and the ordinary Mussulmans accept vaccination readily, but of the former the *Itcha* (dependants on the wishes of Shitola, the goddess of small-pox) families, and of the latter the Ferazees resist it. The number of the former is diminishing every year. In the Raniguuge town in Burdwan, notwithstanding that the Compulsory Vaccination Act was introduced into it, most of the Marwaris could not be induced to accept vaccination. It is intended to enforce the law more vigorously. In the town of Burdwan a colony of confectioners, called moiras, give most trouble, but during this year considerable progress was made among them. The people in the Leakbund village in thannah Bishenpore objected to vaccination, because the first child operated upon died. In Bankura, the feeling of dissatisfaction hitherto evinced by the educated classes and the up-country traders has died out, and they now offer their children for vaccination. In mohullas Idza and Kotowali, in the town of Bankura, vaccination was persistently refused, but the difficulty was overcome. In the Birbhum district the Ferazees of Nulhati offered, as usual, determined resistance, and the vaccinators complained of being unable to realize their fees, particularly from the Mahomedans; the up-country people and the Marwaris are the stoutest opposers; and the Hindu villagers are led by the headmen; but in general there is no active opposition. The people, however, postpone the measure to suit their convenience till they are overtaken by small-pox, and even then refuse it. Dr. Roy writes strongly on this subject. He says: "This refusal at a time when the disease is imminent is, I consider, criminal, and to be treated as such. Some legal measure should be devised to meet this obstinacy. The Government should use its own discretion in enforcing laws for the common weal of its subjects, and the Compulsory Vaccination Act should be introduced all over the country without waiting to sacrifice lives for the development of knowledge and intelligence." In Tumlook, in Midnapore, objection is taken to virus being taken from the arms of children. In the Midnapore town passive opposition exists among the shop-keeper class, who sometimes give much trouble. In the Hughli district the people appear to have overcome their prejudices against vaccination, and to have learnt its benefits. In Serampore it is only objected to during months of mourning, or when a child is born, or when there is sickness. These are considered inauspicious times; but they recur too often. *24-Pergunnahs.*—At Dum-Dum there is much concealment and evasion. In the cantonment it is refused chiefly by the lower castes and Hindus. The same is the case in the South Barrackpore Cantonment. In the Naihatti and Baraset towns inoculation is considered superior; but in Baranagore and Baraset the people are eager, and voluntarily ask for vaccination. In Jessore the orthodox Hindus prefer inoculation. In Murshidabad the Jains and Ferazees obstinately resist vaccination: the Hindus and ordinary Mahomedans appreciate it. In the *Suburbs of Calcutta* some of the up-country people exhibit hostility, and sometimes give much trouble, and the lower classes of Hindus and Mahomedans do not come forward readily to receive vaccination. A notable instance of conversion to the measure this year was Babu Dinobundo Nundy, the zemindar of Polassi. For years past vaccination could not be introduced into this and the adjoining villages of Bashda and Dingol, owing to opposition offered by this zemindar. In 1882-83 Dr. Gupta wrote to him explaining the benefits of vaccination, and requesting his aid in propagating it, but he would not be persuaded. This year one of his children having been attacked by small-pox during an outbreak of the disease in these villages, he, through fear lest his other children might catch the contagion, had them all vaccinated, and his example was followed by his villagers and tenants; and thus these villages were thoroughly protected.

In the *Darjiling* Circle vaccination is generally appreciated; but here and there some opposition was met with, which generally gave way to the persuasions of the district officers. In Dinagepore the lower orders, whether

Mahomedans or Hindus or other classes, oppose vaccination, partly owing to ignorance and partly on the plea of previous illness. In Rajshahye the Hindus, chiefly the Brahmins, resist the measure, but passively. In the Rungpore town lukewarmness is evinced, but the presence of small-pox checks this feeling. In Maldah, although no determined opposition was offered, the feeling of the people is one of suspicion; but they are gradually yielding under conciliation. They object to the measure during the month of Pous (December), or when a female member of the family is pregnant. The educated, however, appreciate it. In Bogra it is greatly appreciated generally, but some delay the operation under the pleas of sickness, inauspicious days, &c. In the Darjiling town the Mahomedans resist, but the hill people—Bhootias, Lepchas and Nepalese—have no inherent objection to the measure. In Purneah the intelligent and influential classes are not in favour of it, and have themselves inoculated.

In the *Ranchi* Circle no disposition to receive vaccination is shewn by the people in the Kolhan in Singbhum. Some of them do not believe in the efficacy of vaccination. It is difficult to obtain success in vaccination owing to the people refusing to allow arm-to-arm vaccination, and those who, in consequence, were unsuccessfully vaccinated, resisted to the utmost all endeavours to repeat the operation. On this point the Deputy Commissioner reports, that in the beginning of this year, during an epidemic of small-pox, many persons already protected by vaccination or inoculation, and persons who had had the disease, were attacked by it, and several died; that this shook the faith of the people in vaccination which they were beginning to have; and that no amount of argument or explanation by him, during his tour, was of avail to disabuse their mind of the inefficiency and nullity of the measure. It is found that if the people bend to the measure at all, it is when a Brahmin offers them vaccination after performing a poojah or worship over the child. In the other parts of Singbhum the prophylactic is taken without objection. In the Lohardugga district the attitude of the people towards vaccination is very good. They however endeavour to postpone it on some plea or other. The aborigines (Ooraons and Mundas) readily take vaccination, and the Brahmins, Rajpoots, and Bunyas would not accept it were they not afraid to resist it. In Manbhum the people were not very much opposed to vaccination. In Hazaribagh the attitute of the people varies in the different thanahs, but generally strong opposition is offered by the Brahmins, Rajpoots, Kayesthas, Bunyas and Marwaries. The last named community, residing in Jhalda, Purulia and Raghunathpore, are stated to have evinced so strong a disposition not to accept vaccination that the Deputy Superintendent was unable to vaccinate any of them, even when small-pox was prevalent. In the Tributary States the people are willing to take vaccination if they are not interfered with by the Rajahs, who, it appears, dislike the measure because they cannot realize under it the income which they used to derive when inoculation was in vogue. In general the people object to arm-to-arm vaccination; to the employment of crusts; to virus being taken from the arms of their children, on the plea that the procedure weakens them; to being vaccinated in the hot weather, as they fear that ulcers will follow the operation; on days other than Tuesdays and Saturdays, for some religious reason; or during the "Chait festival" in January and the "Sooraj festival" in February; when drunk, which they often are, and then they are unmanageable. The zemindars who prominently opposed vaccination were Bhupat Sing of Garadi, Tikait Mongul Sing of Kesko, Modorai of Chungagurh, Muner Ram of Gaza Salem, and Kanoo Purganait and Janki Sai (the head of the Bunyas) of Dumri. The Rajahs of Jashpur and Bonai also resisted vaccination. The former, previously to the arrival of the operators, issued a proclamation by beat of drum, ordering the people not to take vaccination, and that he would personally inflict 12 stripes on any one who disobeyed the order. He, however, on receiving the Commissioner's perwanah, allowed vaccination to be proceeded with; but the perwanah had no effect on the Rajah of Bonai, and consequently no work was done in his State.

In the *Sonthal Pergunnahs* Circle vaccination is generally appreciated, except by the high class Hindus—Brahmins, Rajpoots, &c. There was no resistance met with in Bhagulpore, excepting in the Supul and Sudder subdivisions, the most determined opposer being Manick Chand Shaw, zemindar

of Borbonna, thanah Kolgong, who would not allow his children to be vaccinated, and presented great difficulty in the way of the vaccinators in operating on the people in his village. In the Sonthal Pergunnahs district, the Kheowar Sonthals were very obstinate and hostile, and the Islams, a class of Mahomedans, resisted it, but subsequently gave in. In the thanahs in Monghyr taken up this year the attitude of the people was not favourable. The Rajpoots and Jamida Brahmins, who form a leading portion of the population, displayed much hostility, being distrustful and suspicious of vaccination, and the wealthy classes, who are very conservative in their prejudices and backward in receiving new theories, also exhibited some resistance. The most notable opposers were the punchayets in Rotunpore in thanah Monghyr and of Kalianpore in thanah Kharakpur, and the people in Shosharpur and Shetpur in thanah Gogri.

In the *Eastern Bengal* Circle the great bulk of the people accept vaccination, though passively; but the ignorant and bigotted Hindus and Mahomedans of the Ferazee sect object to it. In the Dacca town the latter community paid the penalty of resistance during a rather severe outbreak of small-pox in their midst. In Backergunge the Mahomedans are averse to vaccination on religious grounds; the educated Hindus prefer it; but the uneducated submit to it only under pressure. In Chittagong the same feeling obtains, excepting when small-pox prevails epidemically; and some prefer to have small-pox naturally. In Noakhali, where a systematic beginning in vaccination was made this year, the measure was at first much impeded by the resistance offered to it, chiefly by some of the Mahomedans, on religious grounds, in which they were encouraged by the leading members of their community. But their prejudices were to a great extent removed, by explaining to them the object the Government had in introducing vaccination; by informing them that Government would bear the cost of the measure and they were not required to pay anything; and by reading to them futwas procured from the chief Mahomedan priests in Sudharam and Bamni, declaring that there was no harm in accepting vaccination. With regard to the rest of the people, the Magistrate says that the willingness with which vaccination was accepted by them is very satisfactory and encouraging. They appear to recognize the benefits of the prophylactic and its superiority to inoculation, and consider the introduction of the measure a benevolent action on the part of Government. In some instances there is hesitation (which is generally removed) because the process has to be repeated for keeping up its protective powers, and in other the scruples are traceable to the influence of the female members of the family, who are extremely conservative, the men, in most cases, feeling a difficulty in going against their wishes. But, on the whole, the ease with which the scheme was carried out makes the Magistrate hope that it may be further extended during the next working season.

In the *Orissa* Circle vaccination is generally resisted by those who are ignorant of its nature and benefits; but a large number of the higher and educated classes, who ought to be aware of the advantages of the measure, prefer inoculation, their indifference only giving way when they hear of the prevalence of small-pox; and it is then that they apply for the preventive. In Cuttack the people being aware that vaccination is not compulsory, bid defiance to the vaccinators, who have often to put up with a good deal of obloquy and insult in their endeavours to persuade the people to accept the measure.

In the *Behar* Circle, while the Mahomedans evince no great disinclination to vaccination, the Hindus, chiefly the Brahmins and Rajpoots, strongly oppose it. The latter doubt the protective powers of the prophylactic owing to no eruption following the operation, as is the case in inoculation, and they still labour under the idea that vaccination will entail fresh taxation. In Patna, opposition to vaccination is gradually dying out. In some cases application for it is voluntarily made; but the ignorant and superstitious, particularly in the northern parts of the Behar sub-division, hide their children from the vaccinators in order that they may not offend the goddess of small-pox—Mata Mai—and wish that they may get small-pox spontaneously when it pleases this deity. In Gya the Mahomedans appreciate the measure, but the wealthier classes view it with feelings of aversion, and are hostile to it, particularly the priests in the old town of Gya who discourage it by every means in

their power. In Shahabad the opposition is very great. The Mahomedans are less prejudiced than the Hindus, and of the latter, the lower classes, such as Ahirs, Domes, Chamars, object most. A great deal of small-pox being present in many places, the Magistrate repeatedly urged the people to take this opportunity to be vaccinated, pointing out the example of the Rajah of Dumraon and his family, who had all been vaccinated. He is not able to say that he met with much success. In Mozufferpore the better classes, both Hindus and Mahomedans, in common with the poor and ignorant, are averse to vaccination. In the Mozufferpore town the hostility generally is so great that the Civil Surgeon considers that the feeble vaccinating agency employed is never likely to combat it successfully. From Durbhanga the report is, that vaccination is "not yet appreciated by the people, as they have not yet shaken off their prejudices against vaccination, as education is very behindhand in Behar." Very great and marked reluctance exists among the Hindus and Mahomedans equally. In the town of Durbhanga opposition is exhibited in spite of the compulsory law being in force, inoculation being preferred. In Sarun, people of all religions are so prejudiced and stubborn, that the Civil Surgeon does not expect to see vaccination flourish in this district. No native, high or low, rich or poor, ever comes forward voluntarily to ask for the prophylactic for himself or family. He only puts up with the operation as it were, and submits to it, and it is quite impossible by any amount of explanation to engender a desire for its universal adoption. A certain amount of pressure has to be exercised on them, or there would be no vaccination at all. The Magistrate believes that the wide-spread outbreak of small-pox during the last four months will lead to more recourse being had to the prophylactic by the agrarian population in future. In Chumparun the measure is opposed to a great extent. In the Motihari town high caste Hindus and shop-keepers are, as a rule, averse to vaccination. The Mahomedans, the "Bengali Babu," and some poorer classes appreciate it.

Thus it will be seen that, while opposition to vaccination is still exhibited in every circle, a healthier view of the measure is continuing to gain ground. On the whole, the most backward districts are Hazaribagh, the Kolhan portion of Singbhum, Monghyr, and the districts comprising the Behar and Orissa Circles, excepting Patna in the former circle; the stoutest opponents are the higher classes of Hindus, the Marwaris, and the Mahomedan Ferazees; and the chief causes of aversion to the measure are objections based on religious grounds; leading members of communities setting a bad example and inciting the lower classes to resistance; the females having a strong objection to the measure, while the males are unable to set aside their entreaties; unwillingness to part with virus from the arm; objection to arm-to-arm vaccination; bad vaccination engendering disbelief in the protective powers of the prophylactic. It is believed in several places that if vaccination is performed with the religious ceremonies and rites customarily adopted when performing inoculation, it would be received with favour more generally; but to do so would be a great mistake.

Local and other aid in promoting Vaccination obtained during the year.

185. The information under this head, gathered from the reports, is subjoined:—In the *Metropolitan* circles the magisterial and Police officers of several districts, particularly Mr. Anderson, the Magistrate of Bankura, rendered much assistance to the cause of vaccination; and contrary to past experience, the Police officers in the Suburbs of Calcutta aided the vaccinating staff materially. In the North and South Dum-Dum Municipalities one of the Municipal Commissioners accompanied the vaccinator when performing operations, and exercised his influence wherever it was needed, and in the North and South Barrackpore Municipalities the Municipal Commissioners inspected the work of the vaccinators. These are the only instances on record in which Municipal Commissioners took an active part in promoting vaccination. In the *Darjiling* Circle assistance was given by almost every one applied to, including the Managers of tea gardens, except the Managers of the Bannockburn and Alibong tea gardens who raised objection to vaccination during the plucking season. In the *Sonthal Pergunnahs* Circle the Magistrate of Bhagulpore rendered valuable assistance in suppressing small-pox in thanahs Sultangunge, Kolgong and Bhagulpore; the Sub-Divisional

Officer of Jamui promoted vaccination to the best of his ability; the Manager of Rajah Leelanund Sing in thanah Kharakpur caused vaccination to be carried on in the zemindary; and Mr. Craven, Sub Divisional Officer of Godda, broke down the opposition of the Kheowar Sonthals and the Brahmins of the place. In the *Ranchi* Circle Major Garbet, the Deputy Commissioner of Singbhum, and Mr. Power, the Deputy Commissioner, and Mr. Mackie, the Officiating Deputy Commissioner of Lohardugga, rendered much assistance in promoting vaccination and in overcoming opposition. The Commissioner of Chota Nagpore was the means of setting vaccination going when it had come to a standstill in the Native States. The Police also rendered aid, particularly Inspector Mahendi Hossein and his Sub-Inspector. The Superintendent of Vaccination, *Eastern Bengal* Circle, reports that no cordial help was accorded to vaccination by any one except the Civil Surgeon of Pubna, the Magistrate of Noakhalli, and the sub-divisional officers of Jamalpore and Serajgunge. "It was the 'cold shoulder' everywhere. The Joint-Magistrate (sub-divisional officer) of Serajgunge being well disposed towards vaccination, issued orders *helpful* to the cause. He left on tour, and his *locum tenens*, Babu Purna Chandra Mitra—strange to say—*undid* the work of the Joint-Magistrate by issuing *new* orders, that it was *optional* for the people to receive vaccination or not. Of course vaccination was declined." The Magistrates of Cuttack, Balasore and Puri, although asked, declined to render assistance, on the ground that vaccination is not compulsory. The Police consequently received no instructions. In the *Behar* Circle, Babu Jugdeo Sivha, zemindar of Bhudwoe in thanah Arrah, had his own children vaccinated, and thereby set an example to the people in his zemindary, who after this readily accepted the prophylactic. The Police officers are stated to have been indifferent in the matter generally, conspicuously the Sub-Inspector of Dhookee in Chumparun, to whom is referred the non-progress of vaccination in his jurisdiction. The Civil Surgeon of Durbhanga remarks that active assistance for promoting vaccination in the town was applied for, but could not be given by the local Magisterial and Police authorities, *first*, because such aid would be compulsory and therefore illegal, and, *secondly*, because the Police element, which must be introduced, would afford an opening for bribery, and he very appositely adds that, "the aid of these authorities may therefore be considered as moral only, and that was given freely, but it did not lead many people to be vaccinated."

Extension of Compulsory Vaccination Act.

186. The Compulsory Vaccination Law, Act V (B.C.) of 1880, was brought into operation during the year under review into the 55 Municipalities, four Cantonments, and four Rural circles named below:—

Burdwan District.	Bydobatti town.	Basirhat town.	Chanduria town.
Burdwan town.	Kotrung „	Taki „	Debhata „
Raniguuge town.	Serampore „	Baduria „	*Murshidabad District.*
Kalna „	Utterpara „	Gobardanga „	Berhampore town, including Cantonment.
Dainhat „	*24-Pergunnahs District.*	*Nuddea District.*	
Cutwa „	North Suburban or Baranagur town.	Krishnagar town.	Lalbagh town
Bankura District.		Santipore „	Kandi „
Bankura town.	South Suburban town.	Ranaghat „	Jangipore „
Bishenpore „	Rajpore „	Nuddea „	*Maldah District.*
Midnapore District.	Barripore „	Kushtia „	English Bazar town.
Midnapore town.	Joynagar „	Meherpore „	*Cuttack District.*
Kheerpai „	South Dum-Dum „	Birnaggar „	Cuttack Cantonment.
Ghatal „	North ditto „ including Cantonment.	Kumarkholli „	*Bhagulpore District.*
Chundrakona „		*Jessore District.*	Bhagulpore town.
Ramjibanpore town.	South Barrackpore town, including Cantonment.	Jessore town.	Kolgong „
Tumlook „		Mohespore „	Bhagulpore thanah.
Hughli District.	North Barrackpore town.	Kotchandpore „	Kumargunge „
Bhuddesher town.	Baraset town.	*Khulna District.*	Kolgong „
Bansbaria „	Naihati „	Satkhira town.	Bihipore „

Thus, the law was, up to the close of 1883-84, in force in 77 places. Both the Magistrate and the Civil Medical officer of Dinagepore advocate its introduction into the Dinagepore Municipality, in order to meet the opposition to vaccination by the lower classes of the people; and also all over the district, if complete vaccination is aimed at. Similarly, the Civil Surgeon of Chumparun thinks that it is desirable to extend the same measure to the towns of Motihari and Bettiah; and the Civil Surgeons of Chittagong and Cuttack reiterate their opinions on the necessity of utilizing the law in their towns,

the latter officer stating that now the majority of the Municipal Commissioners have no objection to the proposition. The Superintendent of Vaccination, Ranchi Circle, recommends the extension of the law to the Hazaribagh town, where there are many European inhabitants, and where the people themselves say that they will not accept of vaccination, because it is not compulsory.

Administrative details connected with the working of Act.

187. The administrative details connected with the working of the Act were, *mutatis mutandis*, identical in all the places into which it was brought into operation, *i.e.*, vaccine stations, suited to requirements, were established; dates and hours for carrying on the operations fixed; vaccinators, sufficient in number, appointed; publicity given by beat of drum, placards, &c., that the law is in force, and what are its requirements and the obligations of the people under it, &c. The following observations, therefore, relate only to the attitude exhibited by the people towards the introduction of the enactment, the steps which were adopted to enforce its provisions, the results of the measure; and to other cognate matters.

Law how worked in Towns into which it was introduced this year.

188. Taking up first the Towns or Areas to which the Act was extended this year, we find that in *Burdwan* it was favourably received in all its five Towns into which it was introduced, expecting Ranigunge, where the Marwaris objected to have their children vaccinated in spite of the powers conferred by the Act for compelling compliance. These powers will, it is said, be more rigorously enforced in future. Operations were carried on in the vaccine stations, and calls for home vaccinations were also attended to. In the two Towns in *Bankura* the Act was received without opposition, and was worked smoothly. In *Midnapore* effect could not be given to the law during this year in Kheerpai and Ramjibanpore for want of "lymph and other materials." Much unwillingness and opposition were met with at Chundrakona, less at Tumlook, none at Ghatal. In the last named town, however, great aversion was exhibited by parents to lymph being taken from their childrens' arms, and in Tumlook it was observed that protection by previous vaccination, inoculation and small-pox was general. In the Midnapore town there was more indifference than active opposition to the measure, and this resulted in no one resorting to the stations to be vaccinated. The vaccinators were, therefore, directed to remain one hour at their stations, and then to make a house to house visitation during the remainder of their time, taking with them vaccinifers, and to offer to vaccinate gratuitously, informing the people at the same time that they have to attend at the stations, and what were their liabilities under the law. The Civil Surgeon also visited the stations. As still no satisfactory progress was made, the provisions of the law were enforced, notices served, and some of those who persisted in not having their children vaccinated, prosecuted and either fined or warned. These measures effected great improvement, for while only 64 operations were performed in March, 300 were effected up to the 20th April, the date of report. The Civil Surgeon observes correctly, that time, patience and perseverance are required to bring the Act into complete working order and break down the long established house to house optional method, and that birth registration will have to become very much more perfect before the Act can be carried out in its entirety. Home vaccinations were carried on in Ghatal and Midnapore towards the end of the year, and realized Rs. 28-4 in the former town and Rs. 10-12 in the latter. The Civil Surgeon considers the Vaccination Act defective. "It might reasonably be supposed," he writes, "from its title that the Compulsory Vaccination Act where in force would afford in the Municipality full and efficient power to promptly stamp out any outbreak so soon as a single case of small-pox appeared, but I am disappointed to find that it is perfectly powerless to do anything of the kind. For the proper protection of an affected area it is absolutely necessary, in the first place, to find out all the unprotected persons living therein, and then to vaccinate them forthwith until an eccentrically widening zone of protection is established around it. The Act makes no provision for the supplying of correct information, house-holders are under no compulsion to report correctly, and it is well known that among the ignorant classes, when once small-pox has appeared in a family, the members for the time become averse to vaccination. The goddess Sitola has arrived and must not be interfered with; they will even

resent enquiry, and will purposely give false information. This I have experienced myself in one instance, and in another a policeman making enquiries about small-pox was set on and beaten. Again, when unprotected persons are discovered, or are already known, if these are infants under 12 months, their vaccination cannot be enforced until they are a year old; if adults, the law allows them 15 days extension of 'unprotection' before they are liable under penalty. Under these circumstances the Municipality is no better off as regards the extinction of an epidemic of small-pox with the Act than it was without it." In *Hughli* the law is reported to have worked satisfactorily in all its six Towns into which it was introduced this year, and the people generally offered no objection to have their children vaccinated. In *Serampore* it was not deemed advisable, in this the first year of its introduction, to enforce generally the provisions of the law requiring the payment of fees for home vaccinations, as people, it was found, would not sometimes resort to the vaccine stations to be vaccinated. This was particularly necessary in the mills at Champdanni and in Rishra, as they form convenient centres for the preservation of lymph and furnishing of vaccinifers for home vaccinations. In the *24-Pergunnahs* the law was brought into operation in all its 15 Municipalities and two Cantonments from the beginning of the working season. It was received by the people without objection; but the Cantonment Magistrate of Dum-Dum says, that no practical advantage was derived by the introduction of the law as it stands, for the following reasons:—"Under section 30 no offences under the Act can be prosecuted without the authority of the Lieutenant-Governor or Superintendent of Vaccination. No prosecutions have been sanctioned or instituted, although the vaccinator has complained to me that there are several parents who have refused to permit their children to be vaccinated, and there are, without doubt, very large numbers of unprotected children who have not been produced for vaccination. It would, in my opinion, be desirable [the Magistrate agrees with the recommendation] that the vaccinator's complaints should be cognizable by the Magistrate without reference to further authority. As it is, the vaccinator has informed me that he has reported several cases for authority to prosecute, but without result, and the law has, therefore, remained up to the present time a dead letter. The number of infants under one year of age who were vaccinated were 16 in South Dum-Dum, 12 in North Dum-Dum and 6 in the Cantonment, giving a total of 34 for a population of over 20,000. The birth-rate is unknown, but putting it as low as 15 per 1,000, it would appear that only about 11 per cent. of the children born have been vaccinated. This is not a satisfactory conclusion, and better results could be obtained if the working of the Act were made more practicable." The law is said to have been received without opposition in the 8 Municipalities in *Nuddea* into which it was introduced, except by the Marwaris in Kushtia. But its requirements have been explained to them and, if necessary, it will be enforced to break down their opposition. The report from *Murshidabad* is that, vaccination was performed gratis at all the vaccine stations in the four Municipalities into which the law was brought into operation, and that for home vaccinations a fee of four annas per case was charged. In the *Bhagulpore* district the Act was brought into operation in February 1881 into the Sudder sub-division, comprising thanahs Bhagulpore, Kumargunge, Kolgong and Bihipore, including the Municipalities of Bhagulpore and Kolgong. This is the first instance of the introduction of the Act into Rural areas. Additional vaccinators were engaged and stationed one at each outpost, and a head vaccinator was appointed to supervise their work; and the ryots were made aware of their obligations under the law by beat of drum. They did not, however, take their children to the stations for vaccination, and the vaccinators were obliged to go from house to house, as before, to carry on the work. As, however, the Act allows 12 months time within which operations may be performed, it could not be fully enforced this year. In the *English Bazar* town in Maldah there was some resistance exhibited, and several notices had to be served in consequence, and in one case a prosecution was instituted resulting in the party consenting to be vaccinated in his house. In the *Cuttack Cantonment*, which includes one of the populous sections of the town, where many native merchants and other influential people reside, the law is said to have been received without much

objection. No information as to the working of the Act in the Municipalities in the *Khulna* and *Jessore* districts has been received.

189. The following reports were received with regard to the Towns in which the law had previously been in force. In *Calcutta* the provisions of the Act were carefully carried out. The parents or guardians of 5,691 children having failed to produce satisfactory certificates showing that their children had been vaccinated, the cases were inquired into, and 3,119 of this number were vaccinated, 573 were found to be ill and vaccination in their cases postponed, 1,142 were stated to have left the town, 218 had died, three had previous attacks of natural small-pox, 630 could not be traced, and 6 were prosecuted, but received vaccination under orders of the Magistrate. The best evidence of the satisfactory working of the law, and of the willingness of the people to receive the prophylactic, is seen in the steady increase of station vaccinations year by year. This year the number of persons vaccinated at the stations amounted to 5,454, or at 57·18 per cent. of the entire number vaccinated, as opposed to 44·81 per cent. in the preceding year. The home vaccinations came to 1,524, or 15·97 per cent. against 12·23 per cent., and bustee vaccination to 2,560, or 26·85 per cent. against 42·94 per cent. The percentage of the latter class of vaccinations would have been smaller but for the prevalence of small-pox. The fees realized for home vaccinations amounted to Rs. 381 against Rs. 348 in 1882-83. In the *Suburbs of Calcutta*, all classes of the people, excluding the up-country men, receive the law favourably, the upper classes of Hindus and Mahomedans appreciating it. Great difficulty, it is again reported, was experienced in enforcing the payment of fees for home vaccinations, owing to no provision existing in the Compulsory Vaccination Act to compel this payment, and thus much of the time of the vaccinators, which could have been given to operations, is lost in endeavouring to collect the fees for remittance to the Municipality. With regard to this subject, viz., the difficulty of realizing fees, but with reference to the licensed vaccinators in the Bankura district, Dr. Ghose submits that, considering the fact that the apathy of the natives with regard to sanitation and preventive medicine is very great, so much so that they would rather leave their children unprotected than go out of their way to have them vaccinated, although the whole of the population of the district has been protected by the Government agency, still, unless the licensed vaccinators are provided with the means of compelling the payment of their fees, and also of enforcing vaccination, a large population will grow up unprotected in the course of years. As a remedy for this, he suggests that if the application of the Compulsory Vaccination Act to the rural population be considered too severe, or not workable under the present system of village administration, a simple law should be devised to be worked by the village Police. In the *Soori* Town in Birbhum the Act continued to work satisfactorily and well, as is evidenced by the absence of small-pox since it come into operation, now two years. The notices which were issued were in all cases complied with without the necessity for prosecution. It was, however, noticed that the people postponed operations to suit there own time and convenience. In the *Hughli and Chinsurah* Municipality the law is said to have continued to work satisfactorily. The operations are carried on under the supervision of the Civil Surgeon, who is supplied with a copy of the register of births. The vaccinators go to the houses of the children indicated in the register, and request their parents or guardians to carry them to the nearest vaccine station to be vaccinated. Those who neglect to do so are, after a warning, served with notices, and if they still do not comply with the requirements of the law, proceedings are taken against them. But this, as a rule, is not necessary. The Civil Surgeon visits the vaccine stations periodically and tests the correctness of the registers kept up in them by comparing the entries with the children vaccinated. In the *Howrah* Municipality the law continued to work satisfactorily, except that the Behari coolies in the jute and cotton mills had not given up their dislike to the arrangement, and that the Mahomedans, chiefly of the lower classes, and one or two well-to-do and educated Hindustani zemindars, refused to take the prophylactic. Notices were served, and the opposition was checked. Eight hundred and thirteen persons resorted to the depôts for vaccination, and 4,734 were operated on in their homes, Rs. 315 being realized on the latter account. In some cases the fees were not paid, and many poor but res-

Law how worked in Towns into which it was introduced previously.

pectable women, unable to attend at the depôts, were vaccinated gratis at their houses. In the *Beauleah* Municipality in Rajshahye the Act continued to work remarkably well, but a few notices, resulting in compliance with their requirements, had to be served, chiefly on Hindus. Home vaccinations, on payment of the usual fee, were also carried on. In the *Rungpore* Town also the law continued to work satisfactorily. The usual station and home vaccinations were carried on. The assistance rendered by the Magistrate and the Police, and the publicity given to the law, ensured the attendance of the unprotected children at the vaccine stations, and the additional operations conducted by the Civil Surgeon and Civil Hospital Assistant produced a satisfactory result. The vaccinated children are assembled at the dispensary on the seventh day after operation, and inspected by the Civil Surgeon. In the *Bogra* Town the law continued to work satisfactorily, there being no complaints. In the *Pubna* Town the operations are carried on under the supervision of the Superintendent of the Eastern Bengal Circle; but the Civil Surgeon is of opinion that if the law is worked by the Municipal Commissioners themselves, the great opposition offered to vaccination, chiefly by influential persons, will give way. In the *Gya* Town the law was received with aversion and opposition, chiefly by the Hindus, of whom the wealthy class and the priests of the old town of Gya were the most determined opponents. The Mahomedans exhibited a better spirit. Six hundered persons were prosecuted for resistance, and 36 of this number were fined Rs. 105-8 and the others warned and directed to have their children vaccinated, which order they carried out. On the whole, however, the working of the law is progressing steadily, and the increase in the vaccinations of the year is said to be due to its operation. In addition to depôt vaccinations, home vaccinations were also carried on, which realized a fee of Rs. 153-4-0. In the Towns of *Monghyr* and *Jamalpore* the law continued to be worked satisfactorily, but yet 36 persons, chiefly the well-to-do, notably the Marwaris, were prosecuted for resistance, and fined one rupee each, which had a very good effect on the rest of the people. On the whole, the advantages of vaccination are beginning to be understood in those towns. The home vaccinations realized Rs. 111-8 in Monghyr and Rs. 25-8 in Jamalpore.

Outturn of operations under the working of the Act.

190. The returns for 1883-84 from the above named Municipalities and other Areas into which the Compulsory Vaccination Act was introduced during past and present years indicate that on the whole there was an increase in the number of vaccinations performed, to the extent of 5,369, and that of the primary operations 97·01 per cent. proved successful and of the secondary 29·14 per cent. This progress, in the initial stage of the working of the law, is satisfactory.

Particulars regarding Inoculation.

191. Act IV (B.C.) of 1865, prohibiting the practice of inoculation, was extended during the year to thanahs Brahmanberia, Nabinagar, Moradnagar, Kotwali and Chandina in *Tipperah*; to thanahs Silao, Attaserai and Behar, (excluding the town in which the law was in force) in *Patna*; to thanahs Arrah and Belauti in *Shahabad*; to thanahs Adapore, Dhaka and Motihari in *Chumparun*; to thanah Jehanabad in *Gya*; and to thanahs Sudharam and Bamni in *Noakhalli*. Preliminary steps were also taken for the introduction of the law into the rest of the thanahs in *Patna* in which it is not in force.

The above law is in force throughout the *Metropolitan* circles. The Magistrate, however, states that inoculation is still practised clandestinely, but to a small extent, in *Midnapore*, the home of the inoculations being in thanah Sabang in this district. Suspicion of similar practice attaches itself also to the *Murshidabad* district. In the *Darjiling* Circle also the law is in force and observed throughout, excepting that it is suspected that it is infringed clandestinely in some parts of Maldah. Inoculation is practised freely in the parts of Nepaul bordering on the Darjiling district, and to a less extent in Sikkim and Bhootan, whence small-pox is introduced into this circle, and thus counteracts, in some measure, the protection afforded to it. In the *Ranchi* Circle inoculation, which is prohibited throughout, is not known to be practised. In the *Sonthal Pergunnahs* Circle this practice, besides being in vogue in those parts in which the prohibitory law is not in force, is secretly carried on in places in which it is in operation, such as thanahs Gogri and Jamui, and even in the Municipalities of Monghyr and Jamalpore. In the *Eastern Bengal* Circle inoculation is reported to be freely practised

wherever it is not prohibited by law, and to be encouraged by the wealthy Hindus chiefly, and by the Mahomedans occasionally. It was detected in the Kissorgunge sub-division in Mymensing, and is resorted to only in those places in Noakhalli where difficulty is felt in obtaining vaccination in order to arrest small-pox. In the *Orissa* Circle inoculation prevails everywhere beyond municipal limits where only the prohibitory law is in force; but it is sometimes practised clandestinely in the Cuttack town. The places in which it is most in vogue are the Jellasore and Basta thanahs in Balasore, parts of the Khurda sub-division and Bhobaneswar in Puri, and village Beraja in the Jaipur sub-division in Cuttack. It is, however, gratifying to learn that in Cuttack "as vaccination is extending the work of the inoculators is less called for and not so remunerative as it has been." In the *Behar* Circle the practice of inoculation is universal, even in some of the Municipal and Rural areas in which the prohibitory law is in force, such as in thanahs Dinapore, Barrh and Bikram in Patna; in the Patna Municipality, where ex-inoculators under cover of their licenses do the mischief; in the town of Behar, among some rich families; in thanahs Arrah and Belauti in Shahabad, also by ex-inoculators under cover of their licenses; and in the Durbhanga town "with impunity," but here steps are being taken to stop the practice, and to introduce the Compulsory Vaccination Act. The Superintendent of this circle reports that some cases in which inoculators were detected in plying their trade were reported to the Police, but they exhibited indifference to the matter, and took no steps to prosecute the offenders, and that thus this duty devolved on the vaccinators.

Influence of inoculation on Small-pox.

192. The evils of granting licenses to ex-inoculators to practise without supervision are sufficiently illustrated in the above cases, and are much to be deprecated. The general conviction is strong that small-pox is propagated by inoculation, but for want of means and leisure for making investigations, the Vaccinating and Sanitary Officers have not been able, except to a very limited extent, to submit any positive evidence on the subject. The incomplete data that have been furnished show (*vide* table in the next paragraph) that 11·80 per cent. of attacks calculated on total attacked, and 11·73 per cent. of deaths calculated on total mortality, occurred in persons who had been inoculated. The Civil Surgeon of Mozufferpore offers the opinion that, it is only in years when small-pox prevails epidemically that the practice of inoculation, by keeping up the disease and starting new centres of infection, does active harm; but that in ordinary years the dangers arising from the practice are not very great, for it is no exaggeration to state that during long intervals of non-appearance of the disease in violent form thousands of persons are inoculated. These views are contrary to my experience in Lower Bengal.

Influence of Vaccination on Small-pox.

193. The reports indicate that whenever information of outbreaks of small-pox was received, vaccinators were sent to the scene of its ravages to stamp it out, and that, as a rule, success attended the step, excepting when the people would not accept of the prophylactic, or impeded the action of the vaccinators through the many devices which they employ to evade vaccination. I feel bound, however, to state that the local authorities do not, in very many instances, furnish information of outbreaks of the disease to the Vaccination Department. The furnishing of information should be the rule and not the exception, and if this were so, large saving of life would be effected. The marginal figures, compiled from data furnished by some of the Superintendents of Vaccination, indicate the relative values of vaccination, inoculation, and non-protection, and are significant leaving no room for comment; and the subjoined table, furnishing co-relative information, shows that while the mortality from small-pox in the areas *unprotected* by vaccination stood as high as ·25 per 1,000 of population, it amounted in the *fairly-well protected* areas to only ·17 per 1,000, and in the *thoroughly-protected* areas to the still lower ratio of ·07 per 1,000.

	Cases.		Deaths.	
	Number.	Ratio per cent. to total attacked.	Number.	Ratio per cent. to total mortality.

Manbhum ...	3	17,006 4 10	36·73	22·08	12·82	49·55	...	5·48
GRAND TOTAL ..	177	33,28,762 6 1	34·48	30·75	18·20	52·68	3·38	15·04

The total income, it will be seen, amounted to Rs. 33,28,762, against Rs. 31,06,731 in 1882. Of this income 34 per cent. was expended on Sanitary Works, against 31 per cent. in the preceding year; 3 per cent. on Police, against 9 per cent.; 18 per cent. on Roads, against the same proportion, and 15 per cent. on other requirements, against 24 per cent. It is gratifying to find that on the whole the largest proportion of the income was assigned for Sanitary improvements, and, moreover, that there was a sensible increase in this proportion as compared with the percentage allotted during the preceding year, which of itself was considerably in advance of the apportionment of 1881. This improvement is no doubt due, in a large measure, to the Municipalities having, with the exception of Howrah and the Suburbs of Calcutta (whose cases are, however, under consideration with the view to removal of the major portion of the burden of the charge), been relieved of the cost of Police establishment, pursuant

to the orders of Government on the subject. Nevertheless there were towns (happily small in number) which did not divert an equitable share of their income towards the improvement of their sanitary conditions. These are the 13 in the districts named in the margin:—

Khulna	... ...	11·32
Mymensing	... ...	17·93
Noakhalli	... ...	21·30
Chittagong	... ...	22·55

On the other hand a large number of the towns utilized an appreciable, in some cases the major, proportion of their revenue in this direction. These are the 99 in the districts of—

Districts.	Percentages of income.	Districts.	Percentages of income.	Districts.	Percentages of income.
Julpaiguri	68·86	Tipperah	40·07	Faridpore	35·48

Bhagulpore	40·74	Cuttack	35 62		

196. The marginal table indicates the special purposes for which the amount allotted for the sanitation of towns (Rs. 11,47,930, against Rs. 9,55,429 in 1882, exclusive of Rs. 6,06,160 the cost of constructing and maintaining roads) was expended. Compared with the preceding year, great improvement is observable, particularly under the important heads of Water-supply, Conservancy and Latrines, and Treatment of the sick. The large increase of expenditure under the head of Water-supply was incurred principally in providing a water service for the Burdwan town, which cost no less than Rs. 1,10,519.; in further extending the water-supply scheme of the Darjiling town to other parts of it and to Kurseong at a cost of Rs. 10,523, and in improving the defects of the water-works at Dacca at an expenditure of Rs. 2,638. The reports also show that a much larger number of public latrines with appliances for working them, and of carts with draught cattle, was provided than in 1882, and this accounts for some of the increase under the head of Conservancy; while the larger expenditure under the head of "Treatment of the sick" is no doubt due to greater care and attention having been bestowed on providing facilities for their treatment—Darjiling alone having expended Rs. 12,806 for roofing with iron the charitable and small-pox hospitals and a barrack. On the other hand, the chief reduction is seen under the head of Drainage, but this decrement is traceable to so much as Rs. 32,917 having been expended in 1882 on the great drainage scheme of the Lalbagh Municipality in Murshidabad.

Details of expenditure on Sanitation.

GENERAL PROGRESS IN SANITATION.

Description of Sanitary Works executed in Towns and Districts.

197 The foregoing table, however, exhibits the cost of both original sanitary works and annual recurring incidental works, such as widening and re-metalling roads, lighting, wear and tear of plant, establishment charges, removal of jungle and other impediments to the free perflation of air, repairs of all kinds, &c. The cost of the former separated from that of the latter amounted, so far as data are available, and excluding the expenditure incurred under the heads of Vaccination and "Other Sanitary Works," and including the cost of Roads constructed and newly metalled, to Rs. 5,84,101. Details of these original works are furnished in Appendix III. The conclusion to be drawn from this account is that very satisfactory

progress in sanitation was made during the year under review. A notice of the principal works executed during the year, or which were considered for early adoption, is subjoined.

In the Towns.

198. **Drainage.**—In the *Serampore* Municipality a scheme for radically improving its drainage has been devised at an estimated cost of Rs. 30,091, towards which Government has contributed Rs. 15,000 and has authorized the raising of the loan of a similar amount. In the *Ghatal* town in Midnapore, a scheme, estimated to cost Rs. 4,000, for the opening up of a sluiced khal, having for its object the thorough drainage of the town, has been taken in hand. One end of this khal will receive fresh water from the river above the town, and the other end will carry off foul water into the same river below the town. As an initial step towards effecting the contemplated improvement of the defective drainage of the town of *Berhampore* in Murshidabad, a survey has been made and levels taken. In *Lalbagh* in the same district, as supplemental to the great drainage scheme which was completed in 1882, a system of subsidiary drains is to be laid out, and, as a beginning, a surface drain in connection therewith has been constructed in the Shahanagore ward at a cost of Rs. 700. The drainage works at *Azimgunge*, also in the same district, were taken in hand and are expected to be completed during the year 1884. A scheme is in hand in the *Dinagepore* town in extension of the present one, and will be completed shortly, for the drainage of the western portion of the town. It is anticipated that this project will materially improve the sanitary condition of the Municipality and its environs. Great efforts are being made for the improvement of the badly sanitated and straggling town of Chittagong. A systematic survey is being made, having for its object the provision of pucca drains and a bridge, the improvement of an important drain running through its large bazar, and the re-digging of the Choktai Khal for the improvement of the drainage of a large section of the town. Government has already given a grant of Rs. 10,000, and intends to bear a further share of the expenditure required for these purposes. These works, when completed, will, no doubt, benefit the town very materially. In *English Bazar* in Maldah, the drainage is stated to have been much improved. Large open drains were constructed with a good fall away from houses, with the means of being flushed, so that surface impurities and stagnant and foul water from hollows and excavations can be carried off, and the inhabited parts of the town and villages kept as dry and well-drained as possible. But I found, when inspecting this town in January last, that the drains were blocked generally throughout, that the new drains were frequently so deep as to act like elongated cess-pools, and that in Mukdumpore there was still no visible exit to the surface water, the pucca drains having a lower level than the kutcha one supposed to carry off the water. In the *Cuttack* town the drainage scheme commenced in 1879, was progressed with by the construction this year of a branch drain from Gooptipool, by which much surface water will be carried off from the central part of the town. Some bridges were built over the drains and some of the latter were lined with stone to prevent percolation of their contents into the sub-soil. It is believed that the town is now fairly well drained.

In the Districts.

199. Further improvements were effected to the drainage of the fever-stricken district of *Nuddea*. Obstructions to drainage caused to the road from Chagda Railway Station to Bongong were removed by the provision of drains, three wrought-iron girder bridges and 19 culverts at a cost of Rs. 11,499, including a moiety of the amount which falls to the share of the Bongong sub-division which has been transferred to Jessore. Two large timber bridges were taken in hand on the road from Kumarkhali to Kanchadier in the Kushtia sub-division. One of these was completed and the other was in progress. This work, which cost Rs. 1,853, is calculated to improve a large tract of country lying on the western side of the first four miles of the Kumarkhali road. Four bridges and four culverts were put up on the road from Khaksha Railway Station to Khaksha Bazar at an expenditure of Rs. 6,817. In *Murshidabad* the two main cuts—the northern and southern—about 8½ miles in length, which drain the Berhampore town and the low levels and bheels between the town and

Gobra nullah, and the Farashdanga cut which drains the Katigunj bheel which receives the drainage on both sides of it, were cleared and deepened. In the Balughat village in *Dinagepore* new drains were provided and the roads raised in order that obstructions to drainage may be removed. In the *Sarun* district the Bengal and North-Western Railway has progressed. This undertaking, the Magistrate says, will have an important bearing, for the future, on the health of the district, inasmuch as he believes that, as the general water-flow is, in the first instance, from the *river bank* northwards, and as for the first 35 miles of its course from Sonepore the railroad runs parallel to the river and only a mile or two from it, the whole of this most densely populated tract of country would become water-logged if the waterway through the railroad were insufficient, which he thinks, for reasons submitted by him, *is* insufficient under the arrangements at present adopted by the Company. This question is, however, being considered by the District Engineer. In the *Sonthal Pergunnahs* a survey of the great swamp to the south of Rajmehal, which is a source of much disease, was made with a view to improve its drainage.

200. **Water-Supply.**—Much progress was made this year towards the completion of the water-supply scheme for the *Burdwan* town, referred to in the Report of the last year. Three settling tanks were completed; considerable progress made in the construction of the masonry clear-water reservoir; pipes laid down in the principal streets of the town, and the filters were under construction. The total expenditure incurred this year amounted to Rs. 1,10,519. In the *Hughli* Municipality a project for supplying filtered water to the whole town is under consideration. The scheme for supplying the *Howrah* Municipality with filtered water, estimated to cost Rs. 13½ lakhs, was submitted to and considered by Government; but as it was doubtful whether it would be wise to take the water from the Hughli at Rishra, or from any part below Pulta, it was determined that this point should be settled first. The matter was therefore referred back to the Commissioners, and they were at the same time asked to prepare a combined scheme of water-supply for all the riparian Municipalities between Serampore and Howrah. I will again refer to the latter scheme in a subsequent paragraph of this section of the Report. The question of the extension of the Calcutta water-supply system to the *Suburbs of Calcutta* is in a fair way to accomplishment, one of the great difficulties in the way of the Suburban Municipal Commissioners having been removed by the Government agreeing to relieve the Municipality of one-half—about Rs. 38,000—of the charge for the Police from the beginning of the official year now current. The scheme will admit of the supply of 4,000,000 gallons of water daily (to be restricted at present to half the quantity); the necessary machinery is on its way from England; and a Bill to give effect to the scheme and to authorize the Commissioners to levy a water-rate is under consideration. In the *Berhampore* town in Murshidabad a channel with sluice was constructed through Gorabazar, commencing near the circuit-house and leading into the Chaltea bheel. This work is said to confer great benefit on the people in Gorabazar and its neighbourhood, as it drains the Gorabazar ward of surface water, and flushes several tanks and some shallow basins with water from the Bhagiruthi, and thus secures a fresh supply for the people. In *Darjiling* three additional jhoras or springs were connected with the main pipes from Senchal, by which the daily supply of water has been raised from 69,500 to 75,000 gallons; eight additional hydrants were provided; the water service was extended to the Tumsang and Bhootea bustees, to the native town, and to the slaughter-house at a cost of Rs. 8,057; and an auxiliary line, with pipes, was laid from the reservoir to chowrastha to guard against damages to the main pipes during the rains. The Darjiling water service was also extended to the *Kurseong* town at a cost of Rs. 2,465. In the *Dacca* town the tunnels and filter beds of the water-works, which permitted leakage, were improved at a cost of Rs. 2,632. The project for the supply of filtered water to the *Bhagulpore* town, referred to in the Report for 1882, was submitted to Government for sanction at the close of the year under review. In the *English Bazar* town in Maldah the water-supply arrangements were improved by re-digging

In the Towns.

and cleaning eight large tanks in parts of the town away from the river, which had almost dried up owing to scanty rainfall, and providing the four best of them with masonry ghâts for the convenience of the public. It is much to be regretted that the Commissioners of *Cuttack* negatived an important project, which had for its object the introduction of purer water from the river taken off at Naraji, a point above the town, where it is dammed by the irrigation weir. The present supply is from wells and is bad.

In the Districts.

201. In the *Hughli* district water was brought down through the Kana Nuddi from the Damuda to the Saruswati river. In former years this channel consisted in the dry season of a succession of filthy and stagnant pools; it now represents a flowing stream, which, it is believed, must exercise a beneficial effect on the health of the densely populated villages on its banks, by affording a purer supply of water, and, perhaps, by improving the sub-soil drainage of a large tract of the country. Some reservoirs for the storage of water were constructed in different parts of the *Sonthal Pergunnahs* district.

202. **Bustees.**—The Rishra bustee in the *Serampore* town, belonging to Government, which was in a disgraceful condition, was leased to the owners of the Hastings Jute Mills, who have improved it considerably by levelling the ground, constructing long lines of huts for their workmen with open compounds and broad roads, and providing public latrines, good tanks, &c. The Champdani bustee, which was in a very insanitary condition, and where cholera prevailed severely in 1882, having been accidently burnt, was similarly improved by the Manager of the mill situated therein, who has, moreover, constructed a covered filter in which the condensed water of the mill is filtered and then supplied to the workmen. In the *Suburbs of Calcutta* Malie Bustee was reclaimed and satisfactorily improved at a cost of Rs. 1,110, and similar improvements were effected in the *Howrah* Municipality at a cost of Rs. 1,130.

203. **Medical Relief.**—In *Monghyr* the dispensary—the gift of Mr. Dear —referred to in the Report for 1882, was completed and occupied during the year under review. Additional accommodation was provided in it by the construction of three upper rooms for the use of natives of a better class than those who usually resort to charitable dispensaries, and of a ward, at a distance from the hospital, for moribund cases, or cases which require to be isolated. The whole cost of the undertaking was Rs. 31,000. In Ulipur in *Rungpore* a hospital was erected by Moharani Surnomai Dassia. A contagious disease hospital was constructed in *Purulia* in Manbhum. The Eden Sanitarium in the *Darjiling* Municipallty was opened in April 1883. This is semi-private institution for paying patients.

Condition of the Calcutta foreshore.

204. *Port of Calcutta.*—It was reported that cleanliness was fairly maintained throughout the year at all points of the river bank on the Calcutta side, except that the khal, which passes through the premises of the ex-King of Oudh, discharged into the river the drainage and, at times, much filth which it brings down from the interior; and that sewage was again being discharged into the river from the flushing inlet at the Port Commissioners' jetties. The attention of the authorities concerned having been called to these defects, an improvement was effected with regard to the first-named nuisance, and a stop put to the second.

Public latrines on the Calcutta foreshore.

205. The two new latrines constructed last year by the Port Commissioners at the Bagbazar and Mohuntory Ghâts could not be brought into use for want of water. Another latrine was put up on the bank of Tolly's Nullah at its entrance below Hastings' Bridge—a point where there is a large traffic—but, although finished, it was not opened by the end of this year. It is under contemplation to erect another latrine near Schalch's wharf. When this one is constructed, there will be five latrines on the river bank above bridge; but the Health Officer suggests that these should be supplemented by others on the town side of the Strand Bank road, to the provision of which the attention of the Corporation was drawn in the Government Resolution on the Report for 1880, but as yet without effect.

206. The state of the bank on the Howrah side of the river is stated to have been satisfactory during the year. The embankment, which is being constructed on this side by the Port Commissioners, will, it is believed, assist in improving the conservancy of the bank; but the Health Officer mentions that latrine accommodation should be provided for those who will use this embankment.

Condition of the Howrah foreshore.

Corpses and Carcasses in the River.

207. There was nothing to complain about under this head.

Water-supply to the Shipping.

208. In this matter also no complaints were received from the shipping. The water-boats were frequently inspected and found to be in a clean condition. The crews of the native passenger boats at Prinsep's Ghât petitioned for a hydrant to be set up at the ghât, so that they may use the filtered water instead of the foul river water which they believed was unwholesome and productive of bowel-complaints. They were informed by the Chairman of the Calcutta Municipal Corporation that their request would be considered after the extension of the water-supply scheme, now under contemplation, shall have been effected.

Quarantine.

209. Quarantine for cholera against arrivals from Batavia and Sumatra was withdrawn in May, after having remained in force since July 1882. During this period no vessel from these ports was found to have had cholera on board. A pilgrim vessel (steamer) arriving with 584 pilgrims from Jeddah, and having three cases of small-pox, was cleansed and disinfected. The Health Officer has, in his report, discussed, at length, the question of quarantine and the importation of cholera into Egypt and Europe from India, as ventilated by the public press and some distinguished sanitary authorities in France. His observations are now before Government.

MISCELLANEOUS SANITARY OPERATIONS DURING THE YEAR.

Extension of Sanitary Laws.

210. The Bengal Municipal Act V (B.C.) of 1876 (Chapters I, II and V) was introduced into the towns of *Bali* in Howrah, *Jamalpore* in Monghyr, *Kotchandpur* in Jessore, *Perozpur* and the villages of *Massimpore* and *Krishnagur* in Backergunge, and *Shahibgunge* and the adjoining villages of old Shahibgunge, in the Sonthal Pergunnahs. Part VII of the same law was enforced in its entirety in the towns of *Jamalpore* in Monghyr and *Moheshpore* in Nuddea, and in part in the towns of *Goberdanga* in the 24-Pergunnahs (sections 235 to 255, 273 to 285 and 292 to 294), *Jessore* (sections 256 to 263), and *Hazaribagh* (sections 285 to 294); and Part IX was brought into operation in the *Burdwan* and *Dacca* towns. Bye-laws, framed under this Act, were brought into operation in the towns of *Krishnaghur* in Nuddea, *Berhampore* (additional) in Murshidabad, *Suburbs of Calcutta* (revised), *Darjiling* (additional), *Rampore Beauleah* (additional) in Rajshahye, *Faridpore* (additional), and *Bhagulpore* (additional).

Act VI (B.C.) of 1878, empowering the Commissioners of the first class Municipalities to control public and private latrines and to levy a fee for supervising the latter, was brought into operation in mohullas Goaltooly, Charghatta, Koolibunda and Soojanbas in *Hughli* town, in a further portion of the *Howrah* town, in ward V of *Krishnaghur* in Nuddea, in mohullas Meahpara, Gunnukpara, Kumarpara, Foodkipara, Rampore Bazar, Sagurpara and Sukerchuck in *Rampore Beauleah* in Rajshahye, and in *Patna* for the second time.

Act II (B.C.) of 1879, amending the Poori Lodging-house Act IV (B.C.) of 1871, was extended to thanas *Dantun* and *Garbetta* in Midnapore, and *Ranigunge* in Burdwan.

The places to which Act IV (B.C.) of 1873, rendering registration of births and deaths compulsory, were extended are mentioned in section V of this Report, and those in which Act IV (B.C.) of 1865, prohibiting the practice of inoculation, and Act V (B.C.) of 1880, rendering vaccination compulsory, were brought into operation, in section VII.

The following enactments, bearing on sanitation, were passed during this year.

Act V (I.C.) of 1883, relating to the Indian Merchant Shipping. The powers which this law confers on the Health Officer of the Port of Calcutta have been mentioned in the Report for 1882.

Act VII (I.C.) of 1883, an Act amending the Native Passenger Ships Act of 1876. This law provides, among other matters, regulations relating to overcrowding of passengers, carrying of a Medical Officer in certain cases, granting of Bills of Health, and the medical inspection of passengers and the detention of those found suffering from any dangerous or contagious disease.

During the year now current, Act I (B.C.) of 1884, amending further the Poori Lodging-house Act of 1871, and Act III (B.C.) of 1884, revising the law (Act V (B.C.) of 1876) relating to Municipalities in Bengal, were passed. The latter enactment, an important one, is to be enforced from the 1st of August 1884.

Importance of providing certain Riparian Towns with a pure Water-supply.

211. The question of providing a pure drinking water-supply for the riparian towns* between Howrah and Serampore calls for more than a passing notice in a sanitary point of view. The Government has taken up the subject, and has asked the Howrah Municipality to devise a scheme which will be common to all these towns, and it now depends on the Commissioners of that Municipality to bring the proposition to the desired issue. The drinking water for these towns is taken chiefly from the river and tanks. The latter, in many cases, is subject to much contamination and is full of organic impurities, the water being little better than sewage in solution. The river water, although superior in quality, is still polluted to a degree detrimental to health. Howrah has well nigh experienced a water famine, caused by the deficient rainfall of 1883 followed by drying up of the tanks. This was warded off by conveying river water and the condensed water of the mills into the tanks in the town. The trade reports show that these towns, forming a long line of suburbs commencing at Howrah, are not only commercially associated with each other, but have also an intimate connection with Calcutta, the health of which they must, from proximity, sensibly affect. Howrah is only second among mofussil municipalities in Bengal with regard to extent of area, population and fiscal importance. It contains large and important mills, factories and dockyards, where a large number of artizans, coolies and other labourers from the rural tracts and from Calcutta are employed. It is the terminus of the East Indian Railway, and in this connection it is largely resorted to daily—nay, I may say hourly—by people from Calcutta. It, moreover, sends daily a large number of clerks and labourers to Calcutta, is the suburban residence of many people of Calcutta, and contains a European population numbering 1,776. Its trade in agricultural and other produce is important. Shibpore is a flourishing little town inhabited to a great extent by clerks who are employed in Government and mercantile offices in Calcutta. It has also a market, where the industries of many places are available, to which a large number of purchasers is attracted. The Bali town has a similar market and a large paper mill. Utterpara is a large and thriving village immediately south of Bali, and contains a small but well conducted Municipality. Kotrung is a large village situated on the banks of the Hughli. It is noted for its brick manufacture, a portion of which is supplied to Calcutta. The Calcutta Municipal Corporation also manufacture their bricks here. Serampore, situated on the East Indian Railway, is a considerable town, including several villages, and occupies a prominent place in a commercial point of view owing to its great trade in jute. It contains a number of jute mills and also a paper mill. The car festival of Juggernath, which is conducted in the villages of Mohesh and Bullubpore in its suburbs, with great pomp, attracts a large concourse of people from many places, including Calcutta. All these towns, moreover, either by forming railway stations, or by being situated in proximity to them, are more or less associated with the railway-borne traffic.

* Howrah including Shibpore and Golabari, Bali, Utterpara, Kotrung, and Serampore.

Another important point connected with this question is that the Howrah district and the Serampore sub-division are very densely populated, considerably more so than any other district in Bengal proper, Calcutta and its Suburbs excepted; for while in the districts the population per square mile ranges from 771·78 in the 24-Pergunnahs to 126·53 in Darjiling, in Howrah the incidence of population to the square mile is 1,334·83, and in Serampore 1,026·11.

Turning now to the prevalence of cholera and fever in these towns, which are materially influenced by the water used by the sufferers, chiefly the former malady, we find from the figures marginally furnished, exhibiting the death-rates from these causes during the five years 1879 to 1883, that the mortality from cholera has steadily increased, and is at present lamentably high; and that, in recent years, there has been a decline in fatality from fever; but, in connection with this diminution, it should not be forgotten that during the years anterior to 1882 the areas in question, particularly Serampore, were affected by the disease in a severely epidemic form.

Districts.	Towns.	Population.	Ratio of Deaths per 1,000 of Population.									
			Cholera.					Fevers.				
			1883.	1882.	1881.	1880.	1879.	1883.	1882.	1881.	1880.	1879.
Serampore.	Serampore ...	26,496	4·90	10·83	6·67	1·06	2·03	12·86	17·81	15·62	16·37	18·90
	Kotrung	5,747	7·13	7·30	8·87	2·95	7·30	6·96	10·26	18·96	15·13	16·70
	Utterpara ..	5,510	8·53	7·25	2·90	3·62	3·08	7·25	7·25	8·89	9·25	11·25
Howrah.	Bali	14,815	6·54	7·22	5·73	4·31	3·71	9·51	17·34	20·24	20·38	15·45
	Howrah, excluding Bali.	90,813	6·12	6·17	4·14	1·68	3·76	8·72	8·93	13·98	13·87	10·96

I have thus emphasized the above question, because a good and pure water-supply for drinking and domestic use is a matter of prime and vital importance, and occupies a prominent position in sanitation in connection with the prevalence and fatality of cholera.

Dum-Dum should be supplied with a Water-service.

212. As Barrackpore with its cantonments is now enjoying the benefits of a pure water-supply by the extension to it of the Calcutta scheme, it appears reasonable that Dum-Dum, only 10 miles distant from it, should also partake of this advantage. Troops are always located in the cantonment of Dum-Dum, but, I believe, the only source from which they derive their drinking water is the Digla tank. There were differences of opinion as to whether the water of this tank did possess the purity ascribed to it, and Dr. deFeback was invited to inspect and report on it; but although he did not furnish this report, owing to the order of the Government of India contained in Resolution, Home Department, No. 128—140, dated 10th September 1868, desiring the Sanitary Commissioner to abstain from interfering with any matter connected with military administration, there is a record of his opinion in this office, from which it is seen that this tank is not protected from defilement by human and cattle ordure, from percolation or washing into it of surface impurities, and from other causes. On analysis it was found that the water of this tank gave indications of probable sewage contamination.

Intra-mural and intra-village interments.

213. This very reprehensible practice, which pollutes the soil and the water-supply in proximity to it, is carried on to a very large extent in the villages in the Province. The village Sanitary Reports submitted by the Vaccination Department during this year, which, however, do not cover the whole area, disclose its existence in the villages situated in the districts noted in the margin.

Districts.	Number of villages.	Districts.	Number of villages.
Burdwan	3	Rajshahye	74
Bankura	1	Rungpore	17
Birbhum	26	Bogra	28
Midnapore	8	Darjiling	8
Hughli	1	Julpaiguri	14
Howrah	10	Dacca	5
24-Pergunnahs	44	Noakhalli	11
Nuddea	207	Bhagulpore	2
Jessore	30	Monghyr	7
Murshidabad	72	Maldah	17
Khulna	16	Manbhum	5

It is much to be regretted that it is not easy to prohibit this practice for various reasons, the chief being that the villagers generally cannot recognize the benefits of altering a time-honoured institution; that, in the majority of instances, cultivation is brought up to the very confines of the village, thus leaving no land available for a common burial ground; and that the people dislike to bury in land subject to annual inundation. But it is astonishing to find, from the Annual Sanitary Reports, that the practice is still prevalent in the urban areas noted in the margin.

Pubna.	Serajgunge.
Khulna.	Noakhalli.
Sherpore.	Bohar.
Barrh.	

In the case of the Pubna Municipality the suggestion to suppress the practice was made so long ago as November 1880 when I inspected

it, and is still forming a subject of correspondence. The Commissioner of the Rajshahye Division has given me every assistance in his power, but the Municipal Commissioners seem very difficult to influence. Legislation to enable village communities to acquire land for cemeteries seems the first step towards checking this very widespread evil.

214. Allied to the above question is that regarding the casting of dead bodies into rivers and other sources of water-supply. The reports of the Civil Surgeons disclose that this practice is in vogue in the towns situated in the districts named in the margin. I have also no doubt that it is carried on in several second class Municipalities. From personal enquiries I have found it an almost universal practice in the district of Nuddea, where cholera is severely prevalent now, and it exists also in other districts, it being a common thing for the poor to partially cremate bodies and then consign them to the river. While there is no reason whatever why this great evil should not absolutely cease in urban areas, the difficulties attending its prohibition in villages will be apparent from the case of the Hatika village in Nuddea which was specially brought to notice, and on which action was taken during the year under review. One of the Deputy Superintendents of Vaccination, Metropolitan Circles, brought to notice that corpses with heavy weights attached to them were thrown into the river Howlee in thannah Chuadanga in Nuddea, whereby the health of village Hatika, situated on the banks of that river, was endangered. The question was submitted to Government with the recommendation that the offence be seriously dealt with. The Commissioner of the Division, to whom the subject was referred, stated, on the report of the Magistrate, that the practice was general among the poor (especially in times of great mortality), who cannot afford the expense of cremation, and that it was difficult to put an entire stop to it, notwithstanding that notices prohibiting the practice are issued and, when possible, prosecutions for breaches are instituted, inasmuch as the corpse is generally thrown into the river at night, and becomes decomposed or destroyed beyond recognition. He suggested that the chowkidars and punchayets be directed, in reporting a death in their village to the Police, to state how the body had been disposed of, and also to ascertain that it has actually not been thrown into the river, so that the friends of the deceased, knowing that an account of the corpse would be demanded and enquiry made, will not take the risk of throwing it into the river.

Throwing of Corpses into Rivers, &c.

Khulna.
Noakhalli.
Patna (only Barrh).

215. During the year a circular was issued to the Commissioners of all the first and second class Municipalities, specially recommending them to adopt Major Ramsay's Patent Portable Land Manuring Privy, which was found by Dr. deFabeck to work admirable in some municipalities, its special features being "the immediate and complete disposal of the excreta, both solid and liquid, into the soil, without the intermediary use of carts or manipulation of any description, by which the nuisance of public deportation is avoided, a possible source of infection avoided, and a considerable saving of expense acquired;" and also in comparison with many other processes, "by far the most efficient, the one most suited to the habits and prejudices of natives, the most cleanly, and the one solving, in the most satisfactory manner possible, the vexed question of the disposal of sewage." The replies elicited by this circular indicated that, excluding Patna, Barrh, Futuha and Monghyr, where the privy had already been brought into use, in only the Bettiah Municipality it was adopted experimentally, that Jessore consented to adopt it, that at Jamalpore a similar privy was in use, that in Chupra one known as D'Abrue's patent had been adopted; that 16 Municipalities proposed to adopt it after ascertaining its cost, or after provision for the required expenditure had been made in the ensuing budget, &c., and that, excluding a few from which no replies had been received, the rest could not adopt it, owing chiefly to want of space, the towns being crowded; or to paucity of funds, &c.

Major Ramsay's Patent Portable Land Manuring Privy.

216. With regard to the investigation which was set on foot by Dr. deFabeck in relation to the utilization, for drinking purposes, of the waste water which had

Utilization of condensed Water of mills for drinking purposes.

been exposed to a high temperature while passing through the condensers of jute mills, I beg to state that of the 21 proprietors of such mills, situated in Howrah, Serampore and 24-Pergunnahs, who were addressed on the subject, only one, viz. the poprietors of the Champdanni Jute Mill, has furnished a reply. I regret, therefore, that I am not in a position at present to submit the report on the subject called for in paragraph 11 of the Government Resolution on the Annual Report of this Department for the year 1882.

Characteristics of Epidemic Cholera.

217. In July a communication was received, through Government, from Her Majesty's Consul at Alexandria, forwarding copy of a letter from Dr. Hassan Pasha Mahmond, the President of the Maritime and Quarantine Sanitary Board of Egypt, to Mr. Mieville, the British Delegate to that Board, requesting to be supplied with a weekly return of deaths from cholera in Calcutta, and desiring that, as notwithstanding that the mortality from cholera is high, the Medical authorities in India still certify that the disease is not epidemic, an explanation be given as to the conditions which, in their opinion, constitute cholera epidemics. The Government requiring a report on the latter point, the Health Officer of Calcutta, Dr. K. McLeod, to whom the request was referred, replied that the subject had been fully considered by himself and Drs. Coates and Birch as Members of the Cholera Board in Calcutta, and that they had arrived at the following conclusions as to the characteristics of an epidemic. "That it spreads from place to place exhibiting the following phenomena:—

(*a.*)—"Invasion of virgin area. (*b.*)—Somewhat sudden increase, limited duration, and gradual disappearance of the disease. (*c.*)—A marked tendency of grouping of cases. (*d.*)—Alternate periods of prevalence and total immunity in the affected area.

"That with regard to cholera in Calcutta, it increases and declines gradually at certain seasons with unfailing regularity, and at its worst it is scattered, sporadic cases appearing in a discrete way throughout the town, grouping of cases being the exception. Accordingly, cholera in Calcutta does not present the features of an epidemic, but, typically, of an endemic disease."

Reports on the sanitary condition of Emigration Depôts.

218. The sanitary condition of the Calcutta and Goalundo emigration depôts, and the health of the coolies, are stated by the Medical Inspectors of those institutions, whose reports have been submitted to Government, to have been on the whole good, and the quantity and quality of the diet unobjectionable.

Sanitation promoted by district officers and others.

219. Mr. Anderson, the Magistrate of *Bankura*, continued to instil into the minds of the people the urgent necessity of maintaining ordinary sanitation in the way of preserving the drinking-water pure and removing insanitary surroundings. But in some instances his efforts did not meet with complete success, due partly to the poverty of the people and partly to inattention on the part of the officers entrusted with the supervision of the proposed work. Mr. Sharp, the Magistrate of Faridpore, paid great attention to removal of jungle, jute soaking, drinking and household water-supply, &c. During his tours he took along with him an overseer, a sircar and 6 coolies, by means of whom, he, under his personal supervision, improved or repaired village roads, ghats, short khals near the great rivers, &c., corrected defects in water-ways, and performed various other works. He found this plan useful, easily practicable and successful. He also adopted careful arrangements for the arrest of the spread of cholera. *Monghyr.*—Mr. Dear presented a new hospital, containing ample accommodation, to the Monghyr Municipality, which cost him over Rs. 31,000. *Sonthal Pergunnahs.*—Mr. S. S. Jones, the Sub-Divisional Officer of Deoghur, raised a sum of Rs. 1,500 by subscription and employed it in cleaning and improving the water-supply of, and in opening out several roads in, the Deoghur town. *Cuttack.*—Babu Baidanath Panda, Rai Bahadoor, kept up a dispensary in Dharmasala at his own cost.

SECTION X.

PERSONAL PROCEEDINGS.

PROCEEDINGS OF THE SANITARY COMMISSIONER.

Officers in charge of the Office during the year.

220. Dr. deFabeck was in charge of this office the from beginning of the year to the 15th December, on which date I resumed charge.

Places visited and inspected during the year with results.

By Dr. deFabeck.

Towns.		Dispensaries.	
Howrah	... In January.	Buxar	... In March.

Darjiling	... " November.		

By Dr. Wood, Deputy Sanitary Commissioner, Darjiling Circle.

Towns.

Julpaiguri Union in November and again in December.
Sherpur Municipality in December.

221. The eight towns and five dispensaries named in the margin were inspected during the year, two of the former by Dr. Wood, Deputy Sanitary Commissioner, Darjiling Circle, and the remainder of the towns and the dispensaries by Dr. deFabeck. During 1882 the conditions of nine towns and two dispensaries were enquired into. Dr. deFabeck was of opinion that the services of the Deputy Sanitary Commissioners should be utilized in instituting, while on circuit duty connected with vaccination, enquiries into the condition of the towns and rural areas laying in the direction of their tours, which are notably unhealthy, and submitting special and detailed reports regarding them in much the same way as is done by the Sanitary Commissioner; and, as a beginning, he desired Dr. Wood to carry out this intention. Dr. Wood has visited several other places than the two named in the margin, and submitted reports thereon: but as these reports belong to the records of the year now current, an account of them will be furnished in the Annual Report of that year. Of the towns visited during the year under review, the condition of Howrah, Serampore and Darjiling may be said to be fairly satisfactory. Much was done during the year for the improvement of the sanitation of the Darjiling Sanitarium by rectifying several of the defects noticed at the inspection in 1882. The rest of the towns exhibit many grave transgressions against sanitary laws, the condition of Sherpore, Julpaiguri and Buxar, demanding urgent attention, as will be seen from the abstracts of the Inspection Reports given in Appendix IV to this Report.

Lectures on Hygiene delivered at the Medical College.

222. In the capacity of Professor of Hygiene in the Medical College, Dr. deFabeck delivered 12 lectures on the subject to 26 students; and I delivered 8 lectures to finish the course.

Reports on sanitary questions submitted to Government.

223. Only two reports of this nature were called for and submitted to Government during the year. One of them referred to the revision of the diet scale for lascar crews, consequent on the law relating to Merchant Seamen having been amended by Act V (I.C.) of 1883. The two points which demanded consideration in connection with this question were, to what extent the existing diet scale should be revised so as to form a maximum scale for this class of seamen, and what quantity of biscuits and sugar should be allowed in lieu of rice and dâl in bad weather. Dr. deFabeck replied with regard to the first point that, if the flour in the existing scale were increased from 6 to 10 ounces, and the dâl from 4 to 6 ounces, the scale would be sufficient for the class of seamen in question; and with regard to the second point, that 6½ ounces of biscuits and two ounces of sugar, in addition to the quantity provided in the existing scale, should be allowed in bad weather, instead of the rice and dâl. The second question involved the consideration by Dr. deFabeck of a set of instructions framed by the Civil Surgeon of Cuttack, to be adopted for preventing the spread of cholera during epidemic seasons. Dr. deFabeck condemned them as injudicious and unworthy of serious recognition, principally because they did not provide for the means which take the first place in combating the disease, viz. the most efficient maintenance of sanitary rules and practice, and the constant and careful preservation of localities with their populations in the best sanitary condition.

224. The Health Officer of the Port of Calcutta performed his duties energetically and in a very satisfactory and commendable manner. The number of inward and outward-bound vessels inspected by him during the year under review was 815 and 649 respectively, aggregating 1,464 vessels, against 1,367 during the preceding year, distributed as shown in the table in the margin, which also exhibits the number of seamen who arrived in, and departed from, the Port. The corresponding numbers of seamen in 1882 were—Europeans on inward-bound vessels 19,764, and on outward-bound vessels 14,993, representing a total of 34,757; and natives in the former class of vessels 4,364, and in the latter class 2,383, aggregating 6,747. The comparison indicates a commendable increase in the inspection work of the year. In addition, enquiry was instituted into the health and treatment of 4,783 against 4,853 lascars who returned into Port from foreign voyages. The results of this enquiry have been submitted in paragraph 30 of this Report.

225. The Health Officer observes that no legal enactment exists under which powers are given to any authority to compel the disinfection of vessels which are known to have had infectious diseases on board previous to their arrival in this Port, or of vessels which have had cholera during their stay in Calcutta prior to their departure. He notes that the masters of vessels are of opinion that they have no option in the matter under sections 194 to 197 of the Merchant Shipping Act, but that, on the contrary, they are responsible for the effects of the seamen; and that they are known to take away the wearing apparel, to sea and, if the owner thereof dies, to sell it by public auction on board, and thus distribute it through the ship. He instances cases in which vessels have arrived in Port thus infected, and he suggests that some legal provision should be made to deal with infection on board of vessels in Port in the same manner as in premises on shore.

Absence of legal powers for disinfecting vessels, a sanitary want.

226. The Native Sanitary Inspector of the Port of Calcutta appears to have discharged his duties with commendable zeal and satisfactorily. To enable him to carry on these duties in a regular and systematic manner, the river has been divided into six sections, one of which he goes over daily in alternation, visiting the passenger and cargo-boats and all descriptions of native craft. He ascertains what sickness exists on board, and affords information to the crews of the situation of the nearest hospitals, advises the persons in charge to send their sick to them, and, in cases of cholera or of infectious disease, obtains the assistance of the Police for their removal to hospital. He inspects the foreshore of the river and the conservancy arrangements which obtain at it, bringing to the notice of the Health Officer any defects he may discover. He also informs the Water Police of the presence within Port limits of foul cargo-boats requiring cleansing. The following is a summary of the amount of work which was performed by him during the year:—

PROCEEDINGS OF THE NATIVE SANITARY INSPECTOR OF THE PORT OF CALCUTTA.

12,830 boats inspected, of which 542 were found in a filthy condition.
390 complaints made to the Police.
327 persons found sick on board of boats.
351 times latrines were inspected, of which 25 were found in a filthy condition.
79 Police water-boats inspected.

227. The subjoined table exhibits the number of villages visited by the officers of the Vaccination Department. Compared with the returns of the preceding year, advances are observable in the inspections of all the Superintendents and Deputy Superintendents, excepting the Deputy Superintendent of the Sonthal Pergunnahs Circle, who alone retrograded in his inspections, and that to the extent of more

PROCEEDINGS OF THE OFFICERS OF THE VACCINATION DEPARTMENT EMPLOYED ON SANITARY DUTY.

Number of villages visited.

than half the number of the inspections of 1882. Relatively considered, the increase in the inspections of the Superintendents of the Orissa, Ranchi, Metropolitan and Behar Circles, and of the Deputy Superintendents of the Metropolitan Circles, take pre-eminence in the order noted, while those of the Superintendents of the Darjiling and Eastern Bengal Circles and of the Deputy Superintendents of the Darjiling, Ranchi and Eastern Bengal Circles, while exhibiting improvement, cannot be considered satisfactory. It should, however, be noted that the diaries and special reports submitted by the Darjiling Superintendent indicate that he had exhibited superior and exhaustive care and attention in all his inspections. I do not comment on the work of the Inspectors, Native Superintendents and Inspecting Head Vaccinators, as these officers, excepting those attached to the Darjiling and Sonthal Pergunnahs Circles, were not at liberty to perform sanitary work during this year, inasmuch as Rule IX of the "Rules for the guidance of the officers of the Vaccination Department with reference to their vaccination and sanitary inspections,' prohibits their doing so until they shall have passed a satisfactory examination in elementary Hygiene. This examination the majority of these officers underwent during the year, and those of them who have passed satisfactorily will undertake sanitary work during the next working season:—

* The Superintendent being the Civil Surgeon of the district and stationed at its head-quarters, was unable to perform Sanitary inspection work.

228. A *resumé* of the observations relating to the health conditions of the villages made by the Deputy Sanitary Commissioners during their sanitary inspections is subjoined:—

Health conditions of the Villages inspected.

Metropolitan Circles.—Dr. K. P. Guptu. Water-supply.—Excluding the cases in which people live near rivers or fresh-water streams, want of good drinking water is a very common complaint, even, very often, in many places which are actually inundated during the rains. The people are not altogether careless about the water they drink, as they obtain the best which may be available. The Deputy Sanitary Commissioner advised the people to clean their tanks, and reserve some of them solely for drinking purposes, and always to boil and filter their drinking-water, specially during cholera epidemics; and he suggests that when the owners of tanks cannot undertake the cleaning of their tanks through poverty, it should be done by the zemindars or the Road Cess Department; that in order to obviate the high cost of digging or cleaning large tanks, wells should be sunk; and that tanks should be cleared of all trees and plants growing on their sides. Defœcation and Night Soil.—As a rule Bengal villages have no pucka privies, and the people resort to the jungles, road and tank sides, river-banks, &c., for defœcation, and think nothing of committing nuisances anywhere. Dr. Guptu asserts that this practice is opposed to the primitive Hindu laws of health, prescribed by *Manu*, which directs every man to arise be-times and take his bow and arrow, to go to the outskirts of his place of residence, thence to shoot an arrow, to dig a hole where the arrow alights, to defœcate in it, and to cover the excreta with dry earth. Disposal of the Dead.—The Mussulmans, as a rule, bury their dead within private enclosures even in several villages where burial grounds exist. The Hindus cremate on the banks of the rivers, streams, khals or tanks; in some cases incompletely, the unconsumed parts being thrown into the

water. The Baishnahs and Yogees bury their dead. The throwing of dead bodies into rivers is not uncommon. Intra-village interments and the consigning of corpses, or parts thereof, to water reservoirs cannot be sufficiently condemned. HOUSES AND ROADS.—Houses, with a few exceptions, are all *kutcha*, but the construction varies in different districts. In Burdwan, Birbhum, Bankura, Midnapur, Hughli, Howrah, and the greater part of the 24-Pergunnahs and South Nuddea, the dwellings are constructed of mud walls with roof of straw over a bamboo frame. The floor is of mud, but raised pretty high, and the ventilation is sufficient, although the doors and windows are neither large in size nor sufficient in number; but there is an opening under the eaves for the exit of heated air, while the cold enters by the door. In parts of Murshidabad, Nuddea, Jessore, Khulna, and the south-eastern parts of 24-Pergunnahs the walls of houses are of durmas or mats, or split bamboos, or wattle-and-dab. The ventilation is free—two free for protection against cold winds. The floor being *lepoed* every morning, is more or less damp, although very clean. Few villages have metalled roads; several have good *kutcha* roads; but the great majority have no roads at all but narrow and winding path-ways. DRAINAGE.—The natural drainage of Birbhum, the Ranigunge sub-division in Burdwan, Bankura excepting thannahs Kotulpore and Indas, is good, as the country being undulating, all excess rain water which is not required for cultivation easily runs into the nearest stream, or collects in lagoons, or small streams. The drainage in Howrah, Hughli, Nuddea, Burdwan, Bankura, Birbhum and 24-Pergunnahs is stated to be obstructed to a certain extent by the Railway. Few villages possess *pucka* drains—some have shallow cuttings for carrying off rain water. FOOD-SUPPLY.—This consists of rice, dall or pulse of various kinds, fish, vegetables, milk, ghee, curds, &c., &c., rice forming the staple diet. Wheaten flour is used by the well-to-do in the shape of *chapatis* (hand-bread), baked or fried in ghee. Fish is the only animal food commonly used, goats and kids being consumed very rarely, while fowls and mutton, and even beef, are eaten only by the Mahomedans and those holding heterodox opinions. The lower caste Hindus eat swine, while the Dhangurs and Bowries eat dead rats, snakes and cats. GENERAL HEALTH.—While *fever* was generally prevalent all over the circle, the following places were found to be comparatively free from it, deficient rainfall being assigned as the general cause of the exemption:—

The Sudder sub-division, parts of the Barripore sub-division and the Sunderbun portion of the 24-Pergunnahs. Magura and part of Jhenida in Jessore. The Khulna district generally, which is intersected by numerous rivers and creeks. Almost the whole of the Howrah district as usual.

It is moreover reported that the following places which had suffered epidemically in former years ceased to do so this year:—

The Nuddea district, which had suffered since 1880, excepting the Kushtia sub-division.

The Hughli district, in which several villages had been depopulated more or less.

The Burdwan district, which had suffered from 1870 to 1875.

The Birbhum and Bankura districts, which had been alarmingly invaded, and

The Bongong sub-division in Jessore, which had suffered in common with Nuddea when it formed a portion of that district.

On the other hand the following places suffered more or less virulently from the malady:—

The Baraset sub-division and some parts of the Bussirhat and Barripore sub-divisions in the 24-Pergunnahs.

The town of Jessore, referred to the stagnant Bhyrub river, no action having yet been taken with regard to the proposition to clear and convert it into a flowing stream. Dr. Guptu suggests that the Municipality should keep it free from weeds and moss—which can be done at a small cost.

Some villages in Baitaghata in Khulna.

The Kushtia sub-division in Nuddea, which hitherto escaped the epidemic phase of the disease, was virulently invaded this year.

The Berhampore civil station and some villages here and there in Murshidabad, which were hitherto free from the disease in its epidemic form.

Thannahs Jagatballabpore and Domjor in Howrah.

Thannas Anda and Bishenpore in Bankura.

Cholera was conspicuously fatal in—

Thannahs Khulna and Bagirhat in Khulna.

Thannahs Damurhuda, Chuadanga and Chagda in Nuddea.

The Ulubaria sub-division in Howrah.

Village Sharghat in thannah Goghat in Hughli.

Small-pox prevailed with noticeable severity in—

Several villages in thannahs Goas, Jelinghi and Bhagwangola in Murshidabad. These villages are occupied by a large number of Ferazees, who persistently refuse vaccination.

Thannah Ketugram in Burdwan.

Darjiling Circle.—Dr. J. J. Wood, Deputy Sanitary Commissioner. DWELLINGS.—These in the plains are nearly all situated in unhealthy neighbourhoods, that is near rice fields, or dead water in the shape of marshes, bheels or jungle. They are constructed generally of wattle-and-dab, or have earthen walls. The roofs are thatched. They are often too near one another, with insufficient ventilation and perflation. Although the floors are commonly raised on earthen plinths one or two feet high, they are, as a rule, damp. The rooms are crowded by night. Some of the houses have overhanging roofs and verandahs to keep out the rain. CONSERVANCY.—Is conspicuous by absence, except in towns, where also it is not quite satisfactory. The village path-ways, which generally represent roads, are resorted to for defœcation; sweepings and excreta are not removed to a distance; the surroundings of the houses are in filthy condition; cattle are usually crowded in studs. WATER-SUPPLY.—This varies widely, but is never above suspicion. DISPOSAL OF THE DEAD.—Dead bodies are too often burnt near streams, or buried too near houses, or on the catch-water area of tanks. GENERAL HEALTH.—The health standard of the year 1883-84 was believed to be better than the average. *Cholera* was noticeably severe in the Darjiling Terai, whence a few case spread to the hills. *Small-pox* was not systematically reported, and it is suspected that many cases were not recorded. Most of the cases appeared in the rains in July and August, and the mortality was greatest in October. *Goitre*, *leprosy*, *rheumatism*, *chest-affections* and *dropsy* were noted here and there. SUGGESTIONS.—Dr. Wood suggests that the throwing of dead bodies into running streams should be more vigorously prohibited and a Government reward offered for the removal and burial or burning of such bodies as are found stranded in streams, and that a bhisti should accompany the coolies from Parbatipore on their journey to Assam, to supply them with clean water at the stations through which they pass, as they are much neglected in this respect.

Ranchi Circle.—Dr. Owen, Deputy Sanitary Commissioner, and Prosono Coomar Dey, Deputy Superintendent of Vaccination. VILLAGES.—The vast majority of these do not differ much from each other as regards their sanitary condition, which is not good in many respects. The Deputy Superintendent reports, that of the few villages visited by him only Raghunathpore and Pachamba had fairly good roads, in the others the roads were bad and some had no roads; and that artificial drainage was met with nowhere, the roads serving this purpose. CONSERVANCY.—No arrangements under this head were found to exist by the Deputy Superintendent in any of the villages visited by him. The town of Pachamba and the surroundings of the Bishengarh town were in an unclean and unsatisfactory condition. WATER-SUPPLY.—The drinking-water varied in quality, but in very few places could it be pronounced good or fit for use. Dr. Owen suggests the multiplication of wells to break the habit of resorting to tanks, which are promiscuously used. The water of the streams in Bishengarh town was found by the Deputy Superintendent to be contaminated by the throwing of corpses in them. This was brought to the notice of the Deputy Commissioner of Hazaribagh, with a recommendation for its cessation. FOOD-SUPPLY.—Hazaribagh and Lohardugga suffered from deficient food-supply, owing to failure of crops, but this did not seem to act adversely on the health of the people. As a rule they looked healthy, well nourished and contented. They said that they could get on well enough until the mohwa season, but if this crop failed, their condition would then be bad. REGISTRATION.—This was looked into by the Deputy Sanitary Commissioner in a large number of places;

and by the Deputy Superintendent of Vaccination in a few; and with a few exceptions, the deaths ascertained to have occurred in the villages agreed with the numbers recorded in the registers in the thannahs. ADVICE TO THE PEOPLE.—Wherever Dr. Owen went, he explained to the people the benefits of sanitation and cleanliness, and pointed out to the zemindars, village headmen, chowkidars, and others, what and where defects existed, and insisted on their being rectified. GENERAL HEALTH. The general health of the circle was, on the whole, good, no special prevalence of disease existing anywhere.

Sonthal Pergunnahs Circle.—Assistant Surgeon Probhode Chundra Bose, Deputy Superintendent. WATER-SUPPLY.—In the Sonthal Pergunnahs district the drinking-water supply was found to be seriously contaminated by the practice, extensively carried on, of incompletely burning corpses in the beds of rivers and letting the remains lie there. REGISTRATION.—The deaths occurring in the villages were ascertained at the time the people were collected together for the purpose of verification of vaccine operations performed on them, and the information afterwards compared with the thannah records. The result is not stated. ADVICE TO THE PEOPLE.—Instructions were given to the villagers as to the rectification of the defects found to exist in their villages with regard to their mode of living, housing of cattle, conservancy arrangements, reservation and preservation against pollution of the drinking-water supply, &c. GENERAL HEALTH.—This was found to be good everywere, except in a few villages in the western portion of Khagria outpost in thannah Gogri, where *fever* and *spleen* prevailed to an unusual extent. *Goitre* was also met with.

Eastern Bengal Circle.—Mr. Apothecary Lyons, Deputy Sanitary Commissioner.—This officer's report refers generally to the Dacca, Tipperah and Mymensing districts:—ADVICE TO THE PEOPLE.—In each village, hât and bazar visited, Mr. Lyons delivered "lengthy and earnest addresses on sanitary matters," pointed out defects, and made suitable and practical remedial suggestions. The Magisterial authorities were also made aware of the existence of these defects, and suggestions for their removal were submitted to them. Referring to the apathy generally evinced by the people with regard to sanitary reforms, Mr. Lyons makes the following practical and pointed observations:—"To remedy defects such as I have noticed, sanitary legislation of some sort to meet the requirements of rural dwellings is called for, if the physical welfare of the people is to be espoused. My observations teach me that the people, rich and poor, educated and uneducated, alike, cannot, or will not, actively be-stir themselves in bringing about sanitary reforms. Of this I have the most abundant and convincing proofs. Apathy and long habit combined are fatal to any real improvement taking place spontaneously from within the rural communities. All my hearers, of every condition in life, though seeming to be impressed with the desirability of village sanitary reform, and to admit the evils of the sanitary defects pointed out to them, nevertheless looked at the changes indicated in a half-hearted, helpless sort of way. Whilst discoursing with them, I am invariably met as follows by the acknowledged leaders of the village:—'I can clean my premises, but what of my neighbour's holding? I cannot compel him to clean his!' But say I, 'see the powerful moral effect of example, and the potent influence of consultative village meetings in view to adopting sanitary reforms.' The suggestion falls flat. The *universal verdict*, so far as I have been able to ascertain it, is, that no change can or will be effected without—strange to say it—Government help and interference! If this were said only by the poor and illiterate, there would still be hope, but alas! there is a consensus of opinion on this matter held by literate and illiterate, rich and poor. Wherever I suggested to pancheyets that it was expected that they should exert their influence and authority in introducing sanitary improvements, I was asked to grant them a *perwanna*, to enable them to enforce reforms, without which *no one* would heed them. Strange as it may look, it is none the less true that even the *owner* of a tank has not the moral courage, even if he has the will, to conserve it for drinking purposes alone. Fear of having his house burnt down, or being made the mark of the village, or of having vexatious charges preferred against him, deters him from making innovations against customs and practises that have the sanction of immemorial usage. To one who has studied and knows village life in Eastern Bengal as it is, these are real and not imaginary obstacles, and ones not to be overcome in

the ordinary way; therefore the venture will seldom, if ever, be made, and thus any hope of voluntary sanitary improvement will continue to stand at zero." REGISTRATION.—The usual village enquiries were made and comparison of the information with the thannah registers instituted. The result was seldom satisfactory: the discrepancies being many. But Mr. Lyons is not prepared to say that the chowkidars furnished defective or erroneous information at the thannahs. They may or may not have done so; but, on the other hand, he is disposed to believe that the information gleaned by him at the villages may not be free from error from various causes, such as defective memory of the informants, want of interest in the matter by them, &c. He thinks that nothing short of a special agency will secure reliable statistics. He notices that under a departmental Police order the thannah registers are destroyed after the close of each year, owing to which the events of November and December, ascertained by him in February and March, could not be verified at the thannahs. GENERAL HEALTH.—The general health of the people was found to be good on the whole. Fever of the intermittent type was prevalent, and a considerable number of the people had enlarged spleen. Colic and neuralgia were not uncommon. In a village near the river Megna in thannah Raipura in Dacca an outbreak of cholera, in a somewhat severe form, occurred. Mr. Lyons writes:—"The wonder to my mind is that the health of the people is as good as it is, and that they look as well as they do, seeing their almost indescribably filthy surroundings and unclean habits. It serves to teach me the wonderful adaptability of the human body and its functions to most adverse and adventitious circumstances, and to show that the *vis conservatrix cum medicatrix naturæ* asserts itself with extraordinary varying force according to the degree of habit of body—to put it in another way, one might say 'one man's meat is another man's poison.' "

Orissa Circle.—Mr. Assistant Apothecary, P. Veariah Naidu, Deputy Sanitary Commissioner. This officer visited the largest number of villages. The sanitary defects detected in them are, *mutatis mutandis*, identical in character to those pointed out by the other Deputy Sanitary Commissioners. They need not, therefore, with the exception of his description of the towns of Poori and Balasore and of the Tributary State of Moharbhanj, be reproduced here. The *Poori town* is situated on the shore of the Bay of Bengal, on a sandy plain. The ground in the centre of the town is lower than that of the outskirts. There are single and double storied pucca houses, and also mud ones. Sweepers are provided for the road and other sweepings. The night-soil is buried, and the other refuse is thrown on the sands near the Government school. The latter was reported to the Magistrate, who ordered the discontinuance of the practice. The offerings of food at the temple of Juggurnath are largely consumed by the people. The drinking-water is obtained from wells and tanks. The health of the people is good, except when the town is overcrowded by pilgrims during the festivals. The *Balasore* town is situated on high and open laterite ground on the banks of the Poolari. The people keep themselves and their dwellings clean. There are pucca and kutcha roads and lanes. The side-drains are kept clean. The night-soil and all other refuse is collected and removed to the outskrits of the town and buried. There are six pucca latrines in suitable localities, which, with the urinals, are kept clean. The streets are lighted with kerosine lamps. The dead are either buried or burnt. Drinking-water is obtained from wells and tanks, and the food-supply from markets, which are kept clean and tidy. *Moharbhanj* is situated on high ground between the rivers Surali and Poolari, and surrounded by dense jungle, which renders the place malarious. The inhabitants keep themselves very filthy. There are pucca and kutcha roads, and sweepers are employed by the State to keep the town and its surroundings clean and tidy. The gur (fort) of the Rajah, situated in Baripada, is kept neat and clean. ADVICE TO PEOPLE.—All the defects in sanitation traced were pointed out to the headmen of the villages, and the evils arising therefrom thoroughly explained to them. REGISTRATION.—The usual enquiries were made in each village, and the information obtained tested at the thannahs. The results have not been reported.

Behar Circle.—Assistant Surgeon Mothura Nath Sen, Deputy Sanitary Commissioner. The observations of this officer relate to the Patna, Shahabad and Chumparun districts. VILLAGES.—The villages are situated mostly on raised

ground, surrounded by low, closely-cultivated paddy-fields. The habits of the people are active, but they are intemperate to the extreme, the Brahmins and Rajpoots excepted. DWELLING HOUSES.—The houses are generally mud-walled. This necessitates the digging of deep pits in which every sort of household refuse is thrown, and these pits contain, nearly all the year round, water of the foulest description. The houses and the cattle-sheds are kept clean; the former are very much crowded; the ventilation is very defective; and overcrowding within the houses at night is general. Their floors are damp in the Chumparun district, but in Patna and Shahabad they are not so, except during the rainy season. ROADS.—There are no roads in any village; but there are foot-paths between the houses, and as they are often below the level of the foundations of the houses, they serve the purposes of drains. WATER-SUPPLY.—Well water is used everywhere, tanks being rare. In Chumparun the wells are comparatively shallow, whilst in Patna and Shahabad they are about 22 or 23 feet deep. They have been generally dug in well-raised ground, and most of them are protected by raised masonary rims against the re-entry of spill water into them; but their sourroundings are very filthy, as bathing, washing of cooking utensils, &c., are carried on near them. CONSERVANCY ARRANGEMENTS.—Conservancy arrangements do not exist anywhere. There are no public latrines, so the people defœcate everywhere and anywhere. There are heaps of refuse matter in front of almost every house. The private privies of the better classes consist of well-privies or sundasses. Cattle-dung is extensively accumulated for use as fuel. DISPOSAL OF THE DEAD.—There are no burning ghâts. The dead are removed to the nearest river bank for cremation. The corpses are partially cremated and thrown into the river, in some cases after only disfiguring the face. The burial-grounds are outside the villages, close to them but not near tanks or wells. CLOTHING.—The people are very scantily clothed, and during the cold-weather the lower classes, as a rule, sleep on straw, and many of them for want of other covering, cover their body with the same material. Personal cleanliness is neglected everywhere. FOOD-SUPPLY.—The people live to a great extent on makai. The poorer classes subsist on one meal at night, consisting of rice, dâl and vegetables, taking during the day only a handful of *chattoo* or *chabuni*. ADVICE TO THE PEOPLE.—The following were offerred:—(1) Not to defœcate anywhere within the village, but to resort to the fields outside, at a distance of about 100 yards from dwelling-houses; (2) to utilize the refuse matters as manure and the sweepings for filling up holes and pits; (3) to set apart one or two wells solely for drinking-water; (4) to set apart a plot of land all round the village solely for the cultivation of the rubbi crop; (5) to plant trees. REGISTRATION.—The prescribed procedure on this subject was observed, and discrepancies were detected in 30 villages. The Superintendent found some difficulty in verifying the registration owing to the villagers being very illiterate, and to the chowkidars partly entering the events in their books and partly reporting them orally at the thannahs. Some of the chowkidars were, moreover, not supplied with books. Nevertheless, he is of opinion that the registration of deaths is approximately correct. GENERAL HEALTH.—The general health of the circle was found to be good everywhere. In the Motihari and Dhaka thannahs in Chumparun, a few cases of chronic *fever* were noticed here and there. *Small-pox* broke out during the latter months of the year in the Patna Municipality and in some isolated villages in thannahs Dinapore, Maner, Bikram, Massaudi and Silao in Patna, the Patna town suffering most.

CONCLUSION.

Inspection by Sanitary Commissioner of the work of the Deputy Sanitary Commissioners.

229. I regret that the orders of the Government of India, conveyed in paragraph 5 of Bengal Government letter No. 324 of the 31st January 1884, did not reach me in time to be acted on during the past vaccinating season, but they will have my attention during future seasons. I may say, however, that I have in previous years held as much personal communication with Superintendents during my tours as my inspections in Municipalities would permit me to afford.

Impracticability of submitting the Report on 1st May—later date should be fixed.

230. I also regret the delay in the submission of this Report, but the time allowed for the collection and analysis of the vaccination statistics of this great Province is quite insufficient. The season ends with the 31st March,

so that individual vaccinators cannot close their returns before the 6th April. Between this date and the 1st May the returns have to pass from the hands of the vaccinators into those of the Inspectors to be checked by them and by the Deputy Superintendents, and then to be forwarded to the head-quarters of each circle, where they are compiled in the Superintendents' offices, who are also required to prepare exhaustive reports. These reports are then sent to the Sanitary Commissioner's office, where the whole statistics of the Province are compiled and reported on, and then printed for submission to Government by 1st May. In this period of 25 days three transmissions by post occur, the first from many of the most remote and inaccessible corners of districts, where communication is slow, the letters being carried by dâk runners. Given every vaccinator at his post on the 6th April and in good health, every Inspector in a particular appointed spot on a certain day to receive returns—none of which require to be returned for correction—no mistakes or delays in the post office, no outbreaks of small-pox requiring urgent attention on the part of any subordinate or superior officer, there would then be almost an impossibility in meeting the requirements of the Government of India with regard to the submission of this section of the Report, even if the conditions above sketched were ever likely to be fulfilled. The returns are now received monthly to facilitate matters as much as possible, but sufficient time should be given to deal carefully with such a mass of important statistics which in time would become a valuable scientific record. I am unwilling to bring much more pressure on the vaccination establishment, as I find evils arising thereby. To meet the requirement of early submission of the Report, the vaccinating season is being curtailed, so that compilation of returns may begin quite a week or so earlier than the 31st March, and even then are closed without proper inspection of results; and if received imperfect, would hardly be returned for correction by Inspectors, thus destroying their value. There is therefore established a tendency to submit incorrect or falsified returns. There is another evil arising from this insistence on early submission of returns, and this is, that during the period employed in their compilation all other duties are neglected. To avoid delay in their submission this season, I found that the Deputy Superintendent, Sonthal Pergunnah Circle, employed the first fifteen days of April 1884 entirely in attention to this duty, at a time when small-pox was prevalent in his circle and requiring his constant attention and supervision. I beg the Government will urge upon the Government of India the necessity of granting longer time, and fixing a later date for the submission of my Report. It is necessary both in the interests of public health and of correct and truthful statistics.

The last returns and reports of the season under review were not received in my office from the Eastern Bengal Circle till the 17th May.

R. LIDDERDALE, M.D.,

Deputy Surgeon-General,

Sanitary Commissioner for Bengal.

The 23*rd June* 1884.

APPENDIX No. I.

VITAL STATISTICS OF THE DISTRICTS IN BENGAL

FOR THE YEAR 1883.

ANNUAL FORM NO. I.—BIRTHS *registered in the principal Municipalities and Towns in the Districts of the Bengal Province during the year* 1883.

	TOTAL FOR THE PROVINCE	84,059	69,276	84,372	77,019	50,090	45,377	37,958	25,[illegible]80	34,800	32,278	78,911	71,925	81,687	61,797	73,903	52,146	60,159	51,154	90,477	82,349
	*RATIO PER 1,000 LIVING	110·26	88·37	21·37	18·38	11·[illegible]	9·15	10·11	8·60	14·01	12·68	15·18	12·17	16·79	13·17	22·89	16·44	31·95	25·21	50·67	38·48

* These ratios have been calculated on the total population of the Province less 36,434. This is owing to the facts, first, that the ages of 35,408 persons are not specified in the Census tables of 1881, and, secondly, that at a census of the European population taken in 1884, owing to the then existing population having been under-estimated at the previous enumeration, their ages were not recorded in conformity with the 10 groups adopted in the Census tables of 1881, but in two groups of "not exceeding 12 years" and "12 years and upwards."

OFFICE OF THE SANY. COMMR. FOR BENGAL,
The 18th April 1884.

R. LIDDERDALE, M.D.,
Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

OFFICE OF THE SANY. COMMR. FOR BENGAL,
The 15*th April* 1884.

R. LIDDERDALE, M.D.,
Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

APPENDIX No. III.

SUMMARY OF SANITARY WORKS, IMPROVEMENTS, &c., CARRIED OUT IN TOWNS AND DISTRICTS

DURING THE YEAR 1883.

Summary of Sanitary Works, Improvements, &c., which were carried out in Towns and Districts during the year 1883.

CONSERVANCY.

In Towns.

Latrines and Urinals.

Public latrines and urinals were constructed in the following Municipalities:—

Towns.		Districts.		Number, with Remarks.
Bankura	...	Bankura	...	2.
Midnapore	...	Midnapore	...	1.
Tumlook	...	Ditto	...	1.
Ghatal	...	Ditto	...	5. Two of these are in progress.
Bhudosher	...	Hughli	...	Number not mentioned.
Bydobatti	...	Ditto	...	Latrines and urinals, number not mentioned.
Utterpara	...	Ditto	...	Number not mentioned.
Serampore	...	Ditto	...	Latrines and urinals, number not mentioned.
Bansbaria	...	Ditto	...	Number not mentioned.
Hughli	...	Ditto	..	3.
Howrah	...	Howrah	...	Latrines and urinals, number not mentioned.
Krishnaghur	...	Nuddea	...	In progress, number not stated.
City Murshidabad		Murshidabad	...	1 for males and females.
Kandi	...	Ditto	...	4.
Dinagepore	...	Dinagepore	...	4. Two of these are in progress.
Nattore	...	Rajshahye	...	2 with sheds for mehters and ponies.
Bogra	...	Bogra	...	1.
Sherpur	...	Ditto	...	4. Two of these are urinals.
Darjiling	...	Darjiling	...	7.
Kurseong	...	Ditto	...	2.
Julpaiguri	...	Julpaiguri	...	5.
Barisal	...	Backergunge	...	1.
Sherpore	..	Mymensing	...	3.
Jamalpore	...	Ditto	...	10.
Nasirabad	...	Ditto	...	2
Brahmanberia	...	Tipperah	...	Some in progress, number not stated.
Sudharam	...	Ditto	..	4 urinals.
Barrh	...	Patna	...	Number not mentioned.
Futuha	...	Ditto	...	Ditto.
Jehanabad	...	Gya	...	Ditto.
Gya	...	Do.	...	2. One temporary and one in progress, including buckets, pans, baskets, &c.
Buxar	...	Shahabad	...	1.
Arrah	...	Ditto	...	7 urinals, in progress.
Durbhanga	...	Durbhanga	...	8. Three of these are in progress.
Mudhubani	...	Ditto	...	1 in progress.
Sewan	...	Sarun	...	1.
Chapra	...	Ditto	...	7. One includes cost of land: the other six are DeAbrue's moveable latrines.
Ditto	...	Ditto	...	1. One urinal.
Monghyr	...	Monghyr	...	1.
Bhagulpore	...	Bhagulpore	...	3. Two of these have galvanized iron roofs—1 is in progress. Also some mat latrines, number not stated.
Purneah	...	Purneah	...	1.
Sahebgunge	...	Sonthal Pergunnahs	...	8 corrugated iron urinals.
Cuttack	...	Cuttack	...	2. One latrine and 1 urinal.
Puri	...	Puri ...	...	1.
Balasore	...	Balasore	...	11. Eight of these are urinals.
Daltongunge	...	Lohardugga	...	Number not mentioned.
Ranchi	...	Ditto	...	Ditto.
Gharwa	..	Ditto	...	Ditto.
Purulia	...	Manbhum	...	2.

Carts, bullocks, &c.

Conservancy and night-soil carts, with bullocks, &c., for the more efficient carrying out of conservancy arrangements, were provided in the under-mentioned Municipalities:—

Towns.		Districts.		Nature of work.
Bansbaria	...	Hughli	...	Conservancy carts, number not mentioned.
Santipur	...	Nuddea	...	5 Ditto, with 2 bullocks.
Darjiling	...	Darjiling	...	6 Hand-carts for conveying cook-room washings.
Jalpaiguri	...	Jalpaiguri	...	2 Conservancy carts.
Nasirabad	...	Mymensing	...	4 Two Conservancy and 2 Watering carts.
Brahmanberia	...	Tipperah	...	1 Conservancy cart.
Patna	...	Patna	...	8 Ditto.
Obra	...	Gya	...	Conservancy carts, number not mentioned.
Nobinnagar	...	Do.	...	Ditto.
Daudnagar	...	Do.	...	Ditto.
Aurangabad	...	Do.	...	Ditto.
Sherghatti	...	Do.	...	2 Conservancy carts.
Jehanabad	...	Do.	...	2 Wheel barrows.
Durbhanga	...	Durbhanga	...	4 One Watering (in progress) and 3 Night-soil carts.
Madhubuni	...	Ditto	...	Conservancy carts, number not stated.
Puri	...	Puri	...	30 Night soil-carts.

Establishment.

The conservancy establishment was strengthened in the Bettiah and Behar Municipalities.

Buildings constructed for Conservancy purposes.

Under this head may be enumerated 13 latrine sheds in *City Murshidabad*; a small shed and barracks for domes (in progress) in the *Patna* Municipality; barracks for mehters (1 roofed with iron) and a new pound-house in *Darjiling*; a stable for conservancy cattle in *Pubna*; mehters' huts in *Muktagachi* in Mymensing; a cart-shed, a bullock-shed, and a shed for dry earth, including cost of land in *Chupra*; a cart-shed in *Monghyr*; 1 bullock-shed in *Bhagulpore*; 3 houses for mehters and 1 godown for carts and bullocks in *Kissengunge* in Purneah; 2 conservancy depôts in *Cuttack*; and a pound-house, including gravelling of compound thereof, in *Purulia* in Manbhum.

Trenching Night-soil.

The system of burying night-soil in trenches was extended to the three remaining wards in the *Puri* town; and land was taken up or acquired for trenching night-soil in *Motihari* in Chumparun, in *Jamalpore* in Monghyr, in *Chupra*, and in *Durbhanga*.

General Conservancy Improvements.

Not the least important of the sanitary measures carried out during the year were the following:—Some bustees in the *Suburbs of Calcutta*, (at a cost of Rs. 1,110), in *Howrah* (at a cost of Rs. 1,130), and in *Serampore* were reclaimed and improved with regard to roads, drainage, water-supply, houses, &c. A number of thatched and unsightly native houses were demolished in the *Darjiling* Municipality. Three swamps and a foul tank were filled up in *Sudharam* in Tipperah. Arrangements have been made for a wire tramway for the removal of sweepings and rubbish to a remote spot, ten dust-bins were put up at various points, and stone-ware pipes were laid for cook-room washings in certain localities in *Darjiling*. The Latrine Act was introduced into the *Patna* Municipality, and domes were imported from Behar for carrying out its details. Jungle was reclaimed in *Manikgunge* in Dacca at a cost of Rs. 1,280. Trees were planted on the road-sides in *Tangail* in Mymensing, on five roads in the Backergunge district at a cost of Rs. 899, and in the Gya district, (6,118, at a cost of Rs. 6,845).

DRAINAGE.

In Towns.

General Drainage Schemes carried out or in hand.

In the *Serampur* Municipality a drainage scheme has been devised at an estimated cost of Rs. 30,091. Large open drains were constructed in connection with the pits and excavations in the *English Bazar* Municipality for carrying off surface impurities and keeping the inhabited parts of the town and villages dry and well drained. At *Ghattal* in Midnapore a scheme is on foot for opening up a sluiced khal for its thorough drainage. A survey has been made of the *Berhampore* town in Murshidabad, and levels taken for improving its defective drainage. Further improvements to the drainage scheme in *Lalbagh*, in the same district, by a system of subsidiary drains are to be effected, and a beginning was made by constructing a surface drain in ward Shahanuggur. The drainage works in *Azimgunge*, also in the same district, were commenced. A scheme is on foot in the *Dinagepore* Municipality, in extension of the present one—and will shortly be accomplished—for the drainage of its western part by means of a canal with a sluice gate opening into the Purnabhaba river, six miles south. Much is being done for the improvement of the badly sanitated and straggling town of *Chittagong*. Government has granted Rs. 10,000 for its sanitation, and a survey is being made, having for its object the provision of pucca drains and a bridge, the improve- of an important drain running through the bazar, and the re-digging of the Chaktai khal, with the view of improving the drainage of a large section of the town. In the *Cuttack* town the drainage scheme was further improved by the construction of a branch drain from Gooptipool, by which surface water will be carried off from the central part of the town; by building some bridges over the drains; and by lining the latter with stone to prevent percolation of their contents into the sub-soil.

Other Drainage Measures.

In the undermentioned Municipalities new drains, with the necessary culverts, pipes, bridges, &c., were constructed; or alterations, &c., of existing drains calculated to improve drainage, such as providing culverts, pipes, sluices, protecting walls, &c., re-excavating, rectifying levels, removing of obstructions, carrying out extensions, &c., were effected:—

In Districts.

Drainage Works carried out in Districts.

The Surpai khal in the *Midnapore* district was drained at a cost of Rs. 58,000. A bridge was constructed over the Ari khal on the Mugra Mahomed road in *Hughli* at a cost of Rs. 3,495. In the 24-*Pergunnahs* district, a khal along the Diamond Harbour road from Saracole to Sorisa was improved, and the Dhapa ditch was excavated and provided with a foot-path and five culverts. The cost of these works amounted to Rs. 16,434. The drainage of the fever-stricken district of *Nuddea* was considerably improved in the manner described in section IX of the Report, at a cost of over Rs. 20,000. In the *Murshidabad* district the two main cuts—the northern and the southern—about 8½ miles in length, which drain the *Berhampore* town and the low levels and bheels between the town and Gobra nulla, and the Farashdanga cut which, drains the Kaliganj bheel, which receives the drainage of the villages on both sides of it, were cleared and deepened. New drains were provided and the roads raised to remove obstructions to drainage in the *Dinagepore* district. In the *Purneah* district three bridges were constructed at a cost of Rs. 14,518. A survey of the great swamp south of Rajmehal in the *Sonthal Pergunnahs* was undertaken with a view to improve its drainage.

ROADS.

In Towns.

New Roads.

New roads with the necessary appliances for securing drainage, waterway, &c., were constructed, or were in progress of construction, and existing roads were extended or widened in the undermentioned Towns:—

Beauleah	Rajshahye.	Ranchi	Lohardugga.

In Districts.

In the undermentioned places important roads, whereby the sanitary condition of the villages through which they were laid was greatly improved, were constructed. They were in all cases provided with the necessary culverts, pipes, bridges, &c., for securing adequate waterway.

Districts.	Number.	Probable Cost.
		Rs.
Burdwan	Not stated	55,531
Bankura	20	Not stated.
Hughli	Not stated	23,128
Khulna	Ditto	3,121
Dinagepore	2	Not stated.
Pubna	Not stated	Ditto.
Noakhalli	2	Ditto.
Patna	3	Ditto.
Monghyr	14	1,165
Purneah	7	4,247

By Private Individuals.

Moharaj Luckessur Singh, Bahadoor, provided a road in the Sudder sub-division of Monghyr at a cost of Rs. 400, and three kutcha roads were constructed by private individuals in the Sudder sub-division of Howrah at a cost of Rs. 871-8.

WATER-SUPPLY.

In Towns.

Water-supply Schemes undertaken.

In the *Burdwan* Municipality the water-works scheme was further progressed with (*vide* section IX of the Report) at a total expenditure of Rs. 1,10,519. The water-supply scheme in the *Darjiling* Municipality was extended and supplemented in the manner described in section IX of the Report, at a cost of Rs. 8,057. This scheme was also extended to the *Kurseong* town at a cost of Rs. 2,466. In the *Berhampore* town in Murshidabad a channel with sluice was constructed through Gora Bazar for the purpose of flushing several tanks and shallow basins with water from the Bhagiruthi river, and thus securing fresh water for the inhabitants. In the *Nattore* town in Rajshahye river water was introduced into the municipal tank and the outer moats, by deepening and widening the mouth of the Narud, and a channel was excavated to expel the foul water of the town. In the *Dacca* town the defects of the water-works were rectified (*vide* section IX of the Report). The project for the supply of filtered water to the town of *Bhagulpore*, referred to in the Report for 1882, was submitted to Government for approval at the close of the year under review. The water-supply of the *English Bazar* town was greatly improved by re-digging and cleaning eight large tanks in parts of the town away from the river, and by providing four of them with masonry ghâts.

Tanks provided in special localities.

New tanks were excavated, and the existing ones either re-excavated, cleaned or improved, and the foul and stagnant ones filled up in the following Municipalities:—

Towns.	Districts.	Number.	Remarks.
Ranigunge	Burdwan	1	for hospital newly excavated.
Soori	Birbhum	1	re-excavated.
Tumlook	Midnapore	1	ditto.
Utterpara	Hughli	1	newly excavated.
Howrah	Howrah	1	newly excavated. Some private tanks also were fenced.
Barripore	24-Pergunnahs	1	newly excavated.
Suburbs of Calcutta	24-Pergunnahs	1	ditto.
Mohespur	Jessore	1	re-excavated.
City Murshidabad	Murshidabad	2	one filled up and 1 newly excavated.
Dinagepore	Dinagepore	1	cleaned and set apart.
Pubna	Pubna	1	newly excavated.
Madaripore	Faridpore	1	ditto.
Perozepore	Backergunge	1	ditto.
Brahmanberia	Tipperah	1	ditto.
Monghyr	Monghyr	1	ditto.
Ranchi	Lohardugga	2	one deepened and one newly excavated (in progress.)

Wells provided in special localities.

New wells were sunk, or the existing ones improved generally, &c., in the following Towns:—

Towns.	Districts.	Number.	Remarks.
Ranigunge ...	Burdwan	1	Cover for mouth provided.
Bankura ...	Bankura	1	Platform provided.
Kissengunge ...	Nuddea	Not stated	Sunk.
City Murshidabad	Murshidabad	1	Do.
Kandi ...	Ditto	3	Do.
Sherpur ...	Bogra	8	Do.
Bogra ...	Bogra	8	One masonry and six kutcha wells sunk, and one cistern provided.
Serajgunge ...	Pubna	1	Sunk.
Jugdispur ...	Shahabad	1	Do.
Chupra ...	Sarun	1	Do.
Monghyr ...	Monghyr	1	Do.
Jamalpur ...	Ditto	1	Do.
Madhepura ...	Bhagalpore	6	Do.
Ranigunge ...	Purneah	2	Do.
Sahebgunge ...	Sonthal Pergunnahs ...	Not stated	Including platforms around them.
Cuttack ...	Cuttack	2	Sunk.
Daltongunge ...	Lohardugga	...	Chains and buckets for wells provided.

In Districts.

Water was brought down through the Kana Nuddi from the Damuda to the Saraswati river in the *Hughli* district, by which process a succession of filthy and stagnant pools was converted into a flowing stream, conferring great benefit to the densely populated villages on the banks of the Kana Nuddi. Some reservoirs for the storage of water were constructed in different parts of the *Sonthal Pergunnahs* district. The reports, moreover, show that tanks and wells were constructed in the following districts. Those provided by private individuals are distinguished from the others.

Districts.	Localities.	Number of Tanks or Wells.	Cost.	Names of the Private Individuals at whose cost they were constructed.
			Rs.	
Burdwan	In different places	Tanks and wells, number not stated.	Not stated	By private individuals, names not furnished.
Hughli	Belkuli in Singur thanah	1 tank	1,023	....
	Ditto ditto ...	1 do. re-dug	700	Ditto ditto ditto.
	Serampore sub-division	4 tanks excavated ...	917	Lokenath Dass, Luckhinarain Nundy, Kirtibash Kodaley, and Gyaram Sircar, one each.
	Satgong in Hughli thanah ...	1 tank ditto ...	1,100	Nittya Nundo Dass.
Murshidabad ...	Ward Cossimbazar in Berhampore town.	1 do. ditto ...	Not stated	Moharanee Shurnomoyee Dassia, commenced in 1882, completed this year.
	In different places	Some tanks excavated, number not stated.	Ditto	Some zemindars and others, names not furnished.
Rajshahye ...	Ditto	Several ditto ditto ...	Ditto	Private individuals, names not furnished.
Pubna	Jamutor in Shazadpore Station ...	1 tank excavated ...	800	Denobundho Bahaduri, zemindar.
	Tarash	1 ditto ...	700	Shiraj Fakir.
	Nokarshan in Ranigunge station	1 ditto ...	1,150	Tarini Sircar.
Faridpore ...	Not stated	5 tanks excavated ...	1,163	....
	In different places	9 ditto ...	5,650	Parus Nath Ghose, Kali Kumar Sircar, Guru Churn Rudra, Prahlad Tanti, Baul Chandra Bhunaik, Khankar Murundai, Rajkumar Sircar, Bhagiruth Barui and Krishna Churn Jogi, one each.
Backergunge ...	In some villages	Some excavated, number not stated.	Not stated	By rich men, names not furnished.
Mymonsing ...	In Halwa Hati in Jamalpore sub-division.	1 tank excavated ...	1,100	Balya Chundra Shaha.
Monghyr	Monlanagore in Sudder sub-division.	1 ditto ...	4,000	Sha Alamand.
	Bhowanipur in Sudder sub-division.	1 ditto ...	1,000	Behari Kurmi.
	Sudder sub-division	1 ditto ...	500	Mohunt Sawah Ram.
Bhagulpore ...	Ditto ditto	15 wells sunk ...	Not stated	....
Maldah	Old Muldah town	1 tank improved ..	1,100	Tulshi Ram Shah.
Sonthal Pergunnahs	Mohigunge, sub-division Jamtarah.	1 tank excavated ...	Not stated	Mr. Smith, Ballast Inspector.
Poori	Mouzah Shibchandrapur in Bhanpur.	1 ditto ...	500	....
	Mouzah Balchadrapur	1 ditto ...	300	. . . . . .
	Kachrakoili	1 ditto ...	500	Masmat Rabbi.
	Agarpara	1 ditto ...	165	Bangshi Patti.

DISPOSAL OF THE DEAD.

In Towns.

Burning-ghâts were provided in the *Barripore* and *Baranagore* towns in the 24-Pergunnahs: an incinerator for dead animals and slaughter-house offal was constructed in the *Darjiling* Municipality; land was purchased for burning and burying grounds in *Kandi* town in Murshidabad; a cart was provided for conveying corpses in *Meherpur* town in Nuddea; and enclosure walls to the burning-ghâts were constructed in the *Howrah* Municipality.

MARKETS AND SLAUGHTER-HOUSES.

In Towns.

Markets.

In the *Darjiling* town a meat shop was constructed in the Bhootea busti, and the meat market at the old slaughter-house was extended. A Municipal market was constructed in *Madhubuni* in Durbhanga, The Municipal market in *Monghyr* town was arched and walled. A butcher's shop was constructed in the *Hazaribagh* Municipality. In the *Purulia* town in Manbhum, a shed in the market, a butcher's shop also in the market, and a gola for storing rice were constructed.

Slaughter-houses.

In the *Darjiling* Municipality two slaughter-houses, one in the Bhootea busti and the other for sheep, were constructed. Two slaughter-houses with pits around them were constructed in the *Bhagulpur* town. Slaughter-houses were provided in *Arrah* in Shahabad, in *Hazaribagh*, and in *Purulia* in Manbhum.

PROTECTION TO TRAVELLERS.

In Towns.

A long range of rooms for travellers was provided in *Berhampore* town by Maharanee Shurnomoyee Dassia; a serai was built in the *Bettiah* town; and a pucca shelter-house for the Hindus was constructed in the *Cuttack* Municipality.

MEDICAL RELIEF.

In Towns.

A mortuary, or dead-house, was provided in the *Howrah* Municipality. The *Barripore* charitable dispensary was in course of construction. In *Darjiling* the Eden Sanitarium was opened for the reception of patients in April 1883, and the charitable and small-pox hospitals were roofed with corrugated iron. In the *Kurseong* town a temporary shed for small-pox patients was constructed, and a partition wall put up in the dispensary. In the *Madaripore* town in Faridpore a cholera-shed and a dispensary-shed were constructed. In *Purulia* in Manbhum a contagious disease hospital was built.

In Districts.

In *Monghyr* a dispensary was constructed in Jamui, and the dispensary at Jamalpore, the gift of Mr. Dear, referred to in the last year's Report, was completed and occupied this year. It cost Rs. 31,000. A hospital at Ulipore in Rungpore was provided by Maharanee Shurnomoyee Dassia.

OFFICE OF THE SANY. COMMR. FOR BENGAL,
The 28*th April* 1884.

R. LIDDERDALE, M.D.,
Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

APPENDIX No. IV.

ABSTRACTS OF INSPECTION REPORTS ON TOWNS VISITED IN 1883.

Abstracts of Inspection Reports on Towns visited in 1883.

Howrah.—*Inspected in January.*—On the whole this town is in a creditable condition, and there is ample evidence to indicate that its sanitary welfare engages the keen interest of the Commissioners, their chief attention being directed to the important matters of bustee improvement, water-supply, drainage, and conservancy, notably house scavenging from which source alone an income of Rs. 60,947 was derived in 1882.

Suggestions offered:—(1) To extend the house scavenging service, so that it may cover the whole town. (2) To provide a water-service for the municipal slaughter-house. (3) Till the scheme for supplying filtered water to the town is brought into operation, to keep strictly free from pollution the reserved tanks and the river, and to induce the people to keep their private wells and tanks, which are more or less filthy, in a wholesome condition. (4) To improve registration in the manner indicated, and to utilize fully the provisions of the Compulsory Registration Act.

Action taken on the suggestions.—It was reported that the question of providing a water-service for the slaughter-house would be taken into consideration when the budget estimates of the ensuing year were to be prepared.

Serampore.—*Inspected in February.*—Great and commendable attention is directed by the Commissioners to the sanitary condition of this Municipality, of which the many improvements which have been, or were about to be effected, bear convincing testimony.

The suggestions were:—(1) To fill up the unusually large number of filthy excavations in wards Serampore and Rishra. (2) To take into consideration the bringing into operation of sections 257 to 266 of the Municipal Act relating to building regulations. (3) To metal those roads which have not received this attention. (4) To provide more public latrines. (5) To extend the Latrine Act to the remainder of the Municipality where there are private privies in a very filthy and objectionable condition. (6) To improve the water-supply arrangements. (7) To suppress the practice of interments within the enclosures of houses. (8) To improve registration, and to fully utilize the provisions of the Compulsory Registration Act.

Action taken on the suggestions.—It was resolved to fill up the excavations and dirty coss-pools as far as practicable; to metal the kutcha roads as far as funds will allow; and to stop the practice of burying the dead within the enclosures of houses as far as possible. The Commissioners were of opinion that it would be a great hardship to the people if sections 257 to 266 of the Municipal Act were brought into operation; they were in communication with the Government about the arrangements for supplying filtered water to the town; and they considered that there was no necessity to introduce the Latrine Act to the Rishra ward, or to the Mohes ward pending the fulfilment of the promise made by the owner of the bustee in this ward to put up public latrines.

Buxar.—*Inspected in March.*—The condition of this town was anything but satisfactory, serious defects existing almost under every head of sanitation.

The recommendations were:—(1) To enforce with greater activity the sanitary clauses of the Municipal Act. (2) To remove the long chabootras, unnecessary steps and projecting buildings across the drains, and to prevent all such encroachments in future. (3) To provide a proper system of drainage. (4) To remedy the overcrowding of houses, which at present obtains, on the occasion of fires. (5) To strengthen the existing insufficient establishment. (6) To provide additional latrines, as the present number covers only half the town, necessitating the people to resort for defæcation anywhere and everywhere. (7) Prior to carrying out the suggestion 6, to give a trial to Major Ramsay's Patent Portable Latrine. (8) To provide the cutcherry and markets with latrines. (9) To suppress the many objectionable well-privies. (10) To place the private privies, which are in a filthy condition, under municipal supervision. (11) To prohibit the practice of the people keeping outside their houses large earthen pots containing washings and sweepings, which rot in the sun. (12) To prevent the accumulation of cattle and human ordure in Saniputty, which is said to be notoriously the most unhealthy quarter of the town. (13) To efficiently protect the drinking water-supply from the many pollutions to which it is subject. (14) To peremptorily stop the practice of throwing the pauper dead into the river, making provision for their interment or cremation. (15) To carry out the proposal to introduce the Compulsory Vaccination Act. (16) To improve registration, and to fully utilize the provisions of the Compulsory Registration Act.

Action taken on the suggestions.—The following is the substance of the reply furnished. The Municipal Commissioners were utilizing the amount hitherto paid for the Police in carrying out sanitary works. They had expended Rs. 526 in constructing a drain, and had budgetted Rs. 500 for sinking a well. Want of a preventive establishment precluded the full utilization of the sanitary clauses of the Municipal Act, but steps will be taken to enforce them. The kutcha drains in front of houses are being kept clean, pending their conversion into pucca ones, which is a question of funds. One cart has been added, but there are no funds for more. It is intended to provide latrines later on when savings become available. The accumulation of rotting washings, sweepings, and vegetable debris will be

prohibited. The conservancy staff is being gradually increased. It is under contemplation to adopt the Portable Latrine. The people prefer the river water, but it is proposed to thoroughly clean the public wells and to re-excavate the large tank at Saniputty.

Arrah.—*Inspected in April.*—There is evidence to indicate that the sanitary condition of this town is receiving attention. It appeared, on the whole, to be a well kept one, and its people to be healthy and well-to-do. Nevertheless, there were many defects, referable to conservancy and drainage arrangements, which still required rectification. Some portions of the town are confessedly unhealthy, their insalubrity depending upon some of the most rudimentary sanitary wants. The villages of Dharar, Aneath and Puckree, and mohullas Melki and Aboorpool are amongst the number, whose unhealthiness is ascribed to obstructed drainage, contamination of the water-supply, dampness of the soil, and to the houses being constructed on low and confined situations.

The suggestions were:—(1) To consider whether the present low rate of taxation is compatible with the proper execution of necessary sanitary works on which the welfare of the town depends. (2) To utilize the provisions of the Latrine Act, as the numerous well-privies in the town indicate the necessity of their suppression, which cannot be effectually enforced without legal interference. (3) To give early effect to the proposal to substitute pucca drains for the existing kutcha ones. (4) To give effect to the proposition of providing more public latrines, as the present number meets the requirements of only half the town, the consequence being that the fields, ditches and vacant plots of ground are resorted to for defæcation by the poor. (5) Before carrying out suggestion 4, to consider the advisability of adopting Major Ramsay's Portable Privy. (6) To tar the drains of the public latrines. (7) To remove sweepings, refuse, solid and fluid, and the middens from the lanes and outlying portions of the Municipality. (8) To prevent the throwing of night-soil into convenient ditches and nullahs. (9) To provide additional carts for this purpose, as the present 10 carts are manifestly insufficient to remove the deposits of over 43,000 people. (10) To suppress the well-privies, which still exist to a large extent. (11) To see that those well-privies which are said to have been demolished, are properly filled up with earth and permanently closed, as some of them were ascertained by the Civil Surgeon to have been merely covered over with planks, and afterwards opened, from time to time, for the reception of night-soil and sweepings. (12) To induce the owners of the private markets to keep them in a clean condition, to have their floors paved, and to provide them with drains and latrines. (13) To remove the brick and lime kilns beyond municipal limits. (14) To prevent the re-entry of foul water into some of the public wells, and to protect the drinking water tanks from pollution. (15) To reserve some wells for drinking purposes, their conservancy being carefully attended to. (16) To undertake the disposal of the contagious disease dead. (17) To introduce the Compulsory Vaccination Act. (18) To improve registration, and to utilize fully the provisions of the Compulsory Registration Act.

Patna.—*Inspected in April.*—The condition of this town, although not quite satisfactory, is in several respects superior to that of most large towns in Bengal Defects exist particularly under the heads of conservancy, drainage and water-supply. For the first of these much has been done, and it will be further considerably improved, now that the Commissioners have, after prolonged deliberation and much conflict of opinion, again brought into operation the Latrine Act. At least two great evils will, it is hoped, vanish under this measure, viz., the many extremely filthy, pestiferous private privies, and the abominable sundasses or well-privies. The water in the wells, which are in very many cases situated in close proximity to these sundasses, will also no doubt benefit by their suppression; but the sub-soil of Patna must have become so saturated with polluting matters from the insanitary practices of generations, that it is very doubtful whether any single well now existing, or hereafter to be sunk within the limits of the town, could be depended upon for even a moderately pure drinking supply.

The suggestions were:—(1) To persevere in and bring to completion the work (in hand) of converting the kutcha, improperly levelled, and filthy drains into pucca saucer-shaped ones, and to give early effect to the proposed general drainage scheme, particularly as now the Municipality is effecting a saving of over Rs. 25,000 per annum, by having been relieved of the cost of Police establishment. (2) To carry out the proposition to provide additional public latrines and trenching grounds, and to supply wheel-barrows for the conservancy of the bye-lanes. (3) To bury the night-soil in shallow instead of deep trenches, and to cultivate the trenching grounds. (4) To give early attention to the contemplated provision of additional market sheds, as the existing one is insufficient for the requirements of the people, owing to the unusual length of the town not admitting of one market being generally resorted to. (5) To provide one or more slaughter-houses, and to levy a fee on each head of cattle slaughtered therein, in order to do away with the private slaughtering places, which are in a filthy condition with the offal, &c., buried or hidden in holes in their proximity. (6) To adopt stringent measures for the protection of the river, which is the chief source of the drinking supply, from pollution, by the entry of fluid refuse from the houses and workshops situated on and close to its banks, particularly as the wells are, as before stated, highly contaminated with polluting matters, and as amongst thickly populated communities, like those in Patna, it is almost impossible to maintain tanks (which are to some extent used here) within such a degree of purity as shall render them fit for drinking purposes. (7) To use every endeavour to close gradually the Mahomedan burying places called

mugberahs, which amount here to 523, most of which are situated within the enclosures of private houses. (8) To provide, as a first step towards this end, general burial-grounds in appropriate localities, the Mahomedan community, who number strongly in this city, being asked to meet a portion of the cost. (9) To improve registration, and to utilize fully the provisions of the Compulsory Registration Act.

Action taken on the suggestions.—It was reported that most of the suggestions have been attended to, and that the rest will receive attention as funds and circumstances will permit.

Darjiling.—*Inspected in November.*—The sanitation of this town receives a fair share of the attention of the Commissioners, who have rectified several of the insanitary conditions met with at the inspection in October 1882. But much more might be done for the improvement of this sanitarium. There ought to be no difficulty in doing this, as the income accruing to the Municipality is a large one, and as the major portion of the large amount hitherto paid for Police establishment, of which the Municipality has been relieved, is now available for sanitary purposes.

The suggestions were :—(1) To consider the advisability of providing a general drainage scheme, as stone drains, however admirably they answer the purpose where only rainfall has to be carried off, become more or less offensive in dry weather, when house drainage, however apparently inocuous, finds its way into them, as is the case in the bazars; and as it is feared that the earth under them becomes in course of time saturated with matter inimical to health. (2) To prohibit the employment of the municipal mehters on private work, and to consider the necessity of increasing the conservancy establishment, which is found to be too weak for the work of the station. (3) To undertake the cleansing of the private latrines under the Latrine Act, as great difficulty is at present experienced in obtaining access to them, and they are in a most unsatisfactory condition, particularly in the Darjiling bazar. (4) To improve the sanitary condition of the Bhootea bustee, Tumsang, Jore bungalow, Gumpahar and Singmari, which are considered the most unhealthy localities, owing, among other reasons, to the dirty habits of the people, who defœcate everywhere, and will not use public latrines. (5) To give effect to the proposal to introduce the Compulsory Vaccination Act. (6) To improve registration, and to utilize fully the provisions of the Compulsory Registration Act.

Julpaiguri.—*Inspected in December by Dr. Wood, Deputy Sanitary Commissioner, Darjiling Circle.*—The sanitary defects in this town are of a grave character, and the great drawback to rectifying them is want of funds, the income being small. It is hoped, however, that now that it has been relieved of Police charges, a portion of this saving will be employed in this direction. The most prominent defects are bad and obstructed drainage, unsatisfactory conservancy, and bad water-supply.

The recommendations were :—(1) To correct the defects in the metalling of some of the roads. (2) To remove or thin the bamboo clumps, uproot the jungle, and lop off the overhanging branches of trees which surround the union, particularly about Nyabusti and Telipara, which, with crowded houses, give these villages the reputation of being most unhealthy. (3) To remove existing encroachments over the drains, and to prohibit future encroachments. (4) When funds are available, to provide a system of pucca drains. (5) To dispose of the street sweepings and rubbish completely and properly. (6) To provide more public latrines, particularly one near the dâk bungalow and one near the jail. (7) To keep the public latrines in a scrupulously clean and wholesome condition. (8) As funds are not at present available to carry out the two immediately foregoing suggestions, to mark out certain plots of waste land beyond union limits for the people to resort to for defœcation, and to appoint a sweeper or two to cut trenches and cover in the night-soil. (9) To tar the floors and drains of the latrines, as well as the receptacles for night-soil. (10) To use dry earth in all the latrines. (11) To prohibit the union mehters to perform private work. (12) To pay better and more complete attention to the private latrines. (13) To bury the night-soil in a more systematic manner, and to provide additional conveniently situated ground for trenching night-soil. (14) To increase the strength of the establishment and the number of the carts, so that the conservancy and latrine arrangements may be more efficiently attended to. (15) To suppress the well-privies, inducing the owners to provide in their place properly constructed surface privies. (16) To cause the owner of the Din Bazar market to keep it in good order and improve it. (17) To protect the river Kurla, which forms the chief source of water-supply for the natives, from the many pollutions to which it is subject. (18) To adopt steps for the introduction of the Compulsory Vaccination Act. (19) To improve registration, and to utilize fully the provisions of the Compulsory Registration Act.

Action taken on the suggestions.—The report received shows, (1) that the thinning of bamboos lopping trees and uprooting jungle cannot be undertaken, as by this procedure private property would be interfered with, and there is no law authorizing such interference, and that, moreover, the people object to the measure, particularly with regard to bamboos, which is valuable property; (2) that the drainage defects will be attended to when funds become available; (3) that the drawbacks to improving the conservancy are want of legal authority to enforce orders (the sanitary clauses of the Municipal Act not being in force, as this town is a union), and the apathy of the lower classes with regard to sanitary matters; (4) that an attempt to induce the people to resort to public latrines on the payment of one anna a head, or to have private privies of their own, was met by the submission of a petition, numerously signed, to the Commissioner, stating that a latrine tax was being imposed upon

them, and that they preferred the fields to public latrines, and that when they found that it was optional with them to use public latrines or not, they almost all forsook the latter for the former; (5) that better success attended this effort among the respectable classes, as 140 of their privies were placed under union supervision; (6) that a latrine would soon be constructed for the dâk bungalow; (7) that the water of the Kurla river is not drank, and that its banks are cleaner than they used to be; and (8) that it is difficult to improve registration under the present organization, as any pressure on the chowkidars would result in fictitious returns.

Sherpur.—*Inspected in December by Dr. Wood, Deputy Sanitary Commissioner, Darjiling Circle.*—The condition of this town is very unsatisfactory, grave defects, calling for urgent reform, existing under every head of sanitation. Most of the houses wear a tumble down appearance, and there are upstanding ruins to be met with in many gardens. Tigers infest the southern portion of the town, which appears, in fact, to be in a state of decay.

The recommendations were:—(1) To devote a larger share of the income than at present to sanitation, and to utilize for the same purpose the amount hitherto expended for Police establishment of which the town has been relieved. (2) To administer the sanitary clauses of the Municipal Act with activity and closeness, to frame and introduce a Code of bye-laws under this Act, and to bring into operation certain omitted sections of the same Act bearing on sanitary matters. (3) To metal the roads, as none of them have been so treated. (4) To fill up the large and deep excavations about the town. (5) To widen the roads, all of which, excepting the main one, are narrow, by taking advantage of fires. (6) To cause the people to keep their compounds in a clean condition and to uproot the jungle. (7) To devise and bring into effect a proper system of drainage, and, in the meanwhile, to keep in proper working order the existing drains, which are mere unlevelled kutcha channels, some too deep, others too shallow, and all more or less obstructed with filth, sweepings, decaying vegetation, &c., and encroached upon by projections, &c. (8) To utilize the street sweepings in filling up excavations instead of heaping them up with the view of eventually burning them. (9) To demolish the four existing latrines, which are faulty in construction and useless in other ways. (10) To employ Major Ramsay's Portable Land Manuring Privies, or, if the introduction of these is found impracticable, to provide properly constructed privies, the conservancy of which it will not be difficult to attend to, and to increase the number of these conveniences, as the existing number affects less than half the town, and necessitates most of the people to defœcate anywhere and everywhere. (11) To tar periodically the floors, and walls up to three feet high, of the latrines as well as the fœcal gumlows. (12) To use dry earth in the latrines. (13) To cause the mehters to clean the latrines twice a day, instead of once as at present. (14) To do away with the urinals which are simply nuisances. (15) To suppress the abominable sundasses or well-privies, and to induce the owners to supply in their place properly constructed and well conserved surface privies. (16) To have the private privies cleaned by municipal mehters under municipal supervision. (17) To adopt the Monghyr plan of trenching night-soil, providing sufficient ground for the purpose. (18) To do away with the middens. (19) To cause the owners of the two market places to provide them with latrines. (20) To remove, beyond municipal limits, the lime kilns and the tanneries. (21) To select tanks in different parts of the town, clean them out, reserve them exclusively for drinking purposes, and effectually protect them from pollution of every kind. (22) To repair the public wells, providing them with drainage channels for leading the spill water to the nearest drain. (23) To establish ghâts for takiñg drinking water from, and for bathing and washing, apart from one another. (24) To protect the river from being polluted by sewage from the drains, by being resorted to for defœcation, &c. (25) To provide a burial-ground for the Mahomedans, and prohibit them from burying their dead near their houses. (26) To see that graves are dug seven feet deep and not four and a half feet, as the Mahomedan system of roofing the vault, in which the body is buried, needs this depth. (27) To cause the pauper contagious disease and lunatic dead to be cremated instead of being thrown into the river. (28) To treat the carcasses of animals similarly, instead of throwing them about the town, or into holes, to be devoured by dogs, vultures, &c. (29) To utilize fully the provisions of the Compulsory Registration Act.

R. LIDDERDALE, M.D.,
Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

OFFICE OF THE SANY. COMMR. FOR BENGAL,
The 28th April 1884.

APPENDIX No. V.

REPORT SHOWING THE RESULTS OF THE ESTABLISHMENT OF BOVINE VACCINATION IN CALCUTTA IN 1883-84.

Second Report on Animal Vaccination in Calcutta for 1883-84, by Dr. K. P. Gupta, Superintendent of Vaccination, Metropolitan Circles.

Area and amount of work.

WORK was carried on in the Central Depôt at No. 85, Wellesley Street, and also at the Medical College Hospital, Municipal Office Vaccine Depôts in the town, and at the houses of private applicants both in Town and Suburbs. From April to December last calves were regularly sent to the above mentioned Depôts. In January the number of applicants at the Central Depôt began to increase, and the vaccinated calf was kept there from 7 to 9 A.M. to vaccinate them, and after that hour it was sent out either to the College Hospital, or to the houses of private residents. In February and March the demand for calf lymph both at the Central Depôt and outside became so great that it taxed all our resources to meet it.

The morning after the publication of Dr. McLeod's letter, warning the residents of Calcutta to get themselves vaccinated, some two hundred ladies and gentlemen presented themselves at the Depôt, and ever since numbers, varying from 50 to 100, have been coming every morning. The Deputy Superintendent in charge of Animal Vaccination worked hard, and vaccinated every applicant, specially ladies, with his own hands. After the Depôt work was over, the vaccinated calf was sent to the houses of private applicants, and it sometimes so happened it was out the whole day. A glance at the register of cases done at the Depôt and outside will show that calf vaccination has been very much appreciated and welcomed by all classes of Europeans and East Indians. From the Chief Justice and the Judges of the High Court and Secretaries to the Government of Bengal down to poor clerks and shopkeepers and petty traders, mercantile firms, banks and offices, have been vaccinated *en masse*. The primary vaccinations are shown in the following table.

	PRIMARY VACCINATION.					RE-VACCINATION.					GRAND TOTAL.

Wherever lymph direct from the calf was used, success was certain: so with good lymph in tubes and used by skilful operators. In cases of failure the causes of non-success were the mixture of serum, blood, and other impurities. In such the lymph is generally coagulated and comes out like a thread from the tube. The work of animal vaccination has interfered with the Municipal vaccinations in town. It has reduced their number much, but when people prefer bovine lymph to the humanised virus, it is nothing but right that there should be a Depôt for animal vaccination in Calcutta. One hundred and fifty-six calves were vaccinated from the very commencement in January 1883. It was, therefore, the 156th transmission up to 31st March.

Causes of Success and Non-success.

The percentage of success in re-vaccinations is very high. Some doubtful cases have been entered as successful. The gentlemen who were re-vaccinated returned their cases as successful when it is to be presumed that they were only doubtful. The percentage given is therefore not quite correct. Again, in many cases the results could not be ascertained, as the persons either left Calcutta or never took the trouble to send them.

Comparative value of Bovine and Humanised virus.

That the bovine lymph seems more potent appears from the following facts. The fever is stronger, and sets in earlier. The swellings and irritation of the lymphatic glands are always greater, and sometimes where humanised virus had failed bovine lymph has succeeded.

(*a*.) A gentleman who had a mild attack of small-pox several times got himself vaccinated with humanised virus without success. This year he was vaccinated with bovine lymph, and it proved successful.

(*b*.) Persons who have had small-pox and bear distinct and numerous pittings, have been successfully vaccinated with bovine lymph.

(*c*.) In the district the inspectors and vaccinators remarked that the virus was stronger, and never degenerated and died out as in former years.

(*d.*) In persons who were inoculated during childhood the bovine lymph has been successful, as I can testify from my personal experience. I was inoculated when a child and had a modified attack of small-pox in 1859 I got myself vaccinated with bovine lymph which has taken very well; but I do not consider it necessary in all cases. I did the experiment on my own person purposely. I don't think that persons who were inoculated and who had had small-pox also need be vaccinated.

(*e*) In re-vaccination cases with calf-lymph, the percentage of success is much higher than with humanised virus

(*f.*) Bovine lymph possesses another great advantage over humanised virus, *i.e*, we always have a plentiful supply whereby we can meet any sudden demand. Whenever reports of small-pox were received from the districts or tea gardens, supplies of bovine lymph were promptly sent, which could not be done with humanised virus.

There are certain facts in connection with animal vaccination that deserve particular mention. That it has been a great boon conferred on the public is beyond all question. The demands for lymph have been so great and urgent at times that it would have been simply impossible to meet them with humanised lymph I shall here mention certain facts which will prove the necessity of having a permanent depôt for animal vaccination in Calcutta.

(1.) A case of small pox was detected at Little Russel Street, on the evening of 9th March 1884. At 10 o'clock at night a letter reached the office stating that all the occupants were ready to pay anything if they could get themselves vaccinated that very night. The calf was accordingly sent, and the whole household were vaccinated at 11 o'clock that night.

(2.) A case of small-pox was detected on the *Resolute* lying at Diamond Harbour. The marine authorities deemed it necessary that the whole crew should be vaccinated as soon as possible. Intimation was given to this office on the evening of 24th March, and the next morning a calf and vaccinators were sent there, and the whole crew were vaccinated.

(3.) Surgeon-Major G. P. Mackenzie intimated to this office that he wanted the whole of the 4th Native Infantry to be vaccinated at once. The next day a calf was sent, and the whole regiment was vaccinated.

(4.) In Mercantile firms, Government offices, and schools, hundreds were vaccinated within a few hours' notice.

(5.) At times candidates for vaccination at the depôt have been more than a hundred between 7 and 9 in the morning. It would have been impossible to meet this demand with humanised virus.

(6.) Besides so many cases of vaccination every day in the depôt and in the town, 150 tubes of fresh lymph were regularly supplied every week to the Sanitary Commissioner.

(7.) The difficulty of establishing virus and carrying the same from place to place has this year been completely removed since tubes were supplied to all the inspectors and vaccinators belonging to the Metropolitan Circles, which enabled them to establish virus wherever required. So virtually there has been no expense for establishing virus in the different districts and villages of Bengal

These facts prove beyond doubt the necessity of having a permanent depôt for animal vaccination in Calcutta. That it has been quite a success is now fully demonstrated. With such an epidemic of small-pox and consequent panic as that through which Calcutta is just passing, we could never have safely tided over it. Small-pox has not raged, and the disease has been kept in check. There have been few cases among Europeans who took the warning in time and got themselves vaccinated.

Cost.

The total expenditure last year was Rs. 3,975-2-2, and dividing this by the number of vaccinations and re-vaccinations, *i.e.*, 3,678, the cost of each case comes to Rs. 1-1-3. The cost would be less if we got all the numbers done. But the number vaccinated does not represent all the work done by the establishment. Lymph stored in Dr Husband's capillary tubes has been supplied to all parts of the country. In the districts and circles the initial expense of raising lymph was saved by the use of calf-lymph.

While on the question of cost I would beg to suggest for the consideration of Government the following proposal, viz. that a fee of eight annas be charged for each vaccination done in the houses of private residents. This year about 1,352 cases were done in private houses, firms, and banks: we could have realised Rs. 676. It is but right that a small fee should be charged to those who wish to be vaccinated at home. The Compulsory Act provides a fee for "home vaccition," and I don't see any reason for offering gratuitous vaccination with calf lymph while we charge fees for vaccinating with humanised virus, and thereby putting the latter under a disadvantage.

In conclusion, it should be stated that the statement of primary and secondary vaccinations does not show every case done. Several gentlemen who came and got themselves vaccinated in the Central Depôt went away in hurry without entering or giving their names and particulars, and there was no time to ask them, as the pressure and crowding was great. Then again the Medical Officer of the 4th Native Infantry has not favoured this office with the names of the sepoys and camp followers, together with their children, who were vaccinated in their lines on three different occasions with calf lymph.

OFFICE OF THE SANY. COMMR FOR BENGAL,
The 24th May 1884.

OFFICE OF THE SANY. COMMR. FOR BENGAL,
The 24th May 1884.

R. LIDDERDALE, M.D.,
Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

MUNICIPAL DEPARTMENT.

SANITATION.

CALCUTTA, THE 15TH AUGUST 1884.

RESOLUTION.

READ—

The Report of the Sanitary Commissioner for Bengal for the year 1883, and the Report on Vaccination in Bengal for the year 1883-84.

Read again—

The Reports for the previous year, and the Resolution recorded upon them.

In explaining the cause of delay in submitting the present Report, the Sanitary Commissioner urges that "the time allowed for the collection and analysis of the vaccination statistics of this great Province is quite insufficient." Every endeavour was made to complete the Vaccination Report in time for its incorporation with the General Report on Sanitation. Monthly returns were called for, and the vaccinating season was curtailed to admit of the earlier submission of the final returns for the year. Nevertheless, the time occupied in compiling and examining the returns was more than is allowed under existing orders. Considering the importance which is attached to the submission of the Sanitary Report of this Province by the prescribed date, the Lieutenant-Governor trusts that still further endeavours will be made to ensure its punctual submission in the future.

2. The year under review was a comparatively healthy one, though unfavourable from an agricultural point of view. The average rainfall throughout the Province was 58·81 inches against 66·95 inches, the average of previous years Owing to the irregular distribution of rain, the harvest, and the rice crop in particular, failed to some extent, and, as a consequence, the prices for food-grains rose everywhere, except in the Burdwan and Balasore districts, causing privation and suffering among the poorer classes. The districts which suffered most in this respect were Maldah, Khulna, the Jehanabad sub-division in Hooghly, Loharduggа, Durbhunga, and Monghyr.

3. Very little, if any, improvement was effected in the registration of vital statistics during the year. The Sanitary Commissioner observes that "the usual attention was bestowed on the subject by most of the Magisterial and Police authorities in the way of inspecting the registers, testing the chowkidars' reports, and warning or punishing, legally or departmentally, the reporters or recorders for remissness or neglect. But, with very few exceptions, their efforts to improve registration were at best partial or desultory, not having the least pretentions to system, persistency, or permanence." The districts in which the greatest interest was shown in the work were Burdwan, Bankoora, Beerbhoom, Midnapore, Rajshahye, Hooghly, 24-Pergunnahs, Nuddea, Jessore, Rungpore, Bogra, and Monghyr. Mention is made in particular of the good work done by Major Ramsay and his subordinates in the district of Nuddea, which "resulted in marked improvement in registration." The recorded death-rate of the district was 36 per mille against 40 in the previous year. This may, however, be accepted as approximately correct; and as the Sanitary Commissioner observes, "it should be remembered that the fever mortality was severer in this district in 1882." It is gratifying to notice the hearty co-operation afforded by the Municipality of Midnapore in the promotion of registration in that town. The apathy which is reported to have been shown in the matter by the members of the vaccination establishment calls for severe censure, and the Sanitary Commissioner should take such practical notice as he may think required of the conduct of those in fault.

4. Of 114 towns to which the Compulsory Registration Act IV (B C.) of 1873 has been extended, in only 25 were its provisions actually enforced. The total number of prosecutions instituted during the year was 297 with 232 convictions, against 235 with 182 convictions in 1882. The largest number

of prosecutions was instituted in the Suburbs of Calcutta and in Howrah. The result, though an improvement on that of the previous year, is still very unsatisfactory. The Lieutenant-Governor learns with regret that there appears to be generally no person appointed to detect and report evasions of the law, and that it is overlooked that the chowkidar is bound under penalty by section 6 of the Act to report every birth or death occurring in his beat to the Registrar. Ample provision is made in the law to ensure proper and effectual registration, and when the results are defective, as is found to be the case in most districts, it is evident that advantage has not been taken of this provision. The Sanitary Commissioner reports that "the views of Government on the subject, contained in paragraph 4 of the Resolution on the Annual Report for 1882, were conveyed to the Magistrates for communication to the municipalities in their districts, and quarterly statements of prosecutions instituted were called for, and are being submitted." Better results will be looked for in the next annual report.

5. Births were registered in 46 towns against 45 in 1882, the number recorded, exclusive of 1,437 children still-born, being 37,215, or a ratio of 22·08 per mille of the total population of the towns under registration, against 37,198 with a ratio of 22·65 recorded in the previous year. This apparent incongruity (increase in the number with a decrease in the ratio of births to population) is explained by the fact that the population and births of the town of Cuttack, which had no place in the statistics of 1882, are included in those of the year under review. The results recorded in the last two years are closely similar. The towns in which the best results were obtained are—

	1883	1882		1883	1882
Jamalpore in Monghyr .	49 17	4 79	Bhagulpore	33 64	37 87
Revilgunge	37 30	29 93	Brahmunberiah	33 16	35 11
Baulcora	34 93	31 47	Sitamurhi	31 34	37·22
Behar ...	34 12	32 75	Bettiah	3 47	29 11
Jamalpore in Mymensing ...	34 21	40 64	Gya	29 38	33 78
Mokamah	33 88	23 75			

In all these towns, with the exception of Bhagulpore and Gya, the birth-rate was in excess of the death-rate. The following table shows the number of births according to sex, and the proportion per cent. of male to female births :—

Sex	In 1883			In 1882		
	Number of births	Ratio per 1 000 of population.	Proportion per cent of male to female births	Number of births	Ratio per 1 000 of population	Proportion per cent of male to female births
Males	19,872	11 79	114	20,010	12 20	117
Females	17 343	10 29		17 158	10 44	

The preponderance of male births still continues to be a noticeable feature in the record of birth registration, illustrating the theory "that the proportion of male to female births is influenced by the relative ages of husband and wife, the male births increasing as the age of the husband preponderates over that of the wife, as is notably the case in India."

6. There was a considerable decrease in the number of deaths recorded in the selected areas during the year, the total, exclusive of 18,225 still-born children, being 1,245,676 against 1,349,651 recorded in 1882. Dr. Lidderdale rightly hesitates to infer that these figures afford either an absolute or a comparative gauge of the real mortality of the two years respectively. Registration, as he says, is "still lamentably defective." "It has improved so far only as to yield a return which bears a somewhat closer approximation to the true death-rate than the outcome of some former years, and to afford indications of the health condition of the people." This is certainly as much as can be said of returns which for 27 out of 45 districts give a death-rate of less than 20 per mille. It is of course beyond dispute that the number of deaths registered even in 1882 was much less than the number which occurred in 1883. It would, indeed, be reasonable

to suppose that in the case of such a disease as cholera, which is well recognized among the people, a large decrase in the number of deaths registered indicated an actual decrease of mortality from this cause : and when it is found that local reports, apart from statistical data, are to the same effect, a generally sound conclusion as regards the incidence of this malady may be arrived at. In regard to such affections as fever and bowel-complaints, however, no deduction from the registered figures is yet possible, and the general reports are the only material available for the formation of a judgment upon the condition of the public health. The Sanitary Commissioner remarks that "a larger number of the registering circles failed to record deaths at the higher rates of 20 to 50 and above per 1,000 of population. In 1882 354 of the 644 registering circles contributed to these rates; this year 307 of the 648 circles furnished them." Large omissions are traceable in most of the districts, especially in Darjeeling, Mymensingh, and the Sonthal Pergunnahs. The provisions of Act IV (B.C.) of 1873, so far as relates to the registration of deaths only, have recently been extended to that portion of the Darjeeling district which lies to the west of the Teesta river, and the result of the measure will be to secure some record of the deaths in this tract where registration has hitherto been partically ignored.

7. The proportions in which the urban and the rural circles contributed to the total number of deaths recorded during the year are as follow :—

	In 1883.		In 1882.	
	Deaths.	Ratio per mille.	Deaths.	Ratio per mille.
Urban	67,383	27·28	76,601	31·05
Rural	1,178,293	18·49	1,273,050	20·00
Province	1,245,676	18·82	1,349,651	20·41

These figures exhibit a diminution in both the urban and rural circles, the former to the extent of 9,218 deaths, or at 3·77 per mille of population, the latter to the extent of 94·757 deaths, or at 1·51 per mille. The following table shows the mortality during the year from specific causes as compared with that for the year 1882 and the quinquennium 1878-82:—

Name of Disease.	Proportion of deaths per 1,000 of population								
	In 1883.			In 1882.			In 1878-82.		
	Urban.	Rural.	Province.	Urban.	Rural.	Province.	Urban.	Rural.	Province.
Cholera	3·64	1·27	1·36	4·79	2·67	2·75	3·43	1·53	1·61
Small-pox	·27	·14	·14	·34	·20	·20	·80	·27	·29
Fevers	13·77	13·81	13·81	15·72	14·00	14·06	16·14	11·70	11·87
Bowel-complaints ...	3·54	·73	·83	3·93	·81	·92	4·19	·71	·85
Injury	·40	·35	·35	·88	·32	·32	·43	·32	·33
Other causes	5·64	2·18	2·30	5·80	1·98	2·12	5·87	1·64	1·80
All causes ...	27·28	18·49	18·82	31·05	20·00	20·41	30·88	16·20	16·75

Cholera, small-pox and bowel-complaints would appear to have proved less fatal in 1883 than during the entire period 1878 to 1882. Fever was, according to these figures, less severe than in 1882, though considerably more so than in the quinquennium, 1878-82. The number of reported casualties from injury and other causes was slightly higher. The statistics collected during the year "again indicate that the cold or dry season is the unhealthiest in the Province, as it is during this period that cholera, fever, and bowel-complaints cause the greatest loss to life." The recorded mortality among infants is still very high, though the recorded urban ratio 178·70 is below that of England, which is said to be 182·6. The death-rates per mille of population according to nationalities were—Christians 12·52, Hindus 18·45, Mahomedans 19·91, Bhuddists 11·84, other races 15·21. The casualties among the Bhuddists was higher than it has been during any year since 1878.

8. The birth-rate in Calcutta was below that recorded for the other Bengal towns, while the death-rate was higher, being 17·15 and 28·44 respectively, against 22·08 and 27·28. The remarks that were made on the statistics furnished in the report for 1882 apply to those contained in the present report. Owing probably to a more correct diagnosis, the death-rate

from fever is shown to be less, and the death-rate from "other causes" to be greater in Calcutta than in the other Bengal towns. The average mortality in the cantonments in Bengal, with a population of 33,991, rose from 13·35 per mile in 1882 to 21·50 per mille in the year under review, the chief cause of death being fever. The death-rate was highest in the Hazaribagh Cantonment. Only one death took place in Fort William. Of 21,005 European seaman who visited the Port during the year, 1,948 were admitted into hospital, of whom 81 died. There were 10 casualties besides, which occurred out of hospital. The death-rate was less than in the previous year, being 48·92 per mille against 55·80. The number of deaths among the native floating population was 178 against 186, or at the rate of 7 per mille against 7·32 in the previous year, cholera being the chief cause of death. The Native Inspector, who has been appointed to surpervise the floating population, is reported to have done his best to trace cases of sickness, and get them removed to hospital. In alluding to the healthiness of the Port during the year, the Sanitary Commissioner records the following remark, which the Lieutenant-Governor gladly reproduces: "On the whole, therefore, the year under review must be pronounced to have been a healthy one, which is a matter for congratulation, and indicative of the care and attention bestowed by the Health Officer on the sanitation of the Port."

9. Unlike the year 1882, the most prominent feature in the sanitary report for the Province during 1883 was the decrease in the registered mortality from cholera in both urban and rural circles. "The disease was present in all the 648 registering circles in the Province excepting 46, prevailing epidemically in only 47 against 115 in 1882, severely in 64 against 118, and mildly in 491 against 376, and it attacked only 6·55 per cent. of the villages against 10·98 per cent. The casualties amounted to 90,439, and the death-rate to 1·36 per 1,000 of population, the reduction on the figures of 1882 being 91,913 deaths, or at 1·39 per 1,000, and on the average of the lustrum, 1878-82, 16,107 deaths, or at ·25 per 1,000." The following statement shows the comparative registered mortality from cholera in urban and rural circles :—

	In 1883.		In 1882.	
	Deaths.	Ratio per mille.	Deaths.	Ratio per mille.
Urban circles	8,993	3·64	11,830	4·79
Rural "	81,446	1·27	170,552	2·67

The districts which would appear to have suffered most were Nuddea (4·69), Julpaiguri (4·17), Gya (3·73), 24-Pergunnahs (3·47), Shahabad (3·24), Howrah (3·00), Backergunge (2·40), Jessore (2·21), Darjeeling (2·12), Balasore (2·12), and Cuttack (1·95). A noticeable feature in the cholera history of the year is the progress of the disease in the Darjeeling district. "Commencing in the Terai, the disease spread over the whole district with epidemic virulence, excepting the large hill tract east of the Teesta and several villages west of that river. Localities which had not been visited since 1877 were invaded this year; tea-gardens and other places further in the hills than Darjeeling were attacked; plains and hills were both affected; the Darjeeling Municipality at an elevation of over 7,000 feet did not entirely escape." The recorded death-rate, which is believed to have been considerably under-stated, was 2·12 as stated above against ·35 per mille in 1882. The disease was most severe in the dry and hot months of April, May, and June, and as usual subsided during the rains. The reports of the year continue to show that the disease, however propagated, is "fostered by the filthy habits and overcrowding of the population." Some attempt was made by the Civil Surgeon of Gya to discover the etiology of the disease, which broke out simultaneously in many parts of that district with unusual virulence; but although he visited many of the affected localities, his enquiries led to no satisfactory result. The conclusion he arrived at was "that the disease spread irrespective of lines of traffic, and that the prevailing winds did not influence its course." In no instance was the disease traced by him to importation. The subject of the origin and propagation of cholera is attracting much attention at present in consequence of the important discoveries which are thought to have been made by Dr. Koch and the German Cholera Commission. The Government of India have resolved to institute special enquiries, and have deputed for this purpose Dr. D. D. Cunningham, an officer of exceptional qualifications. Instances were brought

to notice in which cholera was imported by coolies on their way to Assam, the medical arrangements for their charge being defective. Measures are being taken to ensure a more efficient supervision in future; and at Mugra, in the district of Hooghly, through which large numbers of coolies pass during the first half of the year, arrangements have been made to provide for their medical inspection and treatment when sick. It is not, however, possible, in the present state of the law, to enforce sanitary regulations in the case of free labourers. The conduct of the Nawab Bahadoor of Moorshedabad, and of the Rajah of Deo, and Zemindars Sham Lall Mitter and Nundo Lall Bose of Gya, in affording medical relief to the cholera-stricken among their tenantry, is highly commendable.

The attention of the Suburban Municipality was drawn to the remarks made in the last report on the condition of certain bustees in the suburbs, and the Commissioner and Magistrate of the district were requested to give their personal attention to the matter. The Lieutenant-Governor has also recently called for a report on the condition of the bustees near Cossipore. During the year the Lieutenant-Governor announced his intention of relieving the Municipality of a charge of Rs. 38,000 a year on account of police to assist the Commissioners in making adequate provision for the extension of filtered water to the suburbs. A portion of the funds thus set free was also to be devoted to the sanitary improvement of the Municipality. The whole question of the measures to be taken for the reform of the suburban bustees is under consideration.

10. Small-pox played a comparatively minor part during the year under review, the recorded number of deaths from that disease being 9,714, or a ratio of ·14 per mille of population, against 13,651, or a ratio of ·20 in the previous year. With the exception of the years 1875 and 1877, when the number of deaths recorded was 5,280 and 8,088 respectively, the mortality from small-pox in 1883 was lower than that of any year of the preceding decade. It is hoped that still better results will ensue as the value of vaccination becomes more generally known and appreciated. The disease prevailed with more or less severity in 30 circles against 33 in 1882, and was absent from 284 against 280. The proportions in which the urban and rural circles contributed to the total mortality are as follow :—

	In 1883.		In 1882.	
	Deaths.	Ratio per mille.	Deaths.	Ratio per mille.
Urban circles	672	·27	853	·34
Rural "	9,[illegible]42	·14	12,798	·20

The disease was found to be specially prevalent during the hot months of March to June. The largest number of casualties occurred among infants and children under 12 years of age, the proportion of deaths among them to total deaths being 71·04. The districts which suffered most were Cuttack (1,570), Pooree (841), Chumparun (657), and Mymensingh (643). Bogra was the only district in Bengal which enjoyed perfect immunity from the disease throughout the year.

11. The total registered mortality from fever was 913,766, the death-rate being 13·81 per mille of the population under registration, against 929,943 with a death-rate of 14·06 per mille in 1882, showing a reduction of 16,177 in the number of deaths, and of ·25 per mille in the death-rate. The comparative mortality registered in urban and rural circles during the last two years is shown in the following statement:—

	In 1883.		In 1882.	
	Deaths.	Ratio per mille.	Deaths.	Ratio per mille.
Urban circles	34,025	13·77	38,792	15·72
Rural "	879,741	13·81	891,151	14

The seasonal incidence of fever, as illustrated by the mortuary statistics recorded during the year, again shows that the disease is most fatal in the cold weather after the rains have ceased, especially during the months of November and December "when the sodden soil is rapidly drying, and there is a great daily range of temperature." As in the previous year, the disease was most virulent in the Burdwan, Presidency, and Rajshahye Divisions.

The districts which suffered most, and the mortality recorded in each, compared with the figures for the previous year, are given in the subjoined table:—

Districts.	In 1883 Deaths	In 1883 Ratio per mille	In 1882. Deaths.	In 1882. Ratio per mille
Rajshahye	40,331	30.12	32,450	24.24
Nuddea	45,705	27.[illegible]0	60,912	30.50
Burdwan	32,502	23.35	40,173	28.86
Jessore	41,882	23.14	34,[illegible]9[illegible]	22.93
Pubna ...	29,43[illegible]	22.43	23,575	17.97
Beerbhoom	17,698	22.27	21,945	27.62
Moorshedabad ...	2[illegible],734	21.79	31,921	26.01
Bogra ...	11,181	19.31	14,487	19.72
Khulna ...	18,941	17.53	20,144	18.65
Dinagepore ...	26,014	17.17	23,618	15.61

These figures indicate a diminution in the fatality of the disease in nearly all the districts named, the exceptions being Rajshahye, Jessore, Pubna and Dinagepore. In Rajshahye, where the public health has been gradually deteriorating, the chief cause of suffering is attributed to a deficient and vitiated water-supply. The remarks of the Civil Surgeon on the subject will be brought to the notice of the Commissioner of the Division It is satisfactory to see that the virulence of both the Burdwan and the Nuddea fevers is diminishing, the former at a rapid rate. There are, however, signs that it is spreading into adjoining districts, such as the Sonthal Pergunnahs, which have hitherto enjoyed a happy and remarkable immunity. Of the local enquiries instituted into the cause of fever in the various districts of the Province, mention is made in particular of the enquiry made by Dr. Ghose, Civil Surgeon of Bankoora, which has led him to form the opinion that "soil moisture is not *per se* the cause of fever, but that so long as the contagion, whatever it might be, was not introduced either by human agency or from village to village by the wind, the humidity of the soil did no harm, but the contagion once falling on congenial ground multiplied in abundance, in proportion to the soil moisture, and caused the disease. Where the moisture in the soil, owing to the proximity of a marsh, is perennially damp, there the fever prevails the most." The Civil Surgeon of Maldah remarks that "groups of people congregated thickly together in villages surrounded by soil sodden and saturated by the excremental discharges of years little or no ventilation, air poisoned by the miasmatic exhalations of decaying animal and vegetable debris, and water rendered impure by nature and art, are all quite sufficient to account for the spread, if not the origin, of disease in an Indian village" · Only four deaths occurred from fever among European seamen in the Port of Calcutta, although the number of cases admitted in hospital exceeded that of the previous year, being 323 against 251. This is chiefly owing to the absence from the Port of enteric fever during the year. There was a decline also in the mortality from fever among the native floating population, the recorded number of deaths being 22 against 26 in the previous year.

12. Under the heads of "Bowel-complaints," "Injury," and "Other diseases," the recorded mortality during the year stands at 55,270, 23,670, and 152,817, respectively Compared with the figures of the previous year, there was a decrease of 6,092 in the number of deaths from "Bowel-complaints," and an increase of 2,059 and 12,085 respectively in the casualties from "Injury" and "Other diseases." Under "Injury" the largest proportion of deaths was caused by snake-bite and attacks of wild beasts. Referring to the statistics indicating the seasonal incidence of bowel-complaints, the Sanitary Commissioner observes "that the morning and evening damps and chills and great alternations of temperature of July, August, and September, and the extreme cold night air and heavy dews of January, November, and December, cause large numbers of the poor, insufficiently clad, and poorly fed portion of the population to succumb to the influence of these maladies. To these causes may be added errors of diet, bad water, and malaria as aids to the propagation of the diseases"

13. Considerable progress was made by the Vaccination Department during the year. The operations of the Government vaccinators were extended for the first time to three thannas in the Monghyr district, seven thannas in the

Tipperah district, six thannas in the Chumparun district, two thannas in Shahabad and a portion of Jehanabad in the district of Gya. The area thus protected for the first time occupies 6,179 square miles, and contains a population of 3,800,888. On the other hand, five thannas in the Purneah district, seven thannas in the Maldah district, and three thannas in the district of Bhagulpore, which cover an area of 4,416 square miles, and contain a total population of 1,916,568, were for the first time placed under the licensed system of vaccination. The whole of the Darjeeling Circle, with the exception of the hill tracts, is now vaccinated by licensed agency. In addition to the areas dealt with in former years, the areas which were thoroughly protected at the close of the season 1883-84 comprised 37,969 square miles, with a total population of 15,014,069. The circles in which the largest areas were brought under protection were Ranchi and Eastern Bengal. The following table shows the recorded number of operations performed during the year:—

CIRCLES.	Total number of vaccinations performed		Difference in 1883-84.	
	* In 1883-84.	In 1882-83.	Increase.	Decrease.
Calcutta	9,538	11,373	...	1,835
Metropolitan circles	342,543	344,178	...	1,635
Suburbs of Calcutta, including Cooly Depôts	14,397	15,152	...	755
Total of Metropolitan Circles ...	356,940	359,330	...	2,390
Darjeeling Circle	221,536	282,291	...	60,755
Ranchi „	146,283	110,893	35,390	...
Sonthal Pergunnahs „	106,985	134,571	...	27,586
Eastern Bengal „	351,016	212,518	108,498	...
Orissa „	52,542	43,858	8,684	...
Behar „	39,627	17,487	22,140	...
Total of Vaccination Circles ...	1,234,467	1,202,321	82,146	...
Municipalities, Dispenseries, &c. ...	76,865	59,104	17,761	...
GRAND TOTAL ...	1,361,332	1,261,425	99,907	

* Inclusive of 10,780 repetition cases in the vaccination circles and 139 in the municipal area, aggregating 10,919.

These figures do not include the number of operations performed at the Inland Emigration Cooly Depôts for the six months ending December 1883, nor do they include the work done by 32 of the vaccinators in the Eastern Bengal Circle, whose returns were received by the Superintendent after his annual statements had been closed. Nevertheless they exhibit a satisfactory increase in the number of operations performed both in the vaccination circles and in the municipal area. The large decrease in the Darjeeling Circle is accounted for in "the change from Government to licensed agency operations in Maldah and Purneah, the Government agency on the hills having returned an excess of 6,929 operations. It is also attributed to the difficulty of securing subjects to serve as vaccinifers, which prevented the more vigorous pushing on of operations in Bogra, Rajshahye, and Rungpore, and to some extent to opposition to vaccination in the two first-named districts." The reasons given for the falling off in the number of vaccinations in the Sonthal Pergunnahs Circle are not at all satisfactory, and only tend to show the laxity which prevails in the supervision of the vaccinating establishment in this circle. Now that a separate Superintendent has been appointed, it is hoped that a substantial improvement will follow.

14. The number of successful operations performed during the year in the vaccination circles and the municipal area combined was 1,329,828 against 1,229,058 in 1882-83, the percentage of successful primary cases being 98·66 against 98·60, and of secondary cases 49·42 against 45·12. A higher standard of success was returned by the Calcutta, Metropolitan, Darjeeling, Sonthal Pergunnahs, and Eastern Bengal Circles than by the Ranchi, Behar, and Orissa Circles. There was an improvement also in the number of successful

primary operations in the municipal area. Of 1,261,771 persons who were successfully vaccinated in the vaccination circles during the year, 1,275,750 were under one year of age, 836,258 were between one and six years, and 259,077 were above six years. In the municipal area the general results are found to accord with those common to the majority of the vaccination circles. It is supposed that "the main reason why a larger ratio of protection is seen among children above one and under six years of age than among infants is that parents or guardians (particularly mothers) greatly fear to expose children of tender age to vaccination, which is considered to be attended with much risk" The following is a comparative statement of the amount and value of the work performed by the Government and licensed agencies:—

Agencies	Circles in which employed	Number of vaccinators employed	Total number vaccinated during the year	Primary Vaccination: Total	Primary Vaccination: Successful: Under one year	Primary Vaccination: Successful: One year and under six years	Primary Vaccination: Successful: Above six years	Primary Vaccination: Successful: Total at all ages	Re-vaccination: Total	Re-vaccination: Successful: Under one year	Re-vaccination: Successful: One year and under six years	Re-vaccination: Successful: Above six years	Re-vaccination: Successful: Total at all ages	Percentage of successful cases: Primary	Percentage of successful cases: Re-vaccination	Average number of persons vaccinated by each vaccinator	Proportion of persons successfully vaccinated per 1,000 of population
Licensed agency	Metropolitan, Darjeeling, Ranchi, Sonthal Pergunnahs and Eastern Bengal	972	893 056	890 198	124,073	607 304	145,797	877 714	2 86	8	264	2,026	2,298	98 81	82 15	938	19 1
Government agency	Calcutta, Suburbs of Calcutta, Darjeeling, Ranchi, Sonthal Pergunnahs, Eastern Bengal, Orissa and Behar	323	291 112	385 500	41 710	228 405	110 071	380,186	5 904	45	285	1,243	1,573	99 08	29 50	1 204	8 2

The work performed by the licensed agency was considerably better than that performed by the Government agency. The number of operations performed by each licensed vaccinator was, however, less than that performed by the Government vaccinators. The relative proportions of the various classes vaccinated to the total number of vaccinations were:—

	Percentage of total vaccinations.
Christians ...	·32
Hindus ...	56 87
Mahomedans	38 35
Others ...	4 44

15. The public feeling in regard to vaccination continues to grow in favour of the measure, though opposition is still exhibited in every circle. "The most backward districts are Hazaribagh, the Kolhan portion of Singbhoom, Monghyr, and the districts comprising the Behar and Orissa Circles, excepting Patna in the former circle—the stoutest opponents are the higher classes of Hindus, the Marwaris, and the Mahomedan Ferazees—and the chief causes of aversion to the measure are objections based on religious grounds; leading members of communities setting a bad example and inciting the lower classes to resistance, the females having a strong objection to the measure, while the males are unable to set aside their entreaties; unwillingness to part with the virus from the arm; objection to arm-to-arm vaccination; bad vaccination engendering disbelief in the protective powers of the prophylactic." The Lieutenant-Governor learns with satisfaction that considerable assistance was afforded by many of the District and Sub-divisional Officers, and by a few private individuals, in promoting the cause of vaccination. The Commissioner of Orissa will be asked to report further on the statement that "the Magistrates of Cuttack, Balasore, and Pooree, although asked, declined to render assistance on the ground that vaccination is not compulsory." The Lieutenant-Governor desires to be further informed of the proceedings of the Sub-divisional Officer of Bagirhat, who refused to see the Deputy Superintendent of Vaccination on the ground of being otherwise engaged.

16. The Compulsory Vaccination Act, V (B.C.) of 1880, was extended during the year to the places mentioned below:—

Burdwan District—
Burdwan town.
Ranigunge „
Kalna „
Dainhat „
Cutwa „
Bankura District—
Bankura town.
Bishenpore „
Midnapore District—
Midnapore town.
Kheerpai „
Ghatal „
Chundrakona „
Ramjibanpore „
Tamlook „
Hugli District—
Bhuddesher town.
Bansbaria „
Bydobati town.
Kotrung „
Serampore „
Utterpara „
24-Pergunnahs District—
North Suburban or Baranagur town.
South Suburban town.
Rajpore „
Barripore „
Joynagar „
South Dum-Dum „
North ditto „ including cantonment
South Barrackpore town, including Cantonment.
North Barrackpore town.
Baraset town.
Naihati „
Basirhat town.
Taki „
Baduria „
Gobardanga „
Nuddea District—
Krishnagar town
Santipore „
Ranaghat „
Nuddea „

Jessore District—
Jessore town.
Mohespore „
Kotechandpore „
Khulna District—
Satkhira town.
Chanduria town.
Debhata „
Murshedabad District—
Berhampore town, including Cantonment.
Lalbagh town.
Kandi „
Jangipore „
Maldah District—
English Bazar town.
Cuttack District—
Cuttack Cantonment.
Bhagulpore District—
Bhagulpore town.
Kolgong „
Bhagulpore thana.
Kumargunge „
Kolgong „
Bihipore „

The reports of the year show that the law was introduced into the places named without much opposition, and was found to work satisfactorily. Both the Civil Surgeon of Midnapore and the Cantonment Magistrate of Dum-Dum consider the existing law to be defective in so far as it does not give the local authorities absolute power in the enforcement of its provisions. The Act continued to work smoothly in all the places to which it had been previously extended, with a few exceptions, principal among which was the town of Gya, where the wealthy class of Hindus and the priests of the old town of Gya were the most determined opponents. Six hundred persons were prosecuted for resistance, and of this number 36 were fined Rs. 105-8, the rest being discharged with a warning, which had a wholesome effect. The fees realized during the year from home vaccination, which was carried on in addition to depôt vaccination, were—in Gya Rs. 153-4, in Monghyr Rs. 111-8, and in Jamalpore Rs. 25-8. Notwithstanding the measures taken to prohibit the practice of inoculation, it was found to have been carried on clandestinely in many parts of the Province, and much of the good effected by vaccination was thereby counteracted. The protection afforded by vaccination against small-pox is again proved by the results of the past year, which show that, while the mortality from small-pox in the areas *unprotected* by vaccination stood as high as ·25 per 1,000 of population, it amounted in the *fairly well protected* areas to only ·17 per 1,000, and in the *thoroughly protected* areas to the still lower ratio of ·07 per 1,000.

17. The principal feature in the history of vaccination during the year was the great increase in the use of bovine lymph. Experiments were freely made throughout the Province, and the results were generally as successful as those achieved by the use of humanized lymph. Its efficacy was found to be greater when used direct from the calf than when transmitted in tubes. The following opinion is recorded by Dr Gupta, whose experiments with the bovine virus in Calcutta were well conducted :—"Whenever lymph, direct from the calf, was used, success was certain : so with good lymph in tubes and used by skilful operators. In cases of failure the causes of non-success were the mixture of serum, blood, and other impurities. In such the lymph is generally coagulated, and comes out like a thread from the tube. That the bovine lymph seems more potent appears from the following facts. The fever is stronger and sets in earlier. The swellings and irritation of lymphatic glands are always greater, and, sometimes, where humanized virus had failed, bovine lymph has succeeded. In the districts (comprising the Metropolitan Circle) the inspectors and vaccinators remarked that the virus was stronger and never degenerated and died out as in former years. In persons who were inoculated during childhood, the bovine lymph has been successful. In re-vaccination cases with calf lymph the percentage of success is much higher than with humanized lymph. Bovine lymph possesses another great advantage over humanized virus, viz, that we always have a plentiful supply whereby we can meet any sudden demand." Vaccination with bovine lymph is now greatly appreciated, especially by the Christian community.

It is said that the demands for it during the year were so numerous that the establishment was barely able to cope with them. In no less than 1,352 instances the calf was required to be taken for vaccination to the houses of private persons, and a proposal is now made to charge a fee in such cases in order to meet the expenditure involved. The Sanitary Commissioner considers that it is fully time that the bovine vaccination scheme should be made a permanent institution, and the Lieutenant-Governor will be glad to consider any specific proposals that may be made with this object.

18. The total expenditure on vaccination during the year amounted to Rs. 1,31,274-1-4 against Rs. 1,24,083-12-6, the total expenditure in the previous year, exhibiting an increase of Rs. 7,190-4-10. Of the total expenditure, Rs. 58,518-2-9 represents the cost of the operations conducted by the Government establishment, Rs. 63,910-3-8 that of the establishment provided by Government for supervising the operations of the licensed vaccinators, and Rs. 8,845-10-11 the cost of vaccination to municipalities. In addition to the regular expenditure, several sums received as private contributions were expended in aid of the work. The cost of each successful operation performed by the Government agency was 2 annas $5\frac{1}{3}$ pies, and that by the licensed agency 1 anna $1\frac{3}{4}$ pies, aggregating 1 anna $6\frac{1}{2}$ pies for both departments, or $\frac{1}{4}$ pie less than the aggregate of the previous year.

19. The percentage of municipal income which was expended on sanitary works during the year was 34 against 31 in the previous year, and on roads it was 18, the same as in 1882. The following table shows the special purposes for which the amount allotted for the sanitation of towns was expended.

Nature of Work.	Total Cost.		Difference in 1883.	
	In 1883.	In 1882.	Increase.	Decrease.
	Rs.	Rs.	Rs.	Rs.
Conservancy, including latrines ...	3,07,951	2,61,509	46,412	......
Ditto establishment	3,25,860	3,12,757	13,103	......
Drainage	96,097	1,36,775	......	40,678
Water-supply	1,60,449	31,092	1,29,357	......
Disposal of the dead	7,629	6,917	712	......
Markets and slaughter-houses ...	16.533	14.170	2,363	......
Vaccination	10,992	12,018	......	1,506
Treatment of the sick	1,69,339	1,24,993	44,346	......
Other sanitary works	53,080	55,168	......	2,088
Total ...	11,47,930	9,55,429	1,92,501	43,822
Construction, maintenance, and repair of roads	6,06,160	5,70,200	35,960	......
Total, including roads ...	17,54,090	15,25,629	2,28,461	43,822

The large increase under the head of water-supply was chiefly owing to the expenditure on the Burdwan water-supply scheme, which amounted to Rs. 1,10,519; to the extension of the Darjeeling water-supply to Kurseong at a cost of Rs. 10,523; and to the improvement of defects in the water-works at Dacca, which cost Rs. 2,638. The districts in which the largest proportion of municipal income was devoted to sanitation were Julpigoree, Rungpore, Sonthal Pergunnahs, Hazaribagh, and Burdwan. Those in which less than an equitable share of municipal income was expended on sanitary improvements were Khoolna, Mymensingh, Noakholly, and Chittagong.

20. Schemes for the improvement of drainage were inaugurated, and in most cases taken in hand in Serampore, Ghattal, Berhampore, Lalbagh, Azimgunge, Dinagepore, Chittagong, and English Bazar in Maldah. Some progress was made in the Cuttack drainage scheme, which was commenced in 1879. Obstructions to drainage were removed in Nuddea, Moorshedabad, and Dinagepore. In the Sonthal Pergunnahs, a survey of the great swamp to the south of Rajmehal, which is a source of much disease, was made with a view to improve its drainage. Since the close of the year a report has been submitted on this subject, but as it appeared to the Lieutenant-Governor that the efforts made by the local landholders, who would be the chief gainers, were quite inadequate, he declined to grant any assistance from Provincial funds. Much progress was made during the year towards the completion of the Burdwan water-supply scheme, and some good work was done in improving the water-supply in the towns of Berhampore, Dacca,

English Bazar, and Kurseong. A Bill to provide for the extension of the Calcutta water-supply to the Suburbs has been introduced in the Legislative Council, and it is hoped that, in the course of the current year, material progress will be made with the works. A scheme has also been proposed to provide a supply of filtered water for all the riparian municipalities on the right bank of the Hooghly, from Howrah to Serampore. The difficulties in the way of carrying this into effect have been found more considerable than was anticipated, and some delay is likely to ensue before the details are worked out. The Lieutenant-Governor, however, attaches a high degree of importance to it, and he would be very reluctant to admit that the obstacles are altogether insuperable. Every assistance that can legitimately be given will be rendered, and it is hoped that before long some feasible solution will be discovered. Meanwhile the proposal is under the consideration of Government.

21. The Lieutenant-Governor is again compelled to notice unfavourably the comparatively small amount of sanitary work done by officers of the Department. This subject was prominently alluded to in the Resolution recorded last year, and in view of the instructions then issued by the Sanitary Commissioner, and the remarks made by Government, it was hoped that the records of the year under review would show a marked improvement in this respect. Some slight advance there is, but much less than the Lieutenant-Governor considers he has a right to expect. It should be distinctly understood that the primary duties of the department under the Sanitary Commissioner are of a sanitary nature. Vaccination is merely one branch of a subject which embraces all matters affecting the public health. There has been in the past a marked tendency on the part of the Sanitary Department to magnify its vaccination duties at the expense of those of a more general character. It was to check this tendency that the Lieutenant-Governor desired the Sanitary Commissioner to prescribe forms of diaries and to lay down rules to secure a greater amount of attention to sanitary work proper. It is therefore disappointing to find in a Report, which, exclusive of appendices and figured statements, extends to 107 printed pages, only six pages devoted to this subject. The Lieutenant-Governor is aware that Dr. Lidderdale resumed charge of the office of Sanitary Commissioner only a few days before the close of the year to which the Report relates, and he is therefore not responsible to a great extent for the shortcomings in question. Mr. Rivers Thompson trusts that the Sanitary Commissioner will now take such measures as will ensure that in the current year the disproportionate division of the attention of his Department between the several branches of their work may be thoroughly rectified.

By order of the Lieutenant-Governor of Bengal,

COLMAN MACAULAY,

Secretary to the Government of Bengal.

Personal Proceedings.

APPENDICES.

SEVENTEENTH ANNUAL REPORT

OF THE

SANITARY COMMISSIONER FOR BENGAL.

YEAR 1884.

SECTIONS I, II, III, & IV.

THE information required under these Sections will, as usual, be submitted in the Imperial Sanitary Commissioner's Report, and is consequently omitted from this Report.

SECTION V.

VITAL STATISTICS.

Statistics dealt with in this Section.

2. This Section deals with particulars connected with the birth statistics of 47 principal towns, and the death statistics of the entire Province for the year 1884.

REGISTRATION. Value of—in 1884.

3. The general results of Birth and Death registration during the year under review are exhibited in the subjoined tables:—

BIRTHS.

Districts.	Number of towns in each district in which Births were registered.	Number of Births registered in 1884.	Ratio of Births per 1,000 of Population in 1884.	Increase or decrease as compared with 1883.	Ratio of male Births to every 100 female Births.
1. Chumparun ...	1	748	35·17	4·70 *I*	108
2. Mymensing ...	1	555	34·40	·25 *I*	115

	Number of Circles in which Deaths from *All Causes* were registered at—						
	50 and above per mille.	40 to 50 per mille.	30 to 40 per mille.	20 to 30 per mille.	15 to 20 per mille.	10 to 15 per mille.	Under 10. per mille.
In 1884	4	25	71	271	172	92	14
In 1883	2	19	80	206	189	119	33

The inferences to be drawn from the figures for the year under review in comparison with those for the preceding year, as submitted in the above tables, are:—

(1) That there was an advance in Birth registration in the towns in which the events were recorded, viz., to the extent of 2,425 additional births registered, or at the rate of 1·43 per 1,000 of population.

(2) That to this advance all the 47 towns, excepting 15, contributed.

(3) That a very considerable improvement in death registration was effected in the Province, represented by the increase of 1,32,934 in the number of deaths recorded, or at 2·01 per 1,000 of the population under registration.

(4) That all the 45 districts, excepting 11, produced this improvement.

(5) That a larger number of circles, 371 against 307, recorded deaths at the superior rates of 20 and above per 1,000 of population.

(*Lastly*) That compared with the results of all past years registration was best carried out during the year under review, inasmuch as its recorded events rose to 1,378,610 from 983,400 in 1876, when a sudden and most marked advance was effected in comparison with preceding years since the scheme was inaugurated, *vide* marginal figures.

	Deaths.
1884	1,378,610
1876	983,400
1877	1,077,601
1878	1,064,116
1879	950,881
1880	922,633
1881	1,255,178
1882	1,349,651
1883	1,245,676

This very general improvement in registration is attributed in most of the local reports to special attention having been bestowed this year to the subject. This assertion is supported by the facts (1) that while there was no unusual *general epidemic* prevalence of sickness, the number of deaths recorded under *every* head of disease, was larger than those in the preceding year, or even during the preceding quinquennium 1879-83, small-pox excepted, *vide* figures in the margin; and (2) that this increase has been recorded against the fact, as gathered from some of the local reports, that many deaths were unreported owing to chowkidars having left their villages to seek a livelihood elsewhere, by other labour, in consequence of high prices of food-grains caused by deficient rainfall having injured the crops. As high prices for provisions obtained generally almost throughout the Province, the desertion of chowkidars may have been more general and registration suffered to a greater extent than reported.

Special measures adopted locally to improve Registration.

4. A brief resumé of some well meant endeavours to promote registration made by local officers during the year is subjoined.

Midnapore.—The measures taken in hand in the Midnapore town to improve registration by a full utilization of the Compulsory Registration Act, alluded to in the last Annual Report, continued in operation this year, and are said to be working satisfactorily. The Civil Surgeon personally lent assistance to the scheme by reporting every event he heard of, himself or through the Sanitary Inspector of the town. The result was an improvement in registration, as the recorded death-rate amounts to 31·22 per 1,000 of population, against 27·56 per 1,000 in the preceding year; but it should be mentioned that the cholera mortality was higher, 5·89 per 1,000 as against 1·46 per 1,000 in 1883. In the Ghattal Municipality the tax-collectors were made to render aid in the work of

registration with improved results. With regard to registration in the towns in the Sub-division of Ghattal, the sub-divisional officer notes :—" It can be confidently stated that the number of deaths shown to have occurred in each Municipality correctly represents the actual number of deaths in each, as the figures supplied by the registration agencies were generally found correct on enquiries held by the Vice-Chairmen of the several Municipalities." When, however, it is considered that the death-rates amounted in the Ramjibunpore town to only 11·18 per 1,000, in the Ghattal town to 18·75 per 1,000, and in the Chundrakona town to 18·68 per 1,000, and that, according to the Civil Surgeon, these towns are notoriously unhealthy, being situated in the malaria-stricken part of the district, it will be seen that much greater improvement in registration is called for, and that the statement of the Sub-divisional Officer is a rather hap-hazard one. In the rural circles of this district the *hath-chitti* or hand-book system, inaugurated last year, is said to have worked satisfactorily, and to have produced improved results. This statement is, however, not borne out by the death records, which show that 49,137 of these events were registered this year in these circles against 50,443 in the preceding year.

The *hath-chatti* system was also brought into operation in the districts named in the margin. The value of this scheme will be apparent from the advance in registration effected in these districts through its action (*vide* marginal figures), although these figures indicate no such advance as to render them representatives of even a rough approximation to the true death-rates of the districts, Rajshahye perhaps excepted. If this system were universally introduced and the register properly kept up, a natural consequence to be expected would be the prevention of the present great defect in death registration. Another advantage possessed by this register is that it contains only a few columns to be attended to by those who make the entries, so that elaboration being avoided, the chances of fictitious entries are reduced to a minimum. But the great drawback to the scheme is want of supervision, and without this perfect success is hopeless. In the North-Western Provinces and the Punjab this scheme is in operation with most excellent results, but the process is under the intelligent supervision of the district medical officers, and in the latter Province also under the vaccinating staff, even the vaccinators assisting during the non-working season. In Sarun, hitherto a very badly registered district, and where a really appreciable advance was attained this year, as shown in the above table, additional impetus to improvement was afforded through the keeping up at each station and out-post of a register separate from the ordinary one, for testing, by local enquiries in villages, the reports of deaths furnished by chowkidars. The great progress made in Noakholli was, in a great measure, due to the Magistrate, Mr. Borooah, having paid much attention to the subject during his visits to the thanahs and outposts.

	Ratio of Deaths per 1,000 of Population.		
	1884.	1883.	Increase in 1884.
Rajshahye	36·49	32·86	3·63
Rungpore	18·86	18·14	·72
Murshidabad	26·98	24·67	2·31
Sarun	21·91	15·33	6·58
Maldah	18·36	18·07	·29
Noakhalli	22·10	17·43	4·67

Bogra.—In this district the Civil Surgeon forwards to the District Superintendent of Police a quarterly statement, indicating shortcomings in registration, for the issue thereon of the necessary corrective orders.

Darjiling.—Act IV (B.C.) of 1873 (the Compulsory Registration Act) was extended from 1st May 1884 into the part of this district west of the Teesta river. The Deputy Commissioner, Mr. Oldham, issued, simultaneously with its introduction, a notification indicating the liability under its provisions of tea-planters and land owners to report all deaths occurring in their respective estates, and explaining to them the advantages to be derived by employing a chowkidar for the purpose. The result has been that all the tea-planters, who were not bound to report deaths before, do so now, and that the services of many chowkidars have been enlisted as reporters. Such of the planters who have not employed chowkidars, report the events personally to the officer in charge of the police-station of the circle in which their plantations are situated. The outcome of these measures has been an improvement in the death-rate of this notoriously badly registered district, as the rate at which deaths were registered during 1884 amounts to 12·80 per 1,000 of population, against 11·11 per 1,000 in

1883 and 7·20 per 1,000, the average of the quinquennium 1879-83. This advance is gratifying, considering that the scheme is a new one with which its manipulators and the people were unfamiliar; was in operation only during a part of the year; and is not applicable to the whole district—and proves convincingly that if the Compulsory Registration Law were extended to the whole district and worked efficiently, a close approximation to, if not the true death-rate of the district may soon be arrived at.

In the *Dacca* town the report of deaths by the people are compared with the registers of the deceased kept at the burial-ground, and those who omit to report the events are prosecuted.

In the *Mymensing* district the police-stations have been divided into beats, and a police constable placed in charge of each beat, within which he is required to enquire and report whether all deaths are regularly reported by the village chowkidars. This is a very commendable scheme.

In the *Patna* town steps have been taken, under a scheme devised by the District Superintendent of Police, to work the Compulsory Registration Act systematically and energetically through the people, the police and the Municipal Commissioners co-operating.

Gya.—Active measures were adopted to improve registration in this district, by causing the police, of all grades, to make constant enquiries in the interior as to whether deaths had been omitted to be reported, and to take steps for the punishment of the defaulting chowkidars. The District and Assistant Superintendents of Police, and Mr. Macpherson, the Sub-Divisional Officer of Nowada, also rendered similar aid in the matter. A good plan, calculated to afford a close check on registration, was also brought into operation in the Gya town. This consists, with regard to deaths, of employing a mohurer, under the supervision of the station police, to grant passes for the interment or cremation of all dead bodies, and of delivering these passes to the police at the burning ghâts and burial-grounds; and, with regard to births, of inducing the midwives to report all the events at which they attend. The effect of these measures will be seen from the marginally noted figures; but it will be observed that the registration of births in the Gya town has not made a sensible advance, and that contrasted with deaths a large omission of the events is indicated.

Deaths.	1884.	1883.
Gya district	26·79	21·14
Gya town	49·07	46·97
Births.		
Gya town	29·41	29·38

Shahabad.—The Sub-Divisional Officer of Sasseram is said to have paid particular attention to registration by ascertaining from the punchayets, whom he assembled for the purpose during his tours, the number of deaths that had occurred. He thinks that the police statistics may be considered fairly accurate.

Mozufferpore.—In the towns of Mozufferpore, Hajipore and Sitamurhee, the provisions of the Compulsory Registration Act were fully enforced, as it was found that neither the police nor the inhabitants of these towns were thoroughly acquainted with the requirements of this law.

Chumparun.—In the towns of Bettiah and Motihari mohurers were employed, and in the former town a peon in addition, to register the vital statistics. In the district the system inaugurated by Mr. Henry in 1882, *vide* page 6 of the Annual Report of that year, was continued with decided improvement as compared with the results of previous years, as the deaths registered in 1884 amounted to 31,643 against 25,638 in 1883, 23,934 in 1882, and 21,377 in 1881. But a record, which shows that the death-rate among the population is only 18·37 per 1,000, must still be very incomplete.

Monghyr.—Last year the registration in this district was most lamentably defective—in fact this district was the worst registered one in the Province. The Magistrate was, in consequence, communicated with on the point by this office, and the consequence has been that during the year under review the District Superintendent of Police and the Municipal authorities pushed on registration vigorously, with the result that a great improvement has been effected, the rate at which deaths were registered being 16·02 per 1,000 of population in opposition to 9·93 per 1,000 in 1883; but the result attained is yet very defective, for a death-rate of 16·02 per 1,000 of population cannot be accepted as a true return.

Bhagulpore.—The town of Bhagulpore has been divided into a number of registering circles and the constables are held responsible for reporting daily the deaths occurring in their respective beats. It is reported that owing to this arrangement "the registration in the town is always well done." This assertion would appear to be supported by the fact that the death-rate in 1884 was 49·17 against 34·16 per 1,000 in 1883.

Balasore.—In the Balasore town steps were taken to work the Compulsory Registration Act more vigorously than hitherto. For this purpose two Sub-Registrars were appointed to look after registration, and the Assistant Superintendent of Police was required to take "proper notice" of any constable who failed to report deaths within his beat as required by the provisions of that Act.

Measures adopted in this Office to improve Registration.

5. The following efforts to improve registration were made by this office during the year in addition to the action taken in the matter in former years, as detailed in the report of those years:—

(1.) In July a form, copy of which is subjoined, was issued to the Superintendents of Vaccination, with a request that all Deputy Superintendents, Inspectors, Head-vaccinators and other officers holding corresponding rank should use it in checking the registration of vital statistics in each village and thanah visited by them, and that a copy of the return should be furnished to this office. The defects found are then reported to Magistrates of districts:—

Name of Village গ্রামের নাম } Name of Thanah থানার নাম } Name of Chowkidar চৌকীদারের নাম

BIRTHS. জন্ম।					DEATHS. মৃত্যু				
Name of Reporter of birth. জন্মের সংবাদ দাতার নাম।	Sex of Child. স্ত্রী কি পুরুষ।	Class or Caste of Child. জাতি।	Month in which born. যে মাসে জন্ম হইয়াছে।	Entered or not in the Thanah Register. থানার রেজেষ্টরী বহীতে লেখা হইয়াছে কি না।	Name of Deceased. মৃত ব্যক্তির নাম।	Age of Deceased. মৃত ব্যক্তির বয়স।	Month in which died. যে মাসে মৃত্যু হইয়াছে।	Entered or not in the Thanah Register. থানার রেজেষ্টরী বহীতে লেখা হইয়াছে কি না।	REMARKS. মন্তব্য।

The object of this form is, it will be readily seen, to regulate and systemize the *modus operandi* adopted in checking and reporting the events, and to give the scheme a wider scope by extending its operation to the entire large area of country traversed by the vaccinating staff; for hitherto the performance of this work was entrusted only to Superintendents and Deputy Superintendents, and the reports were submitted in a prescribed diary which was unsuited for use by the inferior officers in the department. The result of this measure has been that hundreds of these verification statements were submitted, and numerous references made to Magistrates and other local officers, notifying to them that deaths which were ascertained to have occurred in villages had not been reported at the thanahs, and consequently had not been entered in the registers of these events kept up in them. There is reason to believe that this action has led, in many instances, to the rectification of the death records; to the punishment of chowkidars for neglect, and, I trust, to the local reporting and recording officers being more alert in the performance of their duties. I

entertain strong hopes that if this scheme is pursued systematically and persistently, it will have a powerful effect both in improving registration and preventing it retrograding.

(2.) A very close check over similar reports submitted by the Superintendents of Vaccination was also kept up this year, and omissions and remissness on their part censured, the effect being that a much larger number of such reports were received and acted upon, and that this procedure produced results similar to those mentioned above.

(3.) Finding that the municipal weekly records of births and deaths, published in the *Calcutta Gazette*, had some effect in promoting registration in several of the towns of which the records are published, I have solicited Government, in letter No. 7444, dated the 29th December 1884, to extend the scheme to the remainder of the towns in the Province, in the hope that a more extended promulgation of these statistics may lead to the rectification of errors in registration over a wider area.

(4.) As reported before, this office receives quarterly reports of prosecutions instituted and fines levied for evasions of the provisions of the Compulsory Registration Act IV (B.C.) of 1873, from all the towns in which this law is in operation. As in many cases these returns were submitted blank, and as in most instances the registration of births and deaths was found to be defective, the Chairmen of the Municipalities in question, were communicated with, the shortcomings pointed out, and a request made that the provisions of the law be fully utilized with a view to improvement in registration. This action has had, it will be seen from paragraph 10 of this Report, the effect of securing better attention to the subject.

Drawbacks to advance in Registration.

6. From a report received from the Joint-Magistrate of Bettiah in Chumparun, it appears that imperfection in the registration of deaths is traceable to the "omission of the chowkidars to exert themselves to collect statistics of deaths, partly by the withholding of information regarding deaths by the relatives of deceased persons, and partly by the taking of douceurs for the suppression of such information by chowkidars working upon the fears of the ignorant. It may be also that punchayets and chowkidars do not think it worth while to report the deaths of very old women and very young children." He adds that in the course of the census operations of 1881, he was actually asked by an enumerator whether it was meant that old women and young children should be enumerated. If this state of things is at all general, much defect in registration is a necessary consequence.

A few years ago, when Dinagepore was under an energetic District Superintendent of Police, it was the best registered district in the Province. Now it ranks low in the list indicating the value of registration in each district—and it is reported that owing to the attendance of the chowkidars being very irregular, registration has suffered.

In the beginning of 1885 the Government directed the abandonment of the use of the form devised by Mr. Carstairs for checking the registration of births and deaths, the adoption of which in all Municipalities and Unions was sanctioned in orders No. 239T—M, dated the 1st June 1882. This is to be much regretted, as this form, if generally used and regularly kept up, is calculated to improve and advance registration greatly. The advantages claimed for it are, (1) that the head of the family is responsible for keeping it up; (2) that it is a record indicating gain and loss (gain by births and loss by deaths), so that family interests are involved in keeping it up correctly; and (3) that it fixes with certainty the localities where infectious or epidemic diseases, or excessive mortality, may be prevailing.

Registration yet very defective.

7. Notwithstanding the local and departmental efforts made to advance registration as detailed above and in previous reports, the statistical information recorded in this the sixteenth year of the inauguration of the scheme is still very defective.

This is the more apparent from the fact that the registration in towns (taking the figures of the past seven years of which the results are more in advance than those of years preceding that period) has, in spite of the corrective machinery available in them for its improvement, reached the rate of only 23·51 per 1,000 of population for births, and 27·43 per 1,000 for deaths, *vide* figures in the margin. The large fluctuations in the mortuary figures will be found to be traceable to the effect of individual towns taking precedence in the production of high death-rates, due to the unusual fatality with which one or more diseases prevailed in them. One additional reason, and an important one, why the normal death-rate of the Province cannot be seen, is that a large number of the registering circles return altogether unreliable or impossible death-rates, which being component parts of the whole, vitiate the general rate.

	Ratio per 1,000 of population.	
	Births.	Deaths.
1878	19·56	35·13
1879	16·93	33·53
1880	23·44	26·86
1881	25·51	33·47
1882	22·49	31·05
1883	22·08	27·28
1884	23·51	27·43

Local suggestions for improving Registration.

8. Among the suggestions for improving registration made in the local reports the following deserve consideration:—

Dr. Mathew, the Civil Surgeon of Mozufferpore, suggests that the co-operation of the Indigo Planters, whose establishments are scattered all over the district, who hold a large number of villages in farm as ticcadars, who receive very accurate information regarding all that concerns the population of a considerable portion of Mozufferpore and the neighbouring districts, and from whom a trustworthy report regarding the general health of the district can, consequently, always be obtained, should be secured in solving the difficult question as to what the actual death-rate is among the population, and in checking the information relating to deaths submitted by the police.

The Deputy Commissioner of the Sonthal Pergunnahs very correctly observes:—"We have no means of checking death registration, and, until some simple but effectual means are devised, we cannot expect much better results than what we now get. I do not believe that police officers ever take the trouble to check chowkidars' reports, unless for special reasons in special cases. It entails taking the registers with them, or notes or extracts therefrom for comparison. Enquiries by constables are next to useless. The real fact is the police have no heart in it, and the chowkidars have no incentive. Create an interest in the subject, and better registration will follow."

Suggestions have been thrown out, with which I quite concur, that were a portion of the fines realized by prosecuting evaders of the provisions of the Compulsory Registration Act paid to those who bring to notice such evasions, better results in registration might be secured; but in order that appreciable results may be attained the law should be in force in every town in Bengal and its provisions fully utilized.

Suggestions for improving Registration by this Office.

9. But, year after year, suggestions have been made for placing registration on a satisfactory footing. Some of these cannot be adopted on financial grounds, some are incapable of general application, some the people are not sufficiently prepared to adopt, others are calculated to produce but partial or ephemeral benefit. There can, however, be no doubt, as I and my predecessors have often pointed out, that the machinery and organization under which the statistics are at present collected, recorded and supervised, having, after a very long trial, proved a failure in securing even approximately correct results, should give place to some other scheme, which will secure for registration an intelligent and reliable agency and systematic, continuous, and sustained supervision. Perhaps these ends may be realized through the instrumentality of the Union Committees to be established under the Local Self-Government Law just passed, as under that law they are bound to render assistance in birth and death registration. I should think that the hearty co-operation of these bodies (who must form the enlightened portion of the community, and be consequently capable of estimating good advice) may be looked for, if it is explained to them that the sole object and intention of Government in calling for vital statistics is the sanitary welfare

of the people whom they represent; that reliable statistics are necessary for ascertaining how much disease, especially of an infectious and epidemic character, is present among the people, and how severe is the penalty the people suffer by its presence; and that with this information the causes which aid and foster the prevalence of disease will be sought for, and measures to remove them, or ameliorate their incidence, or prevent their recurrence, taken.

From reports received it appears that the Police Department have objected in some towns to carry on registration, and it is a question whether the Municipality should undertake the work under the provisions of Part XI of the Bengal Municipal Act of 1884. I should be glad to see all Municipalities attend to registration in their towns. This would necessitate the entertainment of paid agency and personal supervision of the work by the Commissioners, but the gain would counterbalance the expense and trouble incurred. Under the existing system there is a great tendency on the part of the Municipality to throw the responsibility of efficiently carrying out the work on the Police, while the Police disclaim the responsibility, the consequence being that registration suffers. The full exercise of the powers vested in Government by Part XI of the abovementioned enactment is a desideratum.

Extension of the Compulsory Registration Act, IV (B.C.) of 1873.

10. This enactment was extended during the year under review to the Bansberiah and Naihatti Municipalities, the former in the Hughli and the latter in the 24-Pergunnahs district, and to that part of the Darjiling district which lies to the west of the river Teesta, so far as it provides for the registration of *deaths*, but not of *births*. The law is now in operation in 116 towns and one rural tract. In the following table are shown the towns in which prosecutions for breaches of its provisions were instituted and the results:—

Districts.	Towns.	Number prosecuted.	Number convicted.	Number acquitted.	Number struck off.	Number pending.	Amount of fines realized.	Birth-rate per 1,000 of Population.	Death-rate per 1,000 of Population.
							Rs. A. P.

	Total	396	316	47	9	24	240 2 6		

This table shows that, compared with the list of 1883, 396 against 297 persons were prosecuted in 42 against 25 towns, of whom 316, or 79 per cent. against 232, or 78 per cent., were convicted; that the fines realized amounted to Rs. 240-2-6; and that the result of the measure was an advance, to a more or less extent, in the registration of births in 18, and of deaths in 23 of the 42 towns in comparison with the figures of 1883. These facts indicate great improvement

in the administration of this law, and it is gratifying to find for the first time, from some of the reports, that the absence or paucity of prosecutions is due to the people spontaneously and regularly reporting the occurrence of births and deaths among them, and thus giving no occasion for the exercise of the clause of the law prescribing a penalty for evasions, and that, moreover, in some Municipalities special agency has been engaged to detect cases of non-compliance by the people with the requirements of the law. I attribute this advance to the closer attention given to the subject by this office in the manner mentioned in paragraph 5, clause 4, of this Report. Nevertheless, it is also apparent that much yet remains to be done before the working of this enactment can be said to be quite satisfactory.

Changes affecting Circles of Registration.

11. The following revisions affecting the Circles of Registration were effected during the year :—

Midnapore.—Village Kayaput was removed from the jurisdiction of thanah Gurbetta in Midnapore to that of thanah Goghat in Hughli, involving a decrease of 2,237 in the population in the former district and a corresponding increase in that of the latter. *Howrah.*—Balli, which hitherto formed a part of the Howrah Municipality, was constituted a separate Municipality with a population of 14,815. 24-*Pergunnahs.*—Outpost Goberdanga with its population of 6,464 was removed from the jurisdiction of thanah Baduria to that of thanah Habra, both in this district. *Murshidabad.*—Owing to interchange of villages the boundaries of thanahs Barna, Bharatpur and Gokurna have been altered with a redistribution of the population, the population of the first-named thanah being now 67,912, that of the second, 1,08,025, and that of the third, 42,446. *Rajshahye.*—A number of villages with their population of 2,273 were transferred from thanah Charghat to thanah Lalpore. *Rungpore.*—Similarly certain villages with their population of 6,336 were transferred from thanah Kumargunge to thanah Darwani. *Bogra.*—Certain portions of thanahs Bogra, Sherpur and Shariakandi were formed into a new independent outpost, named Dhunat, with a population of 61,003. *Dacca.*—The union of Manickgunge was abolished and incorporated with thanah Manickgunge, thus increasing the population of the latter by 11,289. *Poori.*—Villages Mahantsahi and Matiapara in thanah Poori were, with their population of 492, transferred to the town of Poori.

The above changes did not, however, affect, on the whole, the total population of the Province.

BIRTH STATISTICS.

Number born.

12. The number of births reported to have occurred in the 47 towns in which the events were recorded and their general results on population and mortality are submitted in the subjoined table :—

	1884.	1883.
Number of towns	47	46
Population	1,685,651	1,686,159
Number born	39,640	37,215
Birth-rate per 1,000 of population	23·51	22·08
Deaths	50,349	50,487
Death-rate per 1,000 of population	29·86	29·95
Excess of deaths over births	6·35	7·87
Number born dead (not included above)	1,437	1,437

Beyond the fact that the birth-rate had increased by 1·43 per 1,000 of population, the above figures forbid any further conclusion of intelligible consequence, the record being lamentably faulty.

13. *Towns which returned the highest proportions of Births.*

	1884.	1883.
Jamalpore (in Monghyr) ...	49 39	49 17
Kendrapara ...	46 91	25 54
Brahmanberia ...	37 45	33·46
Bettiah	35 17	30·47
Jamalpore (in Mymensing)	34 49	34·24
Bhagulpore	33 88	33 64
Bankura	33 65	34 93
Revilgunge	32 41	37 30
Serampore	31·02	26 79
Durbhanga	29 57	24 32
Gya	29 41	29 38

The above results may be considered as approximating the truth in a more or less degree, and afford a lesson to the rest of the towns as to what can be effected by care and attention to the subject.

14. *Towns which recorded Births in excess of Deaths.*

	Rate of excess per 1,000 of population
Kendrapara . ..	21 81
Jamalpore (in Monghyr)	16 51
Brahmenberia ...	15 05
Bettiah	11 81
Patna	8·61
Comillah	8 22
Durbhanga	5 58
Sitamurhi ...	4 40
Revilgunge	3 36
Bishenpore	2 96
Bankura .. .:.	2·94
Jamalpore (in Mymensing) ...	2 69
Futwa	2 58
Purulia ...	1 62
Utterpara	1 45

This is a very incomplete list, as only 15 out of the 47 towns occupy places in it. Unless there exists some special circumstances accounting for the defect, there ought to be a preponderance of births over deaths in every town.

15. *Births according to Sex.*

Of the sexes born 21,331 were boys and 18,309 girls, yielding the proportions to population of 12·65 and 10·86 per mille respectively, and the percentage of male to female births of 116. The corresponding figures of the preceding year are male births 11 79 per 1,000, female births 10·29 per 1,000, and male to female births 114 per cent. The results of the year under review vary very little from these figures numerically, but, as usual, there was a preponderance of male births, accounted for by causes explained in former reports.

16 *Births according to Class or Nationality.*

	In 1884.		In 1883.	
	Number of births	Ratio per mille	Number of births	Ratio per mille
Christians ..	105	22 95	376	21 31
Hindus ...	27,638	23 28	25,818	21 75
Mahomedans .	11,487	21 18	10,970	23 10
Budhists	31	14 65	2	94
Other races ..	79	19 78	49	12 27

The figures of 1884 present the same features as those of the preceding year, viz, that in accession to population by births, the Mahomedans rank first, the Hindus second, and the Christians third—the other nationalities being eliminated.

Births among Non-Asiatics and Mixed Races.

17. Among these classes the births of 645 children were recorded, of whom 336 were boys and 309 girls.

DEATH STATISTICS.

Population and Area under Registration.

18. The mortuary events of the year under review, the details regarding which are hereinafter discussed, occurred in 652 (96 urban and 556 rural) main circles in which death-rolls are kept up, and among a population numbering 66,163,884, distributed into sex and nationality as follows :—

	Urban.	Rural.	Province
Population according to Sex.			
Males	1,277,520	31,554,696	32,832,216
Females	1,180,846	32,150,822	33,331,668
Total ..	2,458,366	63,705,518	66,163,884
Population according to Class.			
Christians	22,222	79,662	101,884
Hindus	1,744,365	41,208 664	42,953,029
Muhomedans	684,323	20,677,634	21,361,957
Budhists	2,173	77,548	79,721
Other classes	5,278	1,662,015	1,667,293

19. Of the above population 1,378,610 were reported to have died during the year under review, at the rate per mille and in the areas exhibited in the subjoined table:—

Number and Proportion of Deaths.

	In 1884.		In 1883.	
	Deaths.	Ratio per mille.	Deaths.	Ratio per mille.
Urban	67,443	27·43	67,383	27·28
Rural	1,311,167	20·58	1,178,293	18·49
Province	1,378,610	20·83	1,245,676	18·82

These figures indicate that, in comparison with the preceding year, the mortality was higher by 2·01 per 1,000 of population; but it is seen that this increment is almost entirely limited to the *rural* circles. This points to growing interest in the subject in these circles rather than to higher suffering among the people.

20. The aggregate death-rate of the year was distributed as follows over the specific diseases which caused the casualties. The figures do not include the still-born children numbering 20,015:—

Mortality from Specific Death Causes.

	Proportion of Deaths per 1,000 of Population.								
	In 1884.			In 1883.			In 1879-83.		
	Urban.	Rural.	Province.	Urban.	Rural.	Province.	Urban.	Rural.	Province.
Cholera	3·81	1·96	2·03	3·64	1·27	1·36	3·47	1·52	1·59
Small-pox	1·10	·24	·28	27	·14	·14	·65	·27	·28
Fevers	12·80	14·66	14·60	13·77	13·81	13·81	15·50	12·26	12·38
Bowel-copmlaints	3·24	·79	·88	3·54	·73	·83	3·89	70	·82
Injury	·44	·36	·37	·40	·35	·35	·42	·38	·33
Other causes	5·01	2·54	2·66	5·64	2·18	2·30	5·79	1·73	1·89
All causes	27·43	20·58	20·83	27·28	18·49	18·82	29·72	16·82	17·30

Faulty as these figures are, they present the following noteworthy facts in connection with the returns of both the periods (1883 and 1879-83) with which comparison is instituted.

(1.) That the aggregate increase in the mortality of the year was distributed over *every* specified head of disease.

(2.) That eliminating bowel-complaints and injury, the enhanced fatal results from which exhibit only fractional variations, and small-pox, the mortality from which maintained the same ratio, the integral portion of the increment was contributed by cholera, fever and the maladies classed under the head of "other causes," fever taking the lead, *vide* marginal figures.

	Increase per mille as compared with	
	1883.	1879-83.
Fever	·79	2·22
Cholera	·67	·44
Other causes	·36	·77

(3.) That looking to these figures again, it is seen that the enhanced mortality from none of these diseases exhibits emphasized excess, excepting from fever in comparison with the results of the quinquennium 1879-83.

(4.) That while in the *urban* circles fever and bowel-complaints which prevail universally, and the first of which causes, relatively, the greatest loss, exhibited abated mortality, in the *rural* circles these diseases as well as *all the rest* displayed enhanced fatal results.

The significant deduction to be drawn from the abovementioned facts is that, local disturbances excepted, the year under review was not, on the whole, characterized by the prevalence of any disease in a form (in comparison with its incidence during preceding years), the severity of which attracts special notice; and that, where registration has been improved, the opinion is growing that the rural circles, characterized by the existence in them of unchecked morbific influences stimulated by primitive filthiness of habits of the people, &c., are unhealthier than the urban circles in which corrective precautions are observed. With regard to the latter observation, the remarks of Dr. Russell, the Civil Surgeon of Nuddea, regarding the relative health status of the urban and rural areas in that district claim attention. He bases his views on the results of the mortuary statistics influenced more largely by fever and cholera than in other districts, and on information gathered from other sources. He says that, if 35 per mille is to be accepted as the average rural death-rate in Bengal, the rural rates

in Nuddea will be found to be abnormally high, but not excessively so. This being the case, the mortality in the towns, when found to be considerably lower than in the rural areas for a series of years, leaves no other inference than that the health of the towns is gradually improving, for registration can scarcely be considered to have influenced this improvement, as it is beyond doubt that better care in this matter is taken in the urban than in the rural areas, although the incidence of the prevalent fever in Nuddea has caused the registering agency to be more diligent in both areas. This improvement in the towns is referred to the sanitary improvements effected in the urban circles, which have left their mark on the health of these areas, and is steadily lowering their death-rate. It seems to the Civil Surgeon that "sanitary improvement, even in the elementary and imperfect stage which it has as yet reached in many of these towns, has yet exerted a well marked influence in stamping out an abnormally high death-rate;" while, "on the other hand, the rural areas, i.e., those still untouched by sanitary works, are showing no signs of improved health or of decline in their high death-rates." He adds that "this contrast between the rural and the urban death-rates is the more remarkable, in that it completely belies the statistical maxim that rural areas should have a lower death-rate than urban ones, *i.e.*, have better health."

	Ratio of death per mille			
	1884	1883	1882	1881
Towns combined	26 84	31 40	35 8	37 21
Rural circles combined	40 57	36 41	40 52	41 94

21. **Mortality in Bengal, Behar, Orissa and Chota Nagpore.**

	In 1884					In 1879-83				
	Cholera	Small-pox	Fevers	Bowel-complaints	All Causes	Cholera	Small-pox	Fevers	Bowel-complaints	All Causes
Bengal	2 71	05	16 67	47	22 82	1 1	17	14 10	61	18 71
Behar	[illegible]	76	13	77	18 24	1 66	23	10 [illegible]	47	1[illegible] 1
Orissa	4 95	10	7 31	3 21	23 61	2 87	1 14	7 10	2 70	18 13
Chota Nagpore	[illegible]	26	12 34	1 18	16 10	73	25	10 8[illegible]	1 13	14 81

The figures in this table disclose that, relatively considered, cholera and bowel-complaints caused greatest loss of life in Orissa, small-pox in Behar, and fever in Bengal; and that, in comparison with the average mortality during the quinquennium 1879-83, cholera was more fatal in Bengal, Orissa and Chota Nagpore, and less so in Behar; small-pox exhibited greater activity in Behar than in the other three divisions; fever prevailed with enhanced severity in all the four divisions, and bowel-complaints caused more loss of life in Bengal, Orissa and Chota Nagpore, but maintained an equal death-rate in Behar—the culminating result being that in mortality from all causes, the four divisions exhibited higher mortality.

22. *Seasonal incidence of the Diseases.*

Months	Deaths in 1884	Months	Deaths in 1879-83
November	151,886	December	129,829
December ..	145,089	November ..	123,282
April	132,729	October .	101,779
October .	115,823	January .	98,167
May	115,777	April ...	92,111
January ..	113,000	August .	91,508
August	107,875	September ..	88,454
March . .	107,819	May	87,684
September ...	100,532	July ..	87,285
June .	98,258	March ..	84,749
July	95,802	June ...	81,195
February	94,020	February	78,921

It is again seen that, in consonance with the law of former years, the fourth quarter is the most fatal to life in the Province. It is during this period that fever and bowel-complaints are most active. April and May were also unhealthy months, due to cholera and small-pox having presented the largest number of deaths during these months.

23. The next table shows that of the sexes 119 males died to every 100 females, against 118 in 1883 and 122 during the lustrum 1879-83, indicating again defect in the relative proportions, which ought to approximate more closely, the propor-

Mortality according to Sex

tionate numbers living being, according to the Census of 1881, 99 males to every 100 females :—

	In 1884.			In 1883.			In 1870-83		
	Deaths.	Ratio per mille.	Proportion per cent. of male to female deaths	Deaths	Ratio per mille	Proportion per cent. of male to female deaths	Deaths	Ratio per mille	Proportion per cent. of male to female deaths
Males	7 [illegible] 113	22 81	11[illegible]	6 7[illegible] 175	20 [illegible]	118	6 31 [illegible]	19 22	122
Females	[illegible] 2[illegible] 1[illegible]7	18 88		5 [illegible] 501	17 [illegible]		[illegible]	1[illegible] 41	

21. *Mortality according to Age.*

	In 1884				In 1883			
	Ratio per mille			Proportion per cent. of male to female deaths	Ratio per mille			Proportion per cent. of male to female deaths
	Urban	Rural	Province		Urban	Rural	Province	
Under 1 year	1[illegible]6 [illegible]4	111 87	11[illegible] [illegible]0	1[illegible]1	178 70	9[illegible] 18	[illegible]	1[illegible]2

50 to 60 "	30 1[illegible]	[illegible] 8[illegible]	[illegible] [illegible]3	118	[illegible]1 [illegible]7	[illegible] 1	[illegible] 43	117
60 years and upwards	52 43	[illegible]	48 74	98	6[illegible] 85	41 [illegible]0	[illegible]	97

The only salient features manifested by these figures are considerable improvement in the record of infantile mortality and some advance towards a more reliable death-rate of the aged. In the subjoined table are exhibited the districts in which deaths of infants, children and old persons were recorded in the highest proportions. The record, although better than the one for last year, is yet very defective :—

Under 1 year		1 to 5 years		50 to 60 years		60 years and upwards	
Poori ...	330	Nuddea ...	49	Rajshahye ...	44	Backergunge	77

						Bankura	52
						Tipperah	51

Deaths according to Class or Nationality

25. Under this head the distribution of the mortality stands as follows :—

	Ratio per 1,000 of Population.								
	In 1884			In 1883			In 1870-83		
	Urban.	Rural	Province.	Urban	Rural	Province	Urban.	Rural	Province
Christians	20 88	11 58	13 61	22 68	9 70	12 52	22 13	[illegible]8	12 16
Hindus	27 41	19 96	20 26	27 76	18 05	18 45	30 10	1[illegible] 73	17 27
Mahomedans	27 80	22 30	22 48	26 39	19 70	1[illegible] 91	23 09	17 02	17 4[illegible]
Budhists	31 68	13 29	13 79	16 06	11 74	11 84	19 00	[illegible] 23	[illegible]7
Other races	13 07	15 22	15 21	11 74	15 22	15 [illegible]1	23 [illegible]	16 03	1[illegible] 01

Of the three principal nationalities, the Mahomedans appear to have suffered the most, the Hindus in the next degree, and the Christians the least. The events as they occurred in the preceding periods with which comparison is made present similar features, except that the mortality among the Mahomedans does not exhibit, as contrasted with that among the Hindus, the large excess seen during the year under review.

Deaths among Non-Asiatics and Mixed Races.

26. Among these classes 679 deaths occurred, distributed into 460 males and 219 females, and caused by cholera 94, small-pox 5, fever 101, bowel-complaints 61, injury 52, and other causes 366.

27. *Births and Deaths in Calcutta in 1884 compared with the same events in the Bengal towns.*

	Births.		Mortality.							
			Ratio per 1,000 of population.							
	Ratio per 1,000 of population.	Proportion per cent of male to female Births.	All Causes.	Cholera.	Small-pox.	Fever.	Bowel-complaints.	Injury.	Other causes.	Proportion per cent of male to female Deaths.
Calcutta	19 13	108	30 59	5 24	1 10	8 35	2 70	·47	12 63	149
Bengal towns ..	23 51	110	27 43	3 81	1 10	12 89	3 24	·44	5 91	138

The figures indicate that in birth registration the Bengal towns excel Calcutta, excepting the defect seen in the record of girls born The excessive male population of Calcutta must not, however, be forgotten as a factor seriously influencing the birth-rate. Referring to the return of deaths, it will be seen that cholera was much more severe in Calcutta than in the Bengal towns generally; small-pox on an equal footing; fever and bowel-complaints less destructive; injury much the same; while other causes were more than double. The smaller death-rate from fever and increased rate from "other causes" may most likely be explained by more correct diagnosis of disease in Calcutta.

28. *Mortality of Natives in the 11* Cantonments in Bengal.*

		1884.	1883.
Population		33,346	33,991
	Deaths in 1884.	Ratio per mille. In 1884.	Ratio per mille. In 1883.
All Causes	812	21 35	21·50
Cholera	39	1 17	1·85
Small-pox	25	·71	14
Fever	419	12 56	11·38
Bowel-complaints	97	2 90	1 67
Injury	20	59	·47
Other causes	212	6·35	5·97

In comparison with 1883 the mortality from every death cause, excepting cholera, was higher, particularly from fever and bowel-complaints. The casualty-rates in each of the Cantonments are shown below, ranged in the order of severity with which diseases prevailed in them:—

	Ratio per mille.		Ratio per mille.
Hazaribagh	129 41	Dinapore	24 65
Darjiling	39·56	Fort William	18·20
Alipore	33·16	Buxar	14·06
Barrackpore	30 04	Dum Dum	12·99
Cuttack	29 33	Segowli	10 59
Dorunda	28 13		

The highest mortality again occurred in the Hazaribagh Cantonment. This Cantonment has been subject to this high rate of suffering for the past three years consecutively.

* Troops were not located in the Cantonments of Hazaribagh from April to December, Alipore in August and September, and Segowli in November and December.

Port of Calcutta—*Sickness and Mortality in*—

Among European Seamen.

29. The subjoined table shows, at one view, the sickness and mortality which prevailed among the *European seamen* in the Port of Calcutta during the year under review.

1	2	3	4	5					
				In 1884					
								Ratio of deaths per 1,000 of population	
Sickness	Population as per Census of 1881	Population as per estimate of the Health Officer	Number who visited the Port	Admissions into hospital	Deaths.	Ratio per cent of deaths to treated.	Ratio of deaths per 1,000 of the number who visited port	As shown in column 2	As shown in column 3
In Hospital									
Cholera ...	2,731	1,684 in 1884. 1,960 in 1883.	21,182	67	36	5.73	1.69	[illegible]	21.37
Diarrhœa				125	3	2.40	.14	1.07	1.78
Dysentery				80	2	2.50	.09	.71	1.18
Fever, enteric				7	5	71.42	.23	1.79	2.96
„ malarious				158	2	1.26	.09	.71	1.18
„ simple				297					
Scurvy				24	1	4.16	.04	.35	.59
Small pox				7					
Sunstroke or heat apoplexy				13	1	7.69	.04	.35	.59
Other diseases				1,248	26	2.08	1.22	9.51	15.43
Total				2,026	76	3.75	3.58	27.83	45.13
Out of Hospital									
Cholera					1		.04	.37	.59
Sunstroke or heat apoplexy					3		.09	.71	1.18
Congestive fever					1		.04	.37	.59
Drowned in Port					21		.99	7	12.47
Other diseases					6		.28	2.14	3.56
Total					31		1.46	11.10	18.40
Grand Total				2,026	107	3.75	5.05	39.33	63.53

The following facts are deducible from the figures in the above table in comparison with those of the preceding year.

Of 21,182 European seamen who entered Port, 2,026 resorted to hospital suffering from the diseases named in the margin. Compared with the return of the preceding year, it is seen that while there was an increase of admissions to hospital for cholera, simple fever, scurvy, small-pox, sunstroke and the maladies classed under the head of "other diseases," there was a fall in the numbers from malarious fever, dysentery and diarrhœa—diseases which always figure largely on the sick list. There were also seven cases of enteric fever against none in the preceding year.

	Number of Admissions In 1884	In 1883
Cholera ...	67	65
Diarrhœa	125	164
Dysentery	80	90
Fever, enteric	7	
„ malarious	158	323
„ simple	297	114
Scurvy ..	24	11
Small pox	7	5
Sunstroke or heat apoplexy	13	4
Other diseases ..	1,248	1,169
Total	2,026	1,948

Marginally are shown the casualties which occurred among the number stated above to have been admitted to hospital, and the proportionate mortality caused by each disease among the European Port population as estimated by the Health Officer. This record shows that the death-rate among the number who entered hospital was 45·13 per 1,000 of population, that there was a considerable rise, represented by 1·48 per mille of population in the mortality from cholera, against a diminution in the death-rates from dysentery, malarious fever, sunstroke and the maladies designated "other diseases;" and that while diarrhœa, enteric fever, and scurvy caused no casualties in 1883, they carried off this year 1·78, 2·96 and ·59 per 1,000 of the population respectively.

	Population.	Deaths	Ratio per mille 1884	1883
Cholera	1,684	36	21.37	19.89
Diarrhœa		3	1.78	.
Dysentery		2	1.18	2.15
Fever, enteric		5	2.96	
„ malarious ..		2	1.18	2.15
„ simple				
Scurvy		1	.59	.
Small pox		..	.	
Sunstroke or heat apoplexy		1	.59	1.61
Other diseases . ..		26	15.43	17.74
Total		76	45.13	43.54

In addition to the above mortality, 31 deaths occurred *out of hospital* from causes named in the margin, thus raising the total death-rate to 63·53 per 1,000 of population, or excluding 21 casualties from accidental drowning, which the Health Officer does not take to account in estimating the loss of the year, to 51·06 per mille.

Causes.	Number of deaths.
Cholera	1
Sunstroke or heat apoplexy	2
Congestive fever ..	1
Drowned in Port ...	21
Other diseases	6

The death-rate of the year, contrasted with those of the three preceding years, stands as noted in the margin. These figures indicate that, on the whole, the health of the European seamen in Port was better than in 1881 and 1882, but not so in comparison with 1883.

	Deaths			Ratio per mille		
	In hospital	Out of hospital.	Total	In hospital	Out of hospital	Total
1884	76	31	107	45·13	18·40	63·53
1883 .	81	10	91	43·51	5·37	48·92
1882 ..	94	6	100	52·45	3·35	55·80
1881 ...	65	7	72	48·11	5·18	53·33

30. Thirty-seven deaths occurred at sea among the European seamen, against 51 in the preceding year. Excluding 12, of which the causes have not been mentioned, the rest of the casualties occurred from fever 1, heat apoplexy 2, heart diseases 4, drowning 13 and other accidents 5. The fever death occurred on board a vessel from Rio Janiero where yellow fever was prevalent during the vessel's stay in that port, and as the death occurred within a week of her departure, it is believed that it was caused by yellow fever.

Deaths during Voyage.

31. The sickness and mortality among the *Native Floating Population* are exhibited in the following table:—

Among Native Floating Population.

Sickness	Native Floating Population at the Census of 1881	Number who visited the Port	In 1884 — Total deaths among Native Floating Population	Ratio of deaths per 1,000 of population	Number of Native Floating Population who were treated in hospital	Deaths among this number	Ratio per cent of deaths to treated
Cholera	25,409	9,172	138	5·43	95	38	40·00
Diarrhœa					4		
Dysentery			2	·07	5	1	20·00
Fever, malarious			5	·19	30		
" simple			10	·39			
Small-pox			5	·19	9	4	44·44
Scurvy							
Sunstroke or heat apoplexy					1		
Other diseases			37	1·46	157	19	12·10
Total			197	7·75	301	62	20·59

This record shows that 301 of the Native Floating Population, estimated at 25,409 at the census of 1881, resorted to hospital to receive treatment for the diseases named in the margin, and that of this number 62 died; that in addition 135 of this population died on boats (from the diseases also indicated marginally), thus raising the total number of the casualties of the year to 197, which yields a death-rate of 7·75 per 1,000 of population; that of the diseases which afflicted this population, cholera was the most fatal, the deaths from it amounting to no less than 70·05 per cent. of the total loss of the year; and that with regard to the other diseases, bowel-complaints and fever prevailed with mitigated severity, while small-pox and the diseases classed under the head of "other causes" exhibited higher mortality, the former to a slight and the latter to a considerable extent.

	Admissions to hospital.	Deaths in hospital	Deaths on boats.	Total.	Ratio per mille In 1884.	Ratio per mille In 1883.
Cholera	95	38	100	138	5·43	4·56
Diarrhœa	4		..		..	·07
Dysentery	5	1	1	2	·07	·47
Fever, malarious	30	...	5	5	·19	·31
" simple		.	10	10	·39	·55
Small pox	9	4	1	5	·19	·07
Scurvy		.	.	..		..
Sunstroke or heat apoplexy ..	1		...	..	..	
Other diseases	157	19	18	37	1·45	·94
Total .	301	62	135	197	7·75	7·00

	Deaths.	Ratio of deaths from cholera.	Total ratio per mille.
1884	197	5·43	7·75
1883	178	4·56	7·00
1882	186	4·52	7·32
1881	141	2·75	6·54

From the marginal figures it will be seen that, on the whole, the health of the Native Floating Population was worse than during three preceding years, cholera taking a predominating part in causing this unhealthiness.

Health and treatment of Lascar crews who proceeded on foreign voyages.

32. The average number of native seamen who left the Port this year on foreign and coasting vessels, and the mortality recorded in the official logs as having occurred among them at sea, are exhibited below:—

		Average strength.	Deaths.	Ratio per mille on average strength.
On Coasting voyages	... ...	3,417	5	1·45
On Foreign vessels ...	Steamers	5,046	22	3·84
	Sailing	679		
	Total	9,172	27	2·94

against 15 deaths among 4,783 men, or at the rate of 3·13 per mille in the preceding year. Enquiry into the manner in which the lascars were treated elicited five complaints with regard to diet. In three of these cases compensation was granted, in one the complaint was found to have been unfounded, and with regard to the fifth, stating that limejuice and mustard oil had not been issued, it was ascertained that these articles had been struck out of the scale by the agents of the vessel before the men left Port. With reference to this case, the Health Officer observes that arbitrary interferences of this description, with the authorized allowances to native crews, will be prevented in future by the Government Notification of the 8th August 1884 (since amended by Notification dated 6th June 1885), indicating the minimum scale of provisions to be provided for lascars in accordance with the provisions of section 25 of the Indian Merchant Shipping Act V of 1883.

GENERAL HEALTH OF THE PROVINCE.

Nuddea.	Murshidabad.
Rajshahye.	Bogra.
Pubna.	Khulna.
Balasore.	Cuttack.
Jessore.	Faridpore.

33. The districts which were markedly unhealthy during the year are those named in the margin, arranged in the order of insalubrity, and the causes of impairment of health were excessively fatal prevalence of cholera in all of them, and, in addition, of fever in Nuddea, Rajshahye, Pubna, Jessore and Bogra. Backergunge and Gya also rank high on the casualty roll, but the local authorities of these districts are decidedly of opinion that this is due to improvement in registration. This observation also applies to several other districts in which the mortality, although not very high, was still greater than during the preceding year, and the local opinion is that they enjoyed good or fair health. The Shahabad, Mozufferpore and Durbhanga districts are stated to have been healthier than during several past years. It is thus apparent that, on the whole, the health status of the Province had not deteriorated, whatever may be the standard of healthiness or unhealthiness normal to it, which, it is to be regretted, has not yet been statistically determined. That this should have occurred in a year of high prices for food-grains, particularly rice (*vide* marginal table), owing to the harvest having failed generally from deficient, early cessation, unseasonable, capricious distribution, or, in a few cases, excessive rainfall, is worthy of note. But the opinion, largely shared, is, that the prejudicial effects of a diminished food-supply with high prices were more than counterbalanced by a comparatively drier season proving beneficial to health. The exceptions to the observations with regard to the food outturn of the year are that the harvest was above average in Midnapore, Khulna and Sonthal Pergunnahs, and good in Chittagong, Dacca, Dinagepore, Balasore, Lohardugga, Noakhalli, Hughli and Singbhum. It should, however, be noted that in *Chittagong* the *aman* crop was damaged to the extent of 4 annas in thanahs Mirsera

	Price per maund in 1884.	Average prices of the three preceding years.	Difference in 1884.	Price per maund in 1883.	Rainfall. In 1884.	Rainfall. Average of preceding years.
	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	Inches.	Inches.
Common rice ...	2 8 1	1 10 6	0 13 7*I*	1 15 1	57·56	64·70
Pulses	2 6 11	2 3 11	0 3 0*I*	2 6 6		
Wheat	4 0 9	4 6 7	0 5 10*D*	4 2 6		
Fish	7 7 8	7 2 4	0 5 4*I*	7 9 0		

and Kumeria and outpost Jhalda, by a cyclone which occurred on the 1st of November; in the Naraingunge and Sudder sub-divisions in *Dacca*, and in the Palamow sub-division in *Lohardugga*, the outturn was below average; in some parts of *Dinagepore* the crops were damaged; and in the sub-division of Bhadrak, in *Bulasore*, there occurred a partial failure. The detailed statement, of which the table furnished above is an abstract, shows that the price for rice was higher in *every* district during the whole or greater portion of the year, and that for pulses in 31 of the 45 districts. These, it will be recollected, are staple articles of diet of the people. But the drought, although it did not prejudically affect public health generally, will influence the health status of the localities affected for some time to come. In *Burdwan*, the present was the third year of inadequate harvest and the worst, as there was "next to no paddy to be cut or husked." In thanahs Bood-Bood, Shahebgunge, Montessur, Purbusthali and Mungulkote, and in some parts of thanahs Satgachi, Kulna, Cutwa, Katugram and Kaksa, great distress prevailed, especially among the labouring classes. The Magistrate, in visiting some of the affected tracts observed that many of the beggar class, the sick-poor, and the wives and children of men who were forced to leave their homes in search of work, were sadly pinched for food. Relief was administered to the sufferers, and special agencies for the distribution of charitable relief were started and continued during the last six months of the year. In this work Assistant Surgeon Jogobundhoo Gupta of Mankar and Assistant Surgeon Sasi Bhusan Mukerjee displayed great energy, care and economy. On the whole, however, beyond the want of food causing emaciation, "the general health of the people has not been very materially affected, and there has been no perceptible outbreak of any disease among the sufferers." In *Bankura* there is defective food-supply particularly among the labouring and cultivating classes, especially in the tracts along the banks of the river Damuda, where the crops failed totally. But the general health is stated not to have been yet affected. In *Birbhum* there was much distress among the same classes. To meet their wants charitable relief works were started in October and kept up until the winter harvesting had begun. Road cess works were also undertaken. The Magistrate of *Pubna* states that the deficiency of food was most marked in the north of the district, but was nowhere so accentuated as to cause any real distress; but the Civil Surgeon is of opinion that this deficiency had a disastrous effect in September on fever-stricken and weakly persons, and that defective nourishment and cold produced and kept up the complications of malarious fever, as evidenced by half of the dispensary patients and a large number of the jail admissions having splenic enlargement and malarious cachexy. In *Julpaiguri* it is suspected that sickness, especially of a malarious type, was partially due to high prices compelling the people to limit the quantity of their food, which lessened their power to resist the encroachment of disease. The report from *Gya* shows that anxiety is felt in only the Nawada sub-division, where a two-anna crop is expected, and in some parts of which the rice fields are as bare as a road. It is very sad to state that there occurred in this sub-division 38 cases of deaths of beggars, attributed solely to want of food. The health of the people generally was, however, good. In *Durbhanga* the high prices for food is seriously felt in several parts, particularly in the eastern portion of the sudder sub-division. Alna and soothni (root fruits), which form a subsidiary food in ordinary seasons, were resorted to as staple food during the drought, and thereby the people have tided over the difficulty. Relief works were in consequence started, and Government sanctioned a grant of Rs. 5,000 for the purpose. The general health of the people has not, however, yet been noticeably affected, but it is feared that, owing to a continuation of the drought and to deficient water-supply the tanks in the towns and several other localities in the district having run dry, sickness will be very widespread in 1885. In *Mozufferpore* the poorer classes suffered more or less, but serious consequences were averted by two falls of rain, one at the beginning and the other at the end of October. In *Monghyr* also the same cause, added to good distribution of rainfall, was "the saving of the district." In *Bhagulpore*, while the rich were pinched for food, the poor had to depend on inferior grain, such as *shama*, *cheena*, &c., &c. The distress which was felt in the Palamow sub-division, in *Lohardugga*, was staved off by a good *mahua* crop. In *Manbhum* had not the autumn (*bhadoi*) crop, especially Indian corn, produced fortunately an ample outturn, there might have been serious distress among the poorer classes.

SECTION VI.

HISTORY OF THE CHIEF DISEASES.

CHOLERA.

Extent of prevalence and fatality of Cholera.

34. During the year under review 134,421 persons, or at the rate of 2·03 per 1,000 of the registered population, were reported to have fallen victims to Cholera, as opposed to 90,439, or at 1·36 per 1,000, during the preceding year, and to 105,595, or at 1·59 per 1,000, during the lustrum 1879-83. It was, as usual, present in every district, and pervaded 24,621 villages against 16,316 in 1883, prevailing epidemically in 90 of the registering circles against 47, and with conspicuous severity in 90 against 64; while 432 against 491 circles enjoyed much immunity, and 37 against 46 were entirely free from the pest. These figures indicate that the disease was considerably more diffused and fatal than during the preceding year.

Comparative mortality from Cholera in Urban and Rural Areas.

35. The table in the margin shows the distribution of the casualties from Cholera between the Urban and Rural circles of the Province. The enhanced fatal results from the disease were, it will be seen, participated by both the urban and rural circles, but to a greater extent by the latter.

	In 1884.		In 1883.	
	Deaths.	Ratio per *mille.*	Deaths.	Ratio per *mille.*
Urban circles	9,390	3·81	8,993	3·64
Rural „	125,031	1·96	81,446	1·27

Districts which suffered most from Cholera.

36. Of the 45 districts, only 11 returned lower mortality from Cholera in comparison with the suffering of the preceding year; and the districts in which the disease proved most markedly fatal to life are the following 12, which exhibit death-rates ranging from 3·36 to 7·79 per 1,000 of population:—

Districts.	Ratio per *mille.*	Excess or deficit, as compared with 1883.	Districts.	Ratio per *mille.*	Excess or deficit as compared with 1883.

Seasonal influence of Cholera in the entire Province.

37. The figures elucidating the seasonal fatality of Cholera in the entire Province are given in the margin in connection with the figures of the quinquennium 1879-83 and the rainfall in 1884. These figures again forcibly illustrate the influence of rainfall on Cholera prevalence. After the continued drought of October to December 1883 and January and February 1884, during which months the rainfall amounted to only ·99, ·12, 1·36, ·05 and ·79 inches respectively, there occurred a sudden and very marked rise in Cholera mortality in March, which prevailed with abiding severity during the two following months—April, with 2·63 inches of rain, exhibiting maximum amount of suffering. In May there fell 6·06 inches of rain and in June 12·04 inches, and in the latter month the fatality of the disease abated very considerably and the decline was progressive up to October. During June to October the rainfall was heaviest, amounting to 46·63 inches out of 57·56 inches, the aggregate fall of the year. November and December were months of very diminished rainfall, which amounted to only ·57 inches for both months, and during this period the disease displayed considerably enhanced fatality. There was, however, a peculiarity observable in the behaviour of the disease, viz. that while in 1883 November and December, with 1·48 inches of rain, were in

Months.	Deaths in 1884.	Months.	Deaths in 1879-83.	Rainfall in 1884.

January ...	4,633	February ...	4,614	·05
September ...	3,780	September ...	3,159	8·91
February ...	3,731	October ...	2,982	·79

comparison with the other months of that year healthier, in the same months in 1884, with ·57 inches of rain, the suffering was very excessive. This is accounted for by the fact that the winter prevalence of the disease incidental to the Province was more general during the year under review, as 21 districts exhibited this phase of the disease during it against only 11 during 1883.

Seasonal prevalence of Cholera in Bengal, Behar, Orissa and Chota Nagpore.

38. *Bengal.*—There was no material difference in the seasonal incidence of Cholera in this division of the Province during this year in comparison with former years. As usual, it prevailed with marked severity during the months of March to May, and again during January and October to December, the intervening months, during which the rainfall was heaviest, enjoying much exemption. During the spring months the severity of the disease was felt most in the Western districts of this Division, in the Southern portion of the Central districts, and in the Eastern districts, particularly in the Dacca Division. The fatality of the winter outbreak was greatest in the Central districts, excepting its hill portion, and in the whole of the Eastern districts, while in the Western districts the loss of life was less. In the hill portion of the Central districts—in Darjiling and Julpaiguri—the prevalence of the disease was very mild throughout the year: in fact no fatal results occurred in the former district during January, February, May, and October to December, and in the latter during January to March and December.

Behar.—The months of severest suffering in this Division were, as usual, May to August; the period of heaviest rainfall, and the death-rates in all its districts, excepting Mozufferpore, Durbhanga, Chumparun and Purneah were high during these months.

Orissa.—The intensity of the disease in this Division was great throughout the year, but the months of maximum suffering were May to July and November. This is to some extent usual. It will be observed that there is a marked difference in the seasonal incidence of the disease in Orissa in comparison with Bengal. I will revert to this subject, and explain the cause when narrating the history of cholera in the Orissa districts.

Chota Nagpore—In this Division the disease exhibited greatest activity during April to August, the districts of Hazaribagh and Manbhum contributing to the enhancement, while Lohardugga and Singbhum enjoyed great freedom, no deaths occurring in the former during January to April and October to December and in the latter during January, August, September and December.

Prevalence of Cholera as delineated by the Cholera Map.

39. The map illustrating the distribution of Cholera in the Province, appended to this Report, presents the following features:—All the northern districts, viz. Chumparun, Sarun, Mozufferpore, Durbhanga, Bhagulpore, excepting its Sudder and Banka sub-divisions in the south, Beguserai the northern sub-division of Monghyr, Purneah, Darjiling, Jalpaiguri, Dinagepore and Rungpore were comparatively very free from Cholera. Similar exemption was enjoyed by the sub-divisions of Bishenpore in Bankurah, Jehanabad in Hughli, Dum-Dum and Bussirhat in the 24-Pergunnahs, Fenny in Noakhalli, Jehanabad in Gya, Bhabua in Shahâbad, Dumka in the Sonthal Pergunnahs, and the Sudder in Hazaribagh and by the entire districts of Lohardugga and Singbhum In all the above-mentioned areas the mortality was below 10 per 10,000 of population. On the other hand, the suffering was very great in the undermentioned sub-divisions, the deaths in them ranging from 32 to 92 per 10,000 of population:—

40. Of the very large number of Fairs held in the districts outbreaks of Cholera occurred only in the following:—In *City Murshidabad* during the Mohurrum, when about 10,000 people were assembled, cholera broke out and caused about 100 deaths. All sanitary precautions appear to have been taken,—temporary latrines were provided; surface cleansing was attended to with regard to roads, lanes, serais, resting places, &c; washing of clothes in the river and otherwise polluting its water was prohibited, &c The Magistrate believes that this outbreak is referable to the "effect of dissipation and bad food." Two cases of Cholera and eight of Choleraic diarrhœa, none ending fatally occurred at the Mongalbund fair in *Dacca*, held on the 2nd and 3rd of April, among 95,000 people who had assembled from several districts, including Dacca. There were also 3,000 boats on the river. The people dispersed as soon as they heard of the outbreak. No report has been furnished as to the sanitary precautions which were adopted. Five cases of Cholera, attended with four deaths, occurred at the Kartick Barooni mêla held at Munshigunge in the same district. This fair lasted six weeks, from the 3rd of November, and the gathering numbered 141,413, the daily average being 3,282. There were 12,117 boats on the river. The sanitary precautions adopted were all that could be desired. At the Punasankranti mêla, held at Kuntollo, pergunnah Jhunkur, in *Cuttack*, cholera broke out, and six persons died. No special sanitary precautions had been taken.

Cholera at Fairs

41. The main facts connected with the incidence of Cholera in the districts and brief accounts of local outbreaks are subjoined.

Incidence of Cholera in the Districts.

BENGAL.

42. The returns show that in *Bengal Proper* 95,314 deaths were recorded as having occurred from Cholera among its population of 35,073,770 in 14·14 per cent. of the villages, and that the proportionate death-rate to population was 2·71 per 1,000. The casualty rate in the preceding year was 1·55 per 1,000 in 8·90 per cent. of the villages, and in the quinquennium 1879-83, 1·51 per 1,000 in 9·62 per cent of the villages. The comparison indicates that the disease pervaded a much larger extent of the country, and the mortality was considerably higher. Next to Orissa, the suffering was greatest in this Division of the Province.

Cholera prevalence in the Bengal Division of the Province

43. The Cholera statistics of the Burdwan Division of Bengal are presented below —

Cholera prevalence in the Burdwan Division

	Districts.	Percentages of Villages Attacked.		Mortality in 1884		Difference in 1884 in Death Rates as compared with—		Unhealthy Months
		In 1884	Excess or deficit as compared with 1883	Number of deaths.	Ratio per mille	1883	1879-83	
Western Districts.	Burdwan	9·29	3·[illegible]0 I	2,285	1·64	·38 I	·09 I	March to May
	Bankura	4·13	2·56 I	1,177	1·1[illegible]	·68 I	·26 I	Ditto
	Birbhum	6·71	5·00 I	1,108	1·16	1·09 I	·09 I	April May November and December
	Midnapore	7·15	·24 I	3,8[illegible]	1·[illegible]4	·05 I	·26 I	January to June and December
	Hughli, including Serampore	13·18	3·75 I	1,[illegible]90	1·55	·02 I	·28 I	February to May November and December
	Howrah	18·14	5·09 D	1,510	2·39	·61 D	·19 I	January to May and December
	Total	7·86	1·56 I	11,403	1·54	·25 I	·21 I	March to May and December

The figures indicate that in this Division 11,403 persons, or at the rate of 1·54 per 1,000 of population, succumbed to Cholera; that in connection with the periods with which comparison is instituted its prevalence was, on the

whole, more diffused and the casualty rate higher, but not excessively so; and that the disease was most active during the months of March to May and December.

44. *Burdwan.*—In this district a much larger number of villages, the excess being represented by a percentage of 3·30, were over-run by Cholera, and the mortality was higher by only ·38 per 1,000 of population in comparison with the preceding year, and ·09 per 1,000 with the lustrum 1879-83. March to May were the most unhealthy months, and in the areas named in the margin the largest losses of life were recorded. In Assensole thanah and Ranigunge town, which head the list, 33 per cent. of the total casualties of the year occurred. With reference to this high mortality the Joint-Magistrate observes:—"The streams of pilgrims and challans of coolies from the labour districts continued unabated. All along the Grand Trunk road and Poori road Cholera broke out, and for this reason, I think, the cause of the outbreaks may be safely attributed to the travellers on this road." The villages in several thanahs in Birbhum, Bankurah and Midnapore are also either directly on, or not far from pilgrim routes, and they should have suffered similarly if the above theory is correct. The Civil Surgeon of the neighbouring district—Bankura—has, however, as shown hereinafter, definitely expressed the opinion that the mortality from cholera in his district in 1884 had no connection with pilgrims, or rather that the disease could not be traced to importation by pilgrims. As the subject is an important one, I think it would be useful to examine it statistically. For this purpose, I submit in the subjoined table the death-rates from Cholera in 1884 and during the lustrum 1879-83 in Ranigunge and Assensole and in the above-mentioned districts, selecting those thanahs in them in which the mortality preponderated. In connection with this subject attention is also solicited to Cholera mortality during the same periods in Cuttack, Poori and Balasore, exhibited in the portion of the Report devoted to the discussion of the history of Cholera in Orissa.

Before drawing deductions from the statistics presented in the above table, it is necessary to indicate the dates on which the festivals are held in Poori town, to which most of the pilgrims are attracted. This information is furnished in the margin, but it is important to observe that the most celebrated of the festivals to which the largest number of pilgrims flock is the

Festivals	Commences	Ends.	Number assembled about.
Shivaratra Jatra	25th February	26th February .	60,000
Melon or Dol "	11th March .	12th March ...	30,000
Chandan ,	28th April .	10th May ...	20 000

Jhulan "	2nd August ...	8th August ..	5,000
Punchak " .	30th October	3rd November	30,000

Rathajattra, and that this festival commences on the 25th of June and ends on the 10th of July. The months then during which the pilgrims would be passing through Birbhum, Bankura and Midnapore *en route* to Poori would be February to May, and the return journey would occur in July and August. Now, the conclusions which may be legitimately arrived at in connection with the subject under discussion from an examination of the data furnished in the foregoing tables are :—

(1)—That in point of intensity with which the disease prevailed during the period embraced by the table, there is no such agreement between Ranigunge and Assensole and the thanahs in Birbhum, Bankura and Midnapore, as, judged from either the aggregate or seasonal death-rates which occurred in the areas in question, would justify the inference that the high mortality in Ranigunge and Assensole is referable to pilgrimage independent of climatic influences, or local insanitary conditions, or the other unknown causes which produce the disease.

(2)—That as pilgrims *en route* to Poori pass first through Birbhum, then through Ranigunge, thence to Bankura, and last through Midnapore, whence they enter Balasore, the natural consequence would be, if pilgrims caused Cholera, that Birbhum would have presented noticeably high death-rates earliest, Ranigunge next, Bankura later, and Midnapore still later, but the figures in the table show that the months of conspicuous and maximum suffering were the same in Ranigunge, Assensole, Bankura, and Debra in Midnapore, viz. April and May, and what is more remarkable is that the earlier months of the year, January to April, were the months in which highest mortality is seen to have occurred in the other thanahs in Midnapore where pilgrims arrived last.

A further examination of the Cholera statistics of Birbhum, Bankura and Midnapore shows that several thanahs in them, not mentioned in the foregoing table, but through which pilgrims also passed, enjoyed great immunity from Cholera, while other thanahs in the same districts, which are not pilgrim routes, suffered severely—*vide* marginal figures.

Under the above circumstances, I think it unfair to infer that cholera is disseminated by pilgrims *per se*, or that they communicate the disease wherever they go. The fact is that when cholera, engendered by causes not yet definitely determined, and fostered by climatic influences or local insanitary conditions, is prevailing in any locality, pilgrims, if present there, suffer in common with the local residents, often more severely, owing to fatigue, old age, debility, bad food or water, crowding, &c.; but they do not import or communicate the disease. They, however, continue to suffer during their onward journey, if the wave of the disease is travelling in the same direction, and the people residing in the localities traversed by this wave also suffer along with them. The disease appears in places far removed from pilgrim routes, and it is during the dry months that it prevails with intense severity generally in every district in Bengal Proper, whether pilgrims are present in them or not during that period.

Of the seven Cooly depôts in Burdwan, only three were affected by cholera and they were closed. Rather smart outbreaks occurred in the collieries at Saktoria and Desherghur, but prompt measures were taken by the Managers to arrest the progress of the disease.

45. *Bankura.*—In this district also there occurred a further extension of the disease and higher mortality, the former involving an additional 2·56 per cent. of the villages, and the latter showing an increase of ·68 per 1,000 of population

contrasted with the death-rate in 1883, and ·26 per 1,000 with that in the quinquennium 1879-83. Exceptionally high casualties were returned by only the Bankura town (3·73 per 1,000) and Soopore thanah (3·66 per 1,000). The months of greatest suffering were March to May, the maximum being reached in the last-named month, followed, as in the preceding year, by almost total exemption during the rest of the months in all areas, excepting the Bankura town, where the winter prevalence of the disease was also somewhat severe. It may be here observed that the disease ran the course corresponding to the one followed in Lower Bengal generally, and exhibited no tendency to reach a maximum in July as in Orissa. The earlier outbreak in the Bankura town was a smart one, and occurred in March, decreasing till May, and disappearing then. Another noticeable outbreak occurred in thanah Khatra in January, with 72 deaths as a maximum, and running on with less severity into July. It is worthy of note that this thanah entirely escaped the scourge in 1883. The Civil Surgeon notes that the towns of Bishenpur and Sonamukhi enjoyed almost total freedom; but as these towns are in a notoriously insanitary condition, such immunity is not likely to continue long. There seems to have been no connection between cholera and pilgrims passing through the district in 1884, as the main road of travel almost entirely escaped, and no cases occurred in the numerous villages situated along it. The pilgrim road does not go through Bankura town, but passes outside and to the north, and pilgrims are prevented by the police from entering it. The first of the cases in the outbreak above referred to appeared in the eastern end of the bazar, adjoining the pilgrim road, but in the persons of resident Chumars, and there is no history of contact in any way with pilgrims.

46. *Birbhum.*—This district did not experience the like great immunity from Cholera, which it enjoyed during the preceding year. A much larger extent of country, represented by an additional five per cent. of the villages, was pervaded by the disease, and the death-rate was higher by 1·09 per 1,000 of population. The disease appeared in February, was active in March, and reached maximum severity in May, these being the driest months of the year. A decline was seen with the setting in of the monsoon, but in November and December the disease was again active, "daily counting its victims up to the close of the year." During the first outbreak the disease was chiefly confined to thanahs Dubrajpur and Nulhati, and the winter accession to thanah Labpur, but thanahs Bolepur and Sacoolipur suffered during both the visitations; and these thanahs, Dubrajpur and Labpur excepted, returned the highest death-rates, viz., Nulhati 2·57, Bolepur 2·31, and Sacoolipur 1·82 per 1,000 of population. The Rampurhat thanah again experienced great exemption, although the casualties were slightly larger. The sub-divisional officer reports that he considers it worthy of remark that his efforts to arrest the progress of cholera by disinfecting the affected localities with sulphur, prohibiting the use by others of the water of tanks resorted to by those attacked, throwing lime into the tanks, &c., should have proved successful repeatedly in dozens of villages. It was noticed that the prevalence of the disease was not confined to any particular village, but was spread over several villages, the combined mortality in which made the district death-rate high. Nor did it assume epidemic proportions anywhere, except in the villages of Bairee and Mohanpore, situated respectively in thanahs Bolepur and Sacoolipur where out of a population of 1,918 and 541, 89 and 60 died. The Magistrate reports that the disease was introduced into Shahpur, a village west of Elambazar, by some of the inhabitants on their return from a visit to Burdwan, and that it spread to an adjoining village, the people of which used to work in Shahpur. The outbreak at Bairee he attributes to the too early eating of new rice.

47. *Midnapore.*—In this district there was no tangible increase, either in the prevalence or fatality of cholera, the percentage of villages attacked being 7·15 against 6·91, and the death-rate 1·54 as opposed to 1·49 in the preceding year; but it is observed that the disease has been annually increasing since 1880. In seasonal fatality, Midnapore exhibits a difference as compared with all districts in the Burdwan Division, excepting Howrah, as high mortality is seen to have prevailed from the beginning of the year, abiding progressively to June. It should, however, be observed that the Cholera of this period was a sequence

to the cholera which prevailed in the last month of 1883. December was also an unhealthy month. Not a single circle escaped the invasion of the disease, and the highest suffering was experienced by those named in the margin. The circles numbered 2, 3, 4, 6 and 9 always suffer, and are said to be affected by the passage of pilgrims through them from the Gunga Saugor fair. As this fair is held in January and lasts about a week, and as the predominating mortality in these circles occurred in the earlier months of the year, a connection between cholera and pilgrims is probable, although not absolute.

In the Midnapore town, which ranked highest in cholera mortality, the outbreak commenced in January and lasted up to August, being excessively severe in April and May. Every mohullah in it was affected, and 527 persons were attacked, of whom 250 died. Especial care was taken to confine the passage of pilgrims to the route provided for them outside of municipal limits, and no cholera patient was admitted to the dispensary in the town. Hence the disease could not be referred to importation by pilgrims; but in one or two instances the first cases of the disease were found to have occurred in new arrivals (not pilgrims) from infected localities. It was noticed that the shop-keepers and lower classes of the people, who were indifferent regarding their water-supply, which was bad, and whose habits and surroundings were most objectionable in a sanitary point of view, suffered most, while those who were particular in these matters entirely escaped. With regard to thanahs Egra and Sutahatta, Assistant Surgeon Priumber Nath Mitter, Deputy Superintendent of Vaccination, Metropolitan Circle, says that the habits of the people in the former thanah are very filthy; that rotten fish is their daily food; and that its water-supply is in its worst state—and that Cholera is endemic in the latter thanah; that its conservancy is bad; and that, although the Huldi river drains it, there has been no flooding here for the last 20 years. The following facts, the result of the personal observations of the Civil Surgeon during this outbreak, claim attention, viz. (1) that of those who took their drinking-water from a tank or well supposed to have been contaminated with cholera poison, only about one in 20 were attacked by the disease; (2) that of the people who were exposed to the poison, whatever it was, which influence the progress and distribution of the disease, the bulk escaped, the number actually attacked being relatively very small; and (3) that while the above-mentioned outbreak and that of 1869, which occurred in the same localities and was also very severe, were preceded by prolonged deficient rainfall, causing the tanks and wells to fall very low, the drought of five months in 1871, when not a single drop of rain fell, and when the conditions considered to be specially favourable to the production of the disease—dryness and concentration of filth in tanks—also existed, was not followed by any unusual prevalence of cholera. The sanitary condition of the Midnapore town is bad, and no tanks have been set apart for drinking purposes. In the pilgrim route from Pooree eight cases of cholera among pilgrims were reported to have occurred at Dantun, a large village in the south, and one at Gurbetta in the north of the district. It should not, however, be overlooked that cholera is endemic in the district, and that its rise and fall correspond with those of Lower Bengal, and that the marked rise of June and July observed in Orissa is absent. It is worthy of notice that, as stated by the Civil Surgeon, since the water-supply of the Midnapore Jail was improved in 1881, only five sporadic outbreaks of cholera, each limited to a single case, occurred in it; that although during this period the disease frequently prevailed in the town, the jail was practically free from it; and that when it does appear it fails to spread. Anterior to this period the outbreaks "were formidable."

48. *Hughli.*—In this district 1·35 per 1,000 of the population died in 13·18 per cent. of the villages, against 1·33 per 1,000 in 9·43 per cent. in the preceding year, indicating that, on the whole, a much larger portion of the district was invaded by the disease, but unassociated with any excessive increase of mortality. Nevertheless, the mortality in the circles marginally named was

conspicuously high. The disease was present in the district throughout the year, but displayed the greatest activity during February to May, and again during November and December. From the list furnished above it will be seen that the Serampore town suffered the most. Here there occurred a sudden, severe, and very fatal outbreak in the bustees of Rishra and Mohesh (which are attacked annually), almost entirely among the coolies in the jute mills. It commenced on the 17th November and lasted for about three weeks, during which 214 persons were attacked, of whom 118 died. The bustees are densely crowded, are in an insanitary condition, and the habits of the people residing in them are filthy. I saw the place and found its sanitary condition very bad. It was noted that, although the coolies mixed freely with the Bengalis and others residing in the neighbouring bazar, and also frequented the market, held in the centre of these bustees, cholera did not affect those with whom communication was held, nor did it spread to other localities. Among the measures adopted to arrest the progress of the disease, which were attended with great benefit, the following may be noted,—burning wood fires and sulphur on a very large scale, closing an overcrowded burial ground, and covering the old offensive graves with waste jute a foot deep; setting fire to it, and then covering it a foot deep with ashes from the mills; putting a stop to corpses being only half-burnt on the banks of the river; covering the drains with quicklime; and preventing people from resorting to suspected tanks. Great credit is due to Mr. Collier, the sub-divisional officer, for personally supervising all the sanitary arrangements which were adopted to mitigate the severity and spread of the disease; to Dr. Barker, the Civil Surgeon, for the large share of personal labour which he devoted to visiting, taking care of and treating the sick; and to Mr. Finlay of the Hastings Jute Mills for supplying medicines, disinfectants and good water, and for personally aiding Mr. Collier and Dr. Barker in their work. The Uterparah town appears also to have suffered excessively, but no account has been furnished of the outbreaks which occurred in it. The sanitary condition of this town is very bad, and there is great need for a better water-supply than that afforded by the tanks, which are very foul.

49. *Howrah.*—In this district 2·39 per 1,000 of the population fell victims to Cholera in 18·11 per cent. of the villages. Compared with the preceding year, the suffering was less: but the disease was much more widely diffused, and the mortality considerably higher than in all the other districts comprising the Bardwan Division. As usual the disease, prevailed intensely during the months of greatest dryness, commencing from October 1883, increasing through the cold weather, lasting till May of this year, and reaching maximum severity in April. After this it declined remarkably in all areas. There was a second or winter visitation commencing in October, but its severity was confined to the Howrah and Bally towns. These towns also suffered most severely during the earlier outbreak and returned the highest death-rates, viz. 7·78 and 4·72 per 1,000 of population respectively. The Shampur thanah also suffered exceptionally, the mortality being represented by 3·00 per 1,000 of population. In the Howrah town the largest number of cases of cholera occurred in the Golabari and Howrah wards, and the Magistrate says that the severity of the disease would have been greater had not the Municipality made strenuous and successful exertions to supply the dried-up tanks with water. The Civil Surgeon is of opinion that an abundant and pure water-supply would no doubt mitigate the ravages of cholera in this town. With regard to Bally, Dr. Ghose, the Officiating Deputy Sanitary Commissioner, Metropolitan Circles, reports that he found the water-supply of the town bad, as a large number of the tanks were in a filthy condition, admitting surface drainage, and the river water, with a considerable amount of silt, passes into some of the tanks through a badly constructed drain with faulty level during spring tide, owing to the sluice put up to prevent this being out of order. He also noticed that one of the trenching grounds situated in this town, but belonging to the Howrah Municipality, was in a most scandalous condition, quantities of filth being thrown about instead of being buried, and when buried the process was so imperfect that the decomposing filth bubbled up through the loose earth. The conservancy arrangements were also not quite satisfactory.

Cholera prevalence in the Presidency Division.

50. The subjoined table furnishes the specific facts connected with Cholera prevalence in the Presidency Division:—

Districts.	Percentage of Villages Attacked. In 1884.	Excess or deficit as compared with 1883.	Mortality in 1884. Number of deaths	Ratio per mille.	Difference in 1884 in Death Rates as compared with— 1883.	1878-83.	Unhealthy Months.
Central Districts (South) 24-Pergunnahs	18·16	2·04 *I*	6,698	3·57	·10 *I*	·98 *I*	January to June, November and December.

Total ..	24·29	7·12 *I*	31,832	4·09	1·34 *I*	1·65 *I*	January to May, November and December.

This table shows that in the Presidency Division of Bengal the number of casualties caused by Cholera amounted on the whole to 31,832, yielding a death-rate of 4·09 per 1,000 of population; that a much larger extent of the country was invaded by the disease, and the mortality considerably higher than during the preceding year; and that the months which presented the most casualties were January to May, and again November and December, the earlier visitation not constituting a fresh outburst, but a continuation of the Cholera which was prevalent during the last months of the preceding year. It should be noted that the suffering in this area was the highest in comparison with all the divisions in the Province, Orissa only excepted.

51. 24-*Pergunnahs*.—In this district Cholera carried off 3·57 per 1,000 of the population in 18·16 per cent. of the villages. Compared with 1883, it is seen that an additional 2·04 per cent. of the villages was traversed by the disease, and that there was an increase in mortality to the extent of ·10 per 1,000 of population. The disease was present during every month with varying intensity, but the worst months were January to June and November and December. It attacked all the circles and was most fatal in the 18 named in the margin. The Suburbs of Calcutta again heads the list with an increase in mortality of nearly one per 1,000 of population, as compared with the death-rate of 1883. The mohullahs in it which formed the scene of greatest suffering were Balliaghatta, Entally, Bhowanipur and Watgunge. This Municipality was specially inspected by me and found in an extremely insanitary condition. A report embodying the defects and indicating remedies was sent to the Commissioners, and a copy thereof submitted to Government. An abstract of this report, with a note of the action taken by the Commissioners on the suggestions therein made, will be found in Appendix III to this Report. Some of the officers of the Vaccination Department visited the Suburbs of Calcutta, and several of the other localities where exceptional mortality from cholera occurred. Assistant Surgeon Priumber Mitter, Deputy Superintendent of Vaccination, Metropolitan Circles, records the following observations in connection with some localities in the Suburbs and in the North and South Suburban Towns. *Manicktollah* is the most filthy part of the Suburbs, the land behind houses being used as public latrines. In fact, all the bustees in this area are in an extremely insanitary condition from *fæces* and house refuse lying on the roadsides, lanes and bye-lanes, and the ponds, hollows, and low lands being the receptacles of liquid sewage and filth. *Garden Reach*.—All the bustees here are in a similar insanitary condition with regard to conservancy, drainage, roads, &c. *Sett Bagan and Ghose Bazar*.—In these and the neighbouring bustees foul water holes, containing decaying vegetation, abounded; there are many filthy private privies; the water in two large tanks was filthy, green in colour and turbid, and two of the smaller ones were covered with

decomposing plants, their sides lined with rank vegetation, the water in them "appearing like vegetable decoction emitting disagreeable odour." *Ballygunge.*—Here the waste lands were found to be covered with litter and other refuse, and were resorted to for defœcation. *Gungarambusti and Wolfutbazar.*—These were found in their usual state of uncleanliness without any arrangement for the removal of sewage and refuse. *Matiabrooj, Mooriali, and Kanchisharak* were so crowded as to prevent free perflation of air, and their courtyards and compounds were extremely filthy. In *Ekbalpore* some of the drains were filthy and obstructed, and the cowsheds full of decomposing litter and refuse. *Baniapooker.*—Here the drains were filthy and emitted a sickening odour, and the ditches and low lands covered with *fæces*, rank vegetation and refuse of every description. The water-supply in all its bustees was bad, drinking-water being taken without any regard as to its quality; many of the houses were deficient in ventilation, the ground about them damp, and no arrangements existed with regard to house scavenging. *Bhowanipore*—This place was in an indescribably insanitary condition, and its bustees do not admit of free scavenging. The tanks are foul and the drains, with few exceptions, are defective in level. *Watgunge.*—Some of the ditches here contained weeds, house sweepings, and human excreta, and the receptacles in one of the latrines were overflowing with *fæces* emitting an abominable odour. *Kalighat in Tollygunge.*—Although some improvements had been effected, the sanitary condition of this locality is yet very defective with regard to scavenging, cleanliness, ventilation and crowding of huts. The latrines were most filthy, the vessels in them overflowing with decomposed bubbling *fæces*, seats unclean, and the latrine too near a much-used tank belonging to the police. The remarks of Dr. Ghose, the Officiating Deputy Sanitary Commissioner of the Metropolitan Circles, who also visited most of the above-named localities, are equally condemnatory. His reports also expose many extremely insanitary conditions obtaining at Cossipore, Baranagore, Barripore and Joynuggur thanahs, and Baraset Municipality. I would be extending my Report to an undesirable length were I to reproduce all the defects disclosed in the reports of the officers of the Vaccination Department. It will suffice to say that the above description applies *mutatis mutandis* to several other localities in the Suburbs, one of the largest and most important of the Municipalities in Bengal, and to other towns and thanahs in the Province. It may be noted here that some judicious recommendations made by Dr. Ghose, after careful inquiry and inspection of several bustees in the Suburbs, do not appear from his later reports to have been followed by any action on the part of the municipal authorities.

52. *Nuddea*, with a death-rate of 5·79 per 1,000 of population, occupies the second place in the list of cholera-stricken districts. Its death-rate exceeds that of the preceding year by 1·10 per 1,000 of population, and that of the lustrum 1879-83 by 2·27 per 1,000, and was, in fact, higher than the casualty rate of any individual year since 1876, excluding 1882. The disease also prevailed very extensively, overrunning 40·72 per cent of the villages, which proportion exceeds that of 1883 by 5·81 per cent. The localities marginally named exhibited the highest mortality. During the opening month of the year the scourge was present in several thanahs; in the second month it invaded a considerably larger number of them, and, progressing in activity, attained maximum intensity in April, when every circle was affected. After April its severity subsided, so that in June the district was comparatively free from the pest, and this immunity continued throughout the rainy months; but with the advent of the cold weather an invasion again occurred which, continuing up to December, passed on to 1885. This is the usual behaviour of the disease in this district. On the whole, its severity this year is attributed to bad water-supply, which was general throughout the district owing to scanty rainfall causing the tanks and water reservoirs to run very low, to defective drainage, to the filthiness of the villages, and to want of wholesome

food. In Gangni, which suffered excessively, the water was taken from the pools in the khals into which only local drainage enters, and in which bathing, both by men and cattle, is carried on. There is a great want of wells in this district, and the people object much to the use of well water, and their objections are natural, considering that the wells are shallow—mere holes on the village site—and the water in them brackish and contaminated with filth. Should, however, wells be sunk to tap the deep water-bearing stratum, as recommended by Mr. Hughes, lately Superintending Engineer of the circle in which Nuddea lies, I have no doubt that the people would gladly avail themselves of the pure supply. A limited experience of a few good wells supports this view. It was observed that the Mahomedans in some of the villages buried their cholera dead near their houses. Considering the little depth at which corpses are interred, the practice is productive of infinite harm. In the sub-division of Ranaghat, which also ranks high in Cholera mortality, good water was also scarce, and the bhils from which a large section of the people draw their drinking supply had silted up. The sub-divisional officer attributes the prevalence of the disease to these causes, combined with the general insanitary condition of the villages. The Magistrate, Mr. Hopkins, referring to the causation of the disease, writes:—"I am inclined to think that the disease has very little of cholera in it, but is the result of the hot weather acting on the absolutely poisonous water and sometimes poisonous food indulged in by the people"; and further on in his report he pertinently observes that "there is no doubt that some one in these large flat districts ought to have summary powers to remove obstructions to the water-supply, to create obstructions to floods and inundations, without being liable afterwards to the wrong of civil litigation. At present it is impossible to get through all the formalities of the law under something like six months. District officers should be given the power to do good, and they would do a great deal more good than harm. They have not the time to report and make estimates and surveys in urgent cases, nor will they willingly undertake the responsibility of proceeding under section 25, Act II (B.C.) of 1882 [relating to embankments and water-courses] for even if they satisfy themselves of the imminent danger, the responsibility of satisfying others, after the fact, is disagreeable and precarious." The Nobodip town, in which 5·24 per 1,000 of the population fell victims to Cholera, is in a very insanitary condition. It is not provided with public latrines; there are about 400 well-privies, 15 to 20 feet deep, in it, from which the excreta is removed at lengthened periods, and then only buried in close proximity to them at a depth of eight to ten feet; the drainage is defective, all the drains being kutcha and the receptacles of the filthy contents of the house drains; and interments take place in the compounds of the houses. These are the chief defects. Moreover, being regarded as a sacred place, it is visited by a large number of pilgrims, for whom there is no special accommodation. The Meherpur town, which recorded a death-rate equal to that of Nobodip, is similarly badly sanitated. There is no house scavenging; no public or private latrines; there are about a hundred well-privies, which are very seldom cleaned owing to difficulty of obtaining mehters; the drainage is defective. The Bhyrub river has silted up and its water become stagnant, and the wells afford a scanty supply. The only fairly good water obtainable is from the municipal tank. Preliminary steps have been taken to open out the mouth of the Bhyrub in the Meherpur sub-division, and to form a junction of the Kistopur and other bhils with the Gorai river in the Kushtea sub-division.

53. *Jessore.*—The prevalence of Cholera in this district resulted in a death-rate of 3·38 per 1,000 of population in 20·18 per cent. of the villages, as opposed to the death-rate of 2·21 per 1,000 and 15·36 per cent. of villages attacked in the preceding year, indicating an increase in both the diffusion and fatality of the disease. Its seasonal incidence corresponded with that in Nuddea, and the marginally noted circles experienced the greatest suffering. The local reports again furnish no special information bearing on the severity with which the disease

prevailed in these circles. It may, however, be mentioned with regard to the town of Jessore that its unhealthiness is in some measure due to the insanitary conditions obtaining in it, for the general conservancy is not properly attended to; the privies are filthy, the attendance of the mehters being irregular; the night-soil is not properly trenched; the drainage is defective, as most of the drains are mere open ditches, and some of the bazar drains are obstructed by refuse from shops, the culverts being used as receptacles for rubbish; very nearly all the tanks contain organic matter, being open to every description of pollution; and the graves are not dug sufficiently deep, so that the openings made by jackals to obtain access to the corpses emit gases deleterious to health.

54. *Khulna.*—In this district also the prevalence and fatality of Cholera were considerably greater, the former extending over an additional 11·25 per cent. of the villages, and the latter involving an increase in death-rate to the extent of 1·08 per 1,000 of population. The fourth quarter of the year was the most, and the third quarter the least unhealthy, as was the case in the two preceding years. The disease was nowhere epidemic, but it prevailed in sporadic form simultaneously in different parts of the district. Nevertheless, in the marginally named circles it proved conspicuously fatal. In the Khulna thanah, out of a total of 3,233 deaths, 203 were recorded in one month,—November. No account has been furnished by the local officers in connection with the high mortality in these circles. Dr. Ghose, the Officiating Deputy Sanitary Commissioner, Metropolitan Circles, however, records that Cholera is a regular visitor in several villages in thanah Kaligunge, and that, although the rivers and khals of the place facilitate drainage, the water-supply is bad. It might be mentioned that the outbreak of cholera in the town of Khulna among the coolies in the Government brick-fields, referred to in the last year's report, and which continued to prevail up to January of this year, was found to have been originated by the affected drinking water from a small tank which was suspected to have been polluted with cholera poison, as evidenced by the fact that the disease disappeared soon after the closing of this tank against the public, and that the servants of the Sessions Judge on circuit, who drank the water of this tank notwithstanding the prohibition, were all attacked by bowel-complaints, and two by cholera.

55. *Murshidabad.*—In this district the incidence of the disease was very severe, as the casualties were greater by over five times the number of the preceding year; the death-rate amounting to 4·99 per 1,000 of population against ·96 per 1,000. The extent of country invaded by the disease was also considerably greater, 22·35 per cent. of the villages having been attacked against 6·38 per cent. The Civil Surgeon notes that, although usually endemic, the disease assumed epidemic proportions this year. There were two severe outbreaks, the first commencing in March, reaching maximum severity in April (when 3,188 or more than half the total casualties of the year occurred), and continuing with severity during the next month, disappeared almost entirely after that month. The second invasion took place in October, attacking at first a few of the thanahs, and continued to the end of the year, proving most fatal in November, when a large majority of the circles was involved. That the disease was severely widespread is seen from the fact that on the whole 19 (named in the margin) of the 27 circles in the district presented very high death-rates. The severity of the disease is generally referred to scanty rainfall, it being, it is said, an observed fact in this district that epidemic outbreaks of cholera are more frequent and more severe when there is less moisture in the earth. In the Jungipur town the Baliaghatta ward suffered the most, but the spread of the disease was, it is stated, arrested by improving the conservancy arrangements, which were very objectionable, there

being no public latrines, the night-soil not being effectually dealt with, if at all, and surface cleansing unattended to. In the Jungipur sub-division in all the thanahs (Raghunathganj, Dewanserai, Shamsherganj, Suti and Mirzapur) in which the mortality was very great, the water in the Bhagirutti river becomes stagnant during the hot weather, and that in the tanks is contaminated by bamboo leaves falling into them. The local reports do not furnish any special information regarding the rest of the very large number of severely stricken areas.

Cholera prevalence in the Rajshahye Division.

56. The figures indicating the incidence of Cholera in the Rajshahye Division are submitted in the subjoined table:—

		Percentage of villages attacked.		Mortality in 1884.		Difference in 1884 in death-rates as compared with—		Unhealthy Months.
		In 1884.	Excess or deficit as compared with 1883.	Number of deaths.	Ratio per *mille*.	1883.	1878-82.	
Central Districts. (South.)	Dinagepore	2·10	·57 *I*	481	·31	·11 *D*	·10 *D*	November and December.

	Total ...	7·75	3·82 *I*	14,316	2·97	3·82 *I*	1·25 *I*	March to May and October to December.

This table shows that, with varying incidence in individual districts, both the extent of prevalence and fatality of Cholera were on the whole greater than in the preceding year in the Rajshahye Division; that to this increment the Rajshahye, Pubna and Bogra districts contributed mainly; and that the disease was most active during March to May, and again during October to December.

57. *Dinajpur* enjoyed, as in 1883, much immunity from Cholera, and while there was a small increase in area attacked, the mortality was lower. The total death-rate amounted to only ·31 per 1,000 of population, and this occurred in only 2·10 per cent. of the villages. Dr. Mukerjee refers the causation of the disease to inter-river communication of the affected villages with contiguous localities where the disease was present, and to contaminated water-supply. Of outbreaks due to the first mentioned cause, which had been previously enquired into by him, the following connected with a severe outbreak in Chintamon and its neighbouring villages may be cited. A woman had gone across the river Mohanunda to village Ashapore, in Maldah, where the disease was raging, to nurse her cholera-stricken grand-child. The child died. On her return with her clothes soiled by cholera excreta, &c., of her grand-child, her husband was attacked, and the disease spread into the neighbouring houses, which were close to each other. It was ascertained that soiled clothes, &c., were washed in the river, and that its water was used for all purposes. Dead bodies had also been thrown into the river, or buried on its banks.

58. *Rajshahye.*—The mortality in this district was very great. The disease invaded a considerably larger number of villages, represented by 10·65 per cent. of additional villages, but on the whole it was not very widespread, as only 17·39 per cent. of the total villages were affected. The mortality, however, was very high—4·95 as opposed to 1·55 per 1,000 of population in 1883. The severity of the disease was manifested twice—once during January to June, and again during October to December—but it was most virulent during April and May. It was present in every circle, and caused great loss of life in the majority of them, viz. the ten named in the margin out of 14 in the district. The high mortality of the year is attributed to the water-supply having become deteriorated by silting up of the channels communicating with the Ganges, and to this evil having been intensified by the

diminished rainfall of three successive years having caused many large tanks to dry up during the hot season, thus compelling the people to use any available water. The severity of the disease in the Beauleah town was very high. It embraced the whole town, but, it was observed, that it was not very prevalent in the tracts on the banks of the river, where of course the water was plentiful, and certainly better than that from the dried-up tanks. But grave sanitary defects exist in this town; surface cleansing is not completely attended to; well-privies still exist, though to a limited extent; the public latrines are not generally used, the people preferring to resort for defœcation to a chur; sewage, ashes, house refuse, street sweepings, &c., are allowed to find their way into the roadside drains, which during the rains get dissolved and enter the tanks; excepting the reserved tanks, all the others are contaminated with surface drainage; and it is suspected that the Hindu pauper dead are thrown into the river, as no special arrangements exist for their disposal. In the Nowgaon thanah, which, on the whole, suffered least, the disease was very severe during the last quarter of the year, "when decomposed fish is most abundant."

59. *Rungpore.*—In this district the incidence of the disease was light, only ·55 per 1,000 of the population died in 2·87 per cent. of the villages. What cholera there was prevailed sporadically, but in November and December it displayed noticeable activity in the Govindganj and Nageshwari thanahs. The last-named thanah appears to be always suffering. It was observed that in May, when the rainfall was greatest, cholera prevailed least.

60. *Bogra.*—In this district Cholera prevailed with considerably enhanced severity, as the death-rate amounted to 1·90 per 1,000 of population, against ·33 per 1,000 in the preceding year. Although a larger percentage (6·33) of the villages were affected, the disease was not very widespread, as only 8·06 per cent. of the total villages was affected. Excepting the months of October to December, during which the bulk of the mortality took place, all the other months were comparatively free from the disease. The circles indicated in the margin furnished the highest death-rates. The prevalence of the disease was referred chiefly to scanty and bad water-supply. The former was caused by very deficient rainfall, and by the cultivators endeavouring to keep their young paddy crops alive by irrigation, and the latter by people steeping jute in the water. The use of bad and insufficient food, due to high prices for food-grains, is also believed to have caused an increase of the disease and consequent mortality.

	Ratio per *mille.*

Shariakandi thanah .	3·36
Dhunut	3·13
Sherpur	2·99

61. *Pubna.*—The immunity from Cholera which this district enjoyed in 1883 was not experienced this year, for the disease was considerably more widespread and fatal. The death-rate amounted to 3·36 per 1,000 of population in 15·92 per cent. of the villages, as opposed to ·18 per 1,000 in 2 per cent. The disease was present in the district in severe form during March to May, and again during October and November, being most active during the former period. Every circle returned higher death-rates, and those noted in the margin suffered the most. The cholera of this year commenced on the 3rd of January at Sara, the terminus of the Northern Bengal State Railway. It was of a severe type and alarming in the rapidity with which it spread from village to village, not attacking localities in succession, but spreading from distant centres until it covered all the intermediate places. Dr. ffrench-Mullen, who visited the locality, attributed the outbreak to the foul condition of a bhil or back-water of the Ganges, the water of which was used for drinking by the people of the affected villages. The local opinion is, that the disease was imported by Assamese emigrants. Dr. Dutt, the Civil Surgeon, found no evidence to support this opinion, but it appeared to him that from the contiguity and freedom of communication of the villages in question with the Rajshahye district, where the disease was very prevalent, the outbreak was an extension from that district. In the Pubna town there occurred 37 cases of cholera from the 8th to the 24th of April; but the medical and

Pubna town	6·87	Dulai " ...	3·82
Chatmohar thanah ...	4·66	Serajganj " ...	2·40

sanitary precautions which were adopted, at the suggestion of the Civil Surgeon, were followed by the arrest of the disease with 27 recoveries and 10 deaths. During another outbreak, which commenced on the 21st October and lasted to the 29th December, when 75 persons were attacked, under similar precautions 26 died and 49 recovered. The long resistance of this Municipality to the extra-mural burial of the dead, I have no doubt, partially accounts for these frequently recurring outbreaks of cholera. From the Magistrate's report I learn that the water-supply in this district is very deficient and highly polluted by the steeping in it of jute and hemp. The latter process causes greater deterioration than the former, as it takes place in the cold weather when the streams are lower and cannot be flushed by floods. It is, moreover, a common practice to burn dead bodies on the banks of bhils or old river courses, the water of which is used for drinking purposes.

62. *Darjiling.*—This district enjoyed great immunity from Cholera this year. The death-rate amounted to only ·17 per 1,000 of population in 1·16 per cent. of the villages, against 2·12 per 1,000 in 8·05 per cent. in 1883. The disease was almost confined to the plains—as in the hill tracts only one death occurred in the Darjiling town, six in the Darjiling rural area and no deaths in Kalimpong. Cholera having broken out twice on the Hope town spur, I instructed the Deputy Sanitary Commissioner, Darjiling Circle, to make an enquiry in all future cases of Cholera into the circumstances under which the disease breaks out, and to furnish a detailed account of the sanitary defects relating to drainage, conservancy and water-supply, specially to the fouling of the source by which water is conveyed from Sonadah; of the condition of the bazar and the quality of the flesh sold for consumption by the coolies. I also asked the Deputy Commissioner to direct the Civil Officers to bring to the Deputy Sanitary Commissioner's notice, for this purpose, all outbreaks of Cholera as they occur.

63. *Julpaiguri.*—Here also a very considerable reduction occurred in both the prevalence and fatality of Cholera, which was present in only 2·60 per cent. of the villages, against 19·87 per cent. and exhibited a death-rate of only ·35 per 1,000 of population against 4·17 per 1,000. The disease was almost limited to the Sudder sub-division, the Duars nearly escaping. In the former area Kairanti, Silliguri and Patgram suffered somewhat severely, the deaths in them amounting to 1·01, ·86 and ·83 per 1,000 of population respectively. As in former years, the disease appeared in April and became active in May and June and disappeared in November, the outbreaks of this year are referred to the generally insanitary condition of the district: the conservancy is bad; the drainage defective, so that during the rains all the low lands are flooded. The water consequently stagnates and decomposes and the evil is aggravated by the steeping of jute in it. This water is drank by the people.

Cholera prevalence in the Dacca Division.

64. The following table furnishes the Cholera statistics of the Dacca Division of Bengal.

	Percentage of Villages Attacked.		Mortality in 1884.		Difference in 1884 in Death-Rates as compared with—		Unhealthy Months.
	In 1884.	Excess or deficit as compared with 1883.	Number of deaths.	Ratio per mille.	1883.	1879-83.

Total ...	23·15	10·95 *I*	32,074	3·68	2·23 *I*	2·18 *I*	January to May, October to December.

These figures indicate that in this division Cholera invaded a much larger area and caused considerably higher mortality, the Faridpore district mainly contributing to the increment. The worst months were January to May and October to December.

65. *Dacca.*—Cholera prevailed in this district with greatly enhanced severity in comparison not only with the preceding year, but also with the preceding seven years. It carried off 3·85 per 1,000 of the population from 26·73 per cent. of the villages, which exceeds the mortality of 1883 by 2·82 per 1,000, and of the lustrum 1879-83 by very nearly the same proportion. Its seasonal incidence corresponded with that of former years. It was severe in December 1883, and abating somewhat through January and February of the year under report, again increased in March and attained maximum intensity in April. In May it declined very sensibly, and during the next four rainy months it was practically extinct. In October it resumed activity and continued so till the end of the year, exhibiting in November a death-rate almost equal to that of April. A variation in the course followed by the disease was observed in the Dacca town, as July, August and September (months usually free from Cholera) were also very unhealthy. The same was the case in 1882, and it is remarked that "both years were characterised by the lowness of the inundation, high flooding of the country being incompatible with Cholera epidemics." The circles named in the margin returned the highest death-rates. The outbreaks of Cholera in the Munshiganj and Manikganj sub-divisions (thanahs Munshiganj, Manikganj, Jafferganj, and Harirampur) are referred to want of good drinking-water, the reservoirs having become stagnant and foul from rotten vegetation, which could not be washed away, as the country was not under water as in former years owing to deficient rainfall. Moreover, in the latter sub-division the silting up of the rivers interferes with its natural drainage. The Collector of Dacca observed during his tour that in thanah Harirampur, that even in August, when the water was at its height, it stunk and seemed unfit for drinking purposes directly the khal is passed, and that in the dry months the condition of the khal itself is the same. He therefore does not consider it surprising that Cholera breaks out very severely in this thanah. It was noted that, while Cholera was at its height in the Munshiganj thanah from October to December, at the Kartick Baroni mêla, held in that thanah from the middle of November to the end of December, and which was thronged with people from the neighbouring villages with a very large number of boats lying alongside and plying up and down the river, only five cases of cholera, four ending fatally, occurred, although during its height a severe epidemic of the disease existed in a large village less than a mile from it, and ten deaths occurred in two days in another village two miles distant in the middle of December. The mortality from cholera in the Dacca town had risen from ·59 per 1,000 of population in 1883 to so high as 2·88 per 1,000 this year, indicating that a good partial water-supply (although it confers great benefit) is not itself sufficient to arrest the inroads of the disease, for the sanitary condition of this town is in several other respects anything but satisfactory. The drainage is very defective. There is an absence of all natural drainage. The levels of the streets and lanes are very irregular, and the court-yards of houses are, as a rule, a foot or more below the level of the roads and lanes, precluding house-drain connection with the main drains. The night-soil and scavenging establishments are below the requirements of so large, so dirty, and so irregularly built a town as Dacca. It has not yet been provided with a sufficient number of public latrines, and, worse than all, many "Gors," well-privies, and contaminated wells yet exist. It is a significant fact that no cases of Cholera occurred among Europeans in this town since 1878 (particularly during the severe outbreak of 1882, when every native who could fled from the town), but that prior to 1878 one or two cases occurred among them annually. The facts associated with this immunity are that the new water-supply was introduced in May 1877, and that the Europeans are more careful as to the character of their drinking-water than the Natives. A case in point, illustrating the utter indifference evinced by Natives with regard to drinking-water, is that after an ineffectual attempt on the part of the Civil Surgeon to have a favourite well, containing 49 per cent. of previous sewage contamination, closed, its water was conveyed to a new tank close by. It is found hard to get the native members of the Municipality to believe that well-water in Dacca is only diluted sewage.

66. *Faridpur.*—Cholera prevailed very severely and fatally in Faridpur. It stands third on the list of cholera-stricken districts. The extent of country pervaded by the disease was much larger, and the mortality caused by it considerably greater as compared both with 1883 and the quinquennium 1879-83. The death-rate was 5·34 per 1,000 of population in 29·53 per cent. of the villages, as opposed to 1·27 per 1,000 in 12·30 per cent. during the preceding year, and 1·79 per 1,000 during 1879-83. The Cholera of January and February was a continuation of the outbreak of the past year. There was an aggravation in March, which culminated in severity in April involving the whole district. After this there was a gradual abatement till October, from which month the severity of the disease progressed in intensity, and spread to every thanah in the district, excepting Humdumpur, November being the worst month during this period. Every circle in the district exhibited high death-rates. They are named in the margin in the order of suffering. The town of Faridpur, which had hitherto been comparatively free from cholera, had a severe outbreak during the fourth quarter of the year. The following summary of facts connected with this outbreak, recorded by the Civil Surgeon, may be found interesting:—

	Ratio per *mille.*		Ratio per *mille.*

"(*a*). Those cases which occurred in the town were in the persons of those who had nothing to do with any previous case of cholera. (*b*) On an average about eight persons attended on each of the cases including medical attendants, relatives, friends and servants, and none of them got an attack of the disease. (*c*) Nervousness or fear had not any marked influence in producing the disease. (*d*) Cholera cases occurred among people of all classes and living in different sections of the town and who use water from different sources, some from tanks, and others from the khals, &c. (*e*) The largest number of cases occurred in places that are low and damp, and hedged in by trees, and are ill-ventilated and dirty. (*f*) Several cases occurred in or about the houses where cases also occurred in 1882. (*g*) Although the disease prevailed so severely in the town, yet the villages situated within a mile or two from it remained almost free, though they had to get their supplies of provisions from the infected bazar. (*h*) The jail, situated in ward No. 3, having an average population of nearly 260 persons, remained altogether free from the disease, though cases occurred within a few hundred yards from the garden, and prisoners were admitted into the jail from infected thanahs of the district, and had to undergo mental troubles, physical labour, long journeys with insufficient food; and that many of them were in indifferent and bad health, and suffered from bowel-complaints. (*i*) Most of the cases were males, and only a few were boys. (*j*) The cases which took place in the beginning, and those which took place towards the end of the outbreak, differed in nature; the former were sudden, sharp and severe; the latter were milder and more prolonged; and in some of them all the symptoms were not present, and death took place 48 or 60 or more hours after." The disease also prevailed with great severity in the Madaripur town, and spread rapidly to the villages adjoining the Palang police station, and in Amgram in thanah Madaripur. The unusual virulence of the disease is referred to the drinking water in these localities, which is deficient and bad, the early cessation of the rains having caused the tanks to dry up prematurely, and in some places to leave the people nothing to drink, except the bhil water, in which jute had been steeped. The rivers were also below their normal level

67. *Backergunge.*—In this district also the disease was more widespread and fatal than in the preceding year. 34·50 per cent. of the villages, or 8·19 per cent. in excess, were attacked, and the mortality amounted to 4·63 per 1,000 of population, being 2·23 per 1,000 above the rate of 1883 and 2·53 per 1,000 above that of the lustrum 1879-83. The cold and hot months of January to May, and October to December were the worst, and the intervening rainy months the contrary. This fact has been frequently observed, the only reason assigned for it being "that in the absence of rain and during the falling of the sub-soil

water the general causes of cholera are more concentrated." The mortality was noticeably severe in all the circles, excepting Barhanadi,—*vide* marginal figures. The Civil Surgeon observes that it is noteworthy, as illustrating the fact that there is a close relation between the prevalence of cholera and insanitary conditions that the comparison between the prevalence of the disease in the Jhalokati and Perozepore town is very marked. The former, in which sanitation is lamentably deficient, suffered severely; while the latter, only 18 miles off, the sanitary condition of which is good, enjoyed great immunity from the disease. But this observation, he states, does not apply to rural areas, the sanitary conditions of which are well-nigh similar, or in other words more or less objectionable.

68. *Mymensing.*—In this district the disease did not exhibit any marked advance either in extension or severity, and the mortality was on the whole low. The death-rate stood at 2·08 per 1,000 of population in 13·31 per cent. of the villages against 1·26 per 1,000 in 9 per cent. Nevertheless, the mortality in the circles named in the margin was noticeably great. The Civil Surgeon observes that, contrary to the experience of former years, there was comparatively less cholera present in the district during the first quarter of the year. During this period there fell only 6·64 (? 3·63) inches of rain. Coincident with the increase of rain (6·01 inches) in April there was a sudden rise in the severity of the disease throughout the district, which progressed in intensity up to June. During July to September, when the country was flooded, a marked decline occurred; but during the last quarter, with the subsidence of the floods, the incidence of the disease was very severe, particularly in November and December. It was during this period that the bulk of the high mortality in Pingna thanah occurred.

Cholera prevalence in the Chittagong Division.

69. The Cholera statistics of this Division are subjoined:—

	Districts.	Percentages of Villages attacked.		Mortality in 1884.		Difference in 1884 in Death-rates compared with—		Unhealthy Months.
		In 1884.	Excess or deficit as compared with 1883.	Number of deaths.	Ratio per *mille*.	1883.	1879-83.	
Eastern Districts. *Chittagong Division.*	Chittagong ...	15·03	10·46 *I*	1,264	1·09	·80 *I*	·17 *D*	May to July, November and December.
	Noakhalli ...	13·51	11·69 *I*	1,374	1·67	1·57 *I*	1·42 *I*	August and September, November and December.
	Tipperah ...	11·67	3·86 *I*	3,051	2·00	·40 *I*	·86 *I*	January to May and October to December.
	Total ...	12·56	6·62 *I*	5,689	1·63	·81 *I*	·66 *I*	April, May, August, September, November and December.

On the whole, the prevalence of Cholera in the Chittagong Division of Bengal was not excessive, although the disease extended over 6·62 per cent. of additional villages, and the mortality was higher by ·81 per 1,000 of population as compared with 1883, and ·66 per 1,000 with the quinquennium 1879-83. The most unhealthy months were April, May, August, September, November and December. This differs to some extent in comparison with the other Divisions in Bengal Proper, from causes which will be apparent presently.

70. *Chittagong.*—In this district cholera extended over a much larger area, represented by 10·46 per cent. of additional villages; but the mortality was not relatively as great, being only ·80 per 1,000 of population in excess. In

comparison with the lustrum 1879-83, a decrease in the death-rate of ·17 per 1,000 is seen. On the whole, however, the suffering was not very great, as only 1·09 per 1,000 of the population died of the disease, and conspicuously high mortality was returned by only the Chittagong town (5·01 per 1,000) and the rural circles of Chakariya (2·93 per 1,000), Banskhali (2·44 per 1,000) and Teknaf (1·86 per 1,000). A noticeable feature connected with the prevalence of the disease this year was that immediately after the occurrence of a violent storm, of a cyclonic character, early in November, it raged with great severity, commencing in the town of Chittagong and becoming general over the district, with added virulence during December. The Mirserai and Kumuria circles, however, escaped this visitation of the disease in its severe aspect. The former thanah also enjoyed immunity from it during 1880 to 1883. In this outbreak a very large quantity of rubbish from the homesteads in the town of Chittagong, which otherwise could not have been got at, was swept out, collected on the roadsides and burnt, sulphur being freely used in these fires. The people willingly assisted in carrying out this measure, going to the length of purchasing sulphur and burning it for themselves. Thus one source of insanitation which could not be removed, either with money or by the spontaneous action of the people, was got rid of from this notoriously unhealthy town.

71. *Noakhulli.*—The mortality from Cholera in this district (1·67 per 1,000 of population), although not excessively high, exceeded that of 1883 by 1·57 per 1,000, and that of the lustrum 1879-83 by 1·42 per 1,000. The circles named in the margin returned the highest death-rates. The disease manifested severity in July, and, prevailing with added vigour in August, attained maximum intensity in September. It subsided markedly in October, but became active again during November and December. A very severe outbreak of the disease occurred in the Sudharam town, which commenced in August and ended in October. It was not confined to any particular locality, but was scattered over different parts, cases occurring at irregular intervals and, according to the Magistrate, seldom attacking more than one homestead in the same locality, stopping for a few days, and re-appearing with re-doubled force. Another curious feature of the disease was that it was confined to the Hindus, as only two or three Mussulmans suffered. It appeared first in the house of Dr. Juggut Bundhu Gangooly, after his return from Begumgungo where he had been to treat a cholera patient, and the first victims were his three little daughters. Prior to the period when the disease raged, the rainfall was the smallest as compared with corresponding periods of several previous years; but on the occurrence, on the 1st of November, of a furious storm, accompanied by heavy rain (8·90 inches in 10 hours), the disease disappeared. This, it will be observed, is contrary to the experience in the Chittagong town, where the same storm is said to have caused a very severe outbreak of the disease. The Assistant Surgeon in charge, Anund Chundra Mukerjee, visited many of the affected localities, and found their sanitary condition very bad. The houses were damp and their surroundings filthy, and the neighbouring drains were offensive and contained in many places stagnant and foul water "lined with patches of scum in which myriads of minute organisms propagated, developed, and thrived luxuriantly." With reference to an outbreak which occurred in certain villages in Chhagulnaia thanah, the Assistant Surgeon remarks that, "importation of the disease was distinctly traceable in every village where the disease appeared. Men from several villages went to collect thatching grass from the hill sides belonging to the Maharajah, and there many of them contracted the disease and some died, and many of them who returned apparently well, were infected with the poison. The first house in the village where cholera broke out was invariably the house to which a sick or infected man had returned, or the body of a cholera patient was carried. Generally, the largest number of deaths from the disease occurred only in the families wherein the seed of the disease was introduced directly from the infected hills. * * * * The disease, when it first made its appearance, did not show a tendency to spread widely: in a village scarcely more than two houses contracted the malady

	Ratio per *mille.*
Ramganj thanah	5·06
Sudharam town	4·29
Begamganj thanah	3·24
Lakshampur „	2·85

from the one where it first showed itself. A house in each village formed a distinct centre where the disease was originally carried by importation. Haripur is a big village. The main road from the sub-division to Chhagulnaia divides it into two parts. The part of the village on the northern side of the road where there was no introduction of the seed of cholera by importation remained perfectly free from the disease, whereas that portion of it on the southern side where a person returned from the infected place suffered from the malady." The above localities are in a very insanitary condition. The water-supply is bad, several of the deep tanks being in a foul state from ingrowth of rotten vegetation. Putrid cow-dung is heaped up near dwelling-houses. The dead are buried on the banks of the drinking water tanks. The Noakhali jail, with its superior sanitary arrangements, enjoyed perfect immunity, although surrounded by the disease. In addition to the usual measures adopted to arrest the progress of the disease were the strict prohibition of throwing the dead bodies of cholera subjects into the khals, and the proper disposal of cholera vomit and excreta and the clothing and bedding of cholera patients.

72. *Tipperah.*—In this district 2 per 1,000 of the population died from Cholera in 11·67 per cent. of the villages, as opposed to 1·60 per 1,000 in 7·81 per cent. of the villages in 1883, indicating an increase in both the extension and fatality of the disease. The circles named in the margin experienced the highest suffering.

Hajiganj " ...	1·95

The cholera of November 1883 continued to prevail until May of the year under review, when it began to subside gradually with the setting in of the rains ; but in September it became again active and increasing in vigour, culminated in severity in December. In some parts of the district, however, particularly in Daudkandi and Hajiganj, there was a sudden rise in mortality after a storm which swept over the district on the 1st of November. Here, it will be observed, the effect of the storm was the same as in Chittagong. Referring to the causation of the disease, Dr. ffrench-Mullen, the Civil Medical Officer, says :—"It was noticed that the fields dried up with unusual quickness after the rains this year. This no doubt tainted the atmosphere on account of the rapidity of the evaporation. The water holes in which the people are accustomed to steep jute dried up in many cases so that the tanks used for drinking purposes were used to steep their jute. It is popularly thought that the decomposition of the cast-off portions of the jute makes the surrounding atmosphere unhealthy, and this predisposes the inhabitants to cholera." It is, moreover, said that the villagers have recourse during the prevalence of cholera to religious ceremonies to avert the ravages of the disease, instead of attending to the sanitation of their villages. An outbreak of the disease which occurred in the town of Comillah, was observed to have been entirely confined to the thickly-populated native quarters and to its outskirts. A smart outbreak occurred in the town of Brahmanberiah. This town is in an extremely insanitary condition. The drainage is very defective, all the drains being kutcha and out of level, causing the accumulation in places of stagnant water. It is the general practice for the people to use the drains as latrines in which the night-soil lies and festers. Interments are carried on in the compounds of dwelling-houses. The Deputy Superintendent of Vaccination, Eastern Bengal Circle, who visited this town, supports the above description of its insanitary condition.

BEHAR.

73. In this Division of the Province 17,686 deaths were reported to have occurred from Cholera among its population, numbering 23,127,104, yielding a death-rate of ·76 per 1,000. This occurred in 4·83 per cent. of the villages. The corresponding figures of 1883, and the quinquennium 1879-83 are furnished in the margin. The comparison indicates a slight extension of the disease with a large reduction in mortality. The suffering in Behar is found to have been considerably less than

Cholera prevalence in the Behar Division of the Province.

Total	3·99	2·62 *D*	10,410	·69	·93 *D*	1·17 *D*	July and August.

In the western portion of Behar there was, on the whole, much reduction in the extent of country pervaded by the disease, as well as in mortality. This decrement is represented, with regard to area attacked by 2·62 per cent. of the villages, and to mortality by ·93 per 1,000 of population in comparison with 1883, and 1·17 per 1,000 in comparison with the lustrum 1879-83. July and August exhibited the largest number of deaths.

75. *Patna.*—In this district Cholera prevailed more extensively and with greater fatality than in 1883, but was not excessively severe. The death-rate stood at 2·02 per 1,000 of population in 11·53 per cent. of the villages, the increment over 1883 being ·74 per mille and over the average of 1879-83, ·39 per mille. The circles indicated marginally returned the highest death-rates.

Patna thanah ...	6·14	Silao thanah ...	3·53
Behar town ...	4·92	Massauri „ ...	2·76
Dinapore thanah ...	4·48	Maner „ ...	2·61

The seasonal activity of the disease commenced in April and steadily increasing month by month, culminated in severity in August. It was also active during September, but the remaining months were months of great immunity, January and February exhibiting no deaths. Of local outbreaks, a very severe one occurred in village Koormee Chuck in which 60 persons were attacked, of whom 30 died. This village is reported to be thickly populated and its water-supply " abominably bad." It was ascertained that at the time of the outbreak the people used to drink the water of a stagnant pool contaminated with all descriptions of organic matter. On abandoning this water and taking to the well in the village, " the virulence of the epidemic subsided, and the disease gradually disappeared in a very short time." Another outbreak, in epidemic form, prevailed in some villages in the Dinapore sub-division from the middle of April to the end of October. Referring to it, the Sub-divisional Officer writes :—" The most remarkable point in regard to the outbreak is that the disease broke out in places where cleanliness was very rigidly observed ; while, on the other hand, villages which were, as far as outward appearance went, in a filthy state, escaped the epidemic altogether." This outbreak also affected the Regiment in the Cantonment of Dinapore. The troops were sent to the Maner encamping ground and no fresh cases occurred among them during the three weeks they were encamped, but the disease broke out in a virulent form in the adjacent villages.

76. *Gya.*—In this district the high suffering of 1883 abated very considerably during the year under review. The mortality amounted to only ·95 per 1,000 of population against 3·73 per 1,000, and the percentage of villages attacked was 4·44 against 8·88, showing a decrease in death-rate of so much as 2·78 per 1,000 and an escape of half the number of villages which were overrun by the disease in 1883. July, August and September were the

most unhealthy months, particularly August. Only in the town of Gya (4·72 per 1,000) and in the rural circles of Nabinagar (2·53 per 1,000) and Attri (1·14 per 1,000) conspicuously high death-rates occurred. The Sub-divisional Officer of Aurungabad reported that cholera of a virulent type prevailed in villages Chundergurh, Nabinagar and Jhari. These localities have the reputation of being the most unhealthy in the sub-division; but importation of the disease from the adjacent district of Shahabad is also quoted as helping its spread. A rather serious outbreak occurred in the Rajauli town in August. The water-supply of this town is suspected to be bad. Fifty-eight deaths from cholera were stated to have occurred among the pilgrims who passed through this district.

77. *Shahabad.*—In this district also the severity of the disease had considerably abated. In fact there was less of it than during the preceding eight years, 1877 and 1880 excepted. The death-rate during the year under review amounted to ·90 per 1,000 of population in 4·53 per cent. of the villages, against 3·24 per 1,000 in 11·77 per cent. of the villages in 1883. Compared with the average death-rate of 1879-83, the large reduction of 4·13 per 1,000 is seen. There were no deaths during the first two months of the year, and in March only two casualties occurred, but from April the severity of the disease increased and progressed until September, when it commenced to decline very sensibly, December returning only four deaths. The town of Sasseram appears to have been remarkably free from the disease, with only one fatal result. It might be recorded here that the Sub-divisional Officer of Sasseram is of opinion that the entire absence of cholera during the year from this town is attributable to the improved quality of the water in Sher Shah's tank since it was provided with an inlet to receive canal water and an outlet to keep it flowing.

78. *Mozufferpore and Durbhunga.*—The extension and fatality of Cholera in these districts had declined more tangibly than in the other districts in West Behar, which enjoyed immunity from it. The death-rate in the former was only ·12 per 1,000 of population, and in the latter ·28 per 1,000 against 1·32 and 1·05 per 1,000, respectively, in the preceding year. In no areas in these districts was the mortality noticeably high. There is nothing further to record regarding cholera in Mozufferpore, and the only noteworthy points in connection with its prevalence in Durbhanga submitted by the local officers are the following. The Civil Surgeon says that the only peculiarity in its prevalence was that the last quarter of the year was marked by the rather unusual occurrences (for the time of the year) of simultaneous outbreaks in various parts of the district; but although spread over a pretty large area, the type of the disease was mild and not very fatal. The Sub-divisional Officer of Beniputti notes that in Beniputti thanah and in the adjacent villages cholera prevailed epidemically, but disappeared with the setting in of the winter. This is opposed to the Civil Surgeon's observations.

79. *Sarun.*—The mortality from Cholera in this district was somewhat greater than in 1883, the death-rate amounting to ·58 per 1,000 of the population in 4·74 per cent. of the villages, as opposed to ·48 per 1,000 in 4·01 per cent. of the villages; but these figures also indicate that the suffering was not great. Noticeably high mortality occurred in only the Sarun town, which returned a death-rate of 2·47 per 1,000 of population. No particulars have been furnished with regard to the prevalence of the disease in this town.

80. *Chumparun.*—This district also did not experience any severe suffering from the disease, the death-rate amounting to only ·37 per 1,000 of population, against ·30 per 1,000 in 1883, and the percentage of villages attacked being ·99 against 1·00. August was the worst month, in which the deaths rose to 416 from 24 during the preceding month. It was observed that the Hardi thanah, which is the most unhealthy, and lies in great part between the Bagaha and Bettiah thanahs where cholera was present, was not affected, and that similarly Govindgunj and Adapore, which, although surrounded with cholera-affected localities, viz., by Bettiah, Motihari, Kasariya and Dhaka, escaped.

81. In the following table are exhibited the statistics indicating the extent of prevalence and fatality of Cholera in East Behar :—

Cholera prevalence in East Behar.

Districts.		Percentages of Villages attacked.		Mortality in 1884.		Difference in 1884 in death-rates as compared with—		Unhealthy Months.
		In 1884.	Excess or deficit as compared with 1883.	Number of deaths.	Ratio per *mille.*	1883.	1879-83.	
East Behar.	Monghyr	8·01	5·50 *I*	1,381	·70	·26 *I*	·78 *D*	June to August.
	Bhagulpore	10·90	9·06 *I*	1,604	·81	·56 *I*	·61 *D*	May to August.
	Purneah	1·53	·55 *I*	417	·22	·04 *I*	1·26 *D*	April.
	Maldah	7·68	·41 *D*	1,158	1·62	·15 *I*	·26 *I*	April to June and December.
	Sonthal Pergunnahs	5·30	4·49 *I*	2,716	1·73	1·50 *I*	1·14 *I*	April to August.
	Total ...	6·21	4·06 *I*	7,276	·90	·51 *I*	·38 *D*	May to August.

These figures indicate that, on the whole, while the disease was not widespread in East Behar, it invaded 4·06 per cent. of the villages in excess of the percentage of 1883, associated with an increase of mortality to the extent of ·51 per 1,000 of population; that in comparison with the quinquennium, 1879-83, a reduction in death-rate is seen, amounting to ·38 per 1,000; and that the unhealthy months were May to August.

82. *Monghyr.*—In this district the disease did not prevail extensively or very fatally. There was, however, an increase, in comparison with 1883, in the proportion of villages traversed by the disease of 5·50 per cent. and of mortality to the extent of ·26 per 1,000 of population. June to August were, as usual, the unhealthiest months, and the circles named in the margin suffered the most. The local reports do not furnish any information accounting for the high death-rates in these circles.

	Ratio per *mille.*
Jamalpore town	5·01
Monghyr "	2·71
Chakai thanah	2·63

83. *Bhagulpore.*—In this district, although there was more Cholera, the mortality was very low, amounting to ·81 per 1,000 of population in 10·90 per cent. of the villages as opposed to ·25 per 1,000 in 1·84 per cent. of the villages. The months of preponderating suffering were May to August, but only the Bhagulpore town returned a noticeable high death-rate, viz. 4·68 per 1,000 of population. No explanation has been furnished regarding the prevalence of the disease in this town, but in Banka, where 1·85 per 1,000 of the population died, the unhealthiness is attributed to local insanitary conditions and to the people being compelled to live on inferior food, owing to the high prices for the ordinary food grains caused by failure of crops.

84. *Purneah.*—This district enjoyed great freedom from the disease, the death-rate amounting to only ·22 per 1,000 of population in 1·53 per cent. of the villages. Most of the cholera cases occurred in the south of the district, and while in no circle the mortality was heavy, in the Purneah, Gondwara, Matiari and Raniganj thanahs no deaths occurred.

85. *Maldah.*—In this district, while the disease prevailed less extensively, the mortality was slightly higher as compared with the preceding year. The mortuary figures represent a death-rate of 1·62 per 1,000 of population against 1·47 per 1,000, and percentages of villages attacked 7·68 against 8·09 in 1883. The seasonal severity of the disease in Maldah was different from the rest of the districts in Behar and corresponded more with that of those in Lower Bengal, inasmuch as April to June and December were the unhealthiest months. The highest death-rates were returned by the circles named in the margin. The Magistrate refers the severity of the disease to insufficient inundation, insanitary habits of the people, and want of good drinking water in many places during

	Ratio per *mille.*
English Bazar town ...	6·11
Ratua thanah ...	2·77
Nawabganj " ...	2·73
English Bazar " ...	2·02

the hot weather. To these causes the Civil Surgeon adds sleeping on damp floors and fouling of the river banks with human excreta, and further on in his report, he says:—"The healthy are crowded with the sick. The evacuations are thrown recklessly out of doors, with no pretence of disinfection, and thereby become hot-beds for the manufacture of new cases. The clothing worn by the patients and soiled with their emanations is allowed to remain, and the people refuse to destroy it, and the bodies of people dying of cholera are thrown, without proper burning, into the river, the chief supply of drinking water. In some cases I have seen cholera stools kept in a vessel in the hut where the patient and several other members of the family were herded together, eating, drinking, sleeping all together, and all the while inhaling air poisoned with putrifying cholera stools." He suggests that the people should be compelled by law to observe sanitary precautions, as otherwise cholera must continue to be present permanently in their midst.

86. *Sonthal Pergunnahs.*—Cholera prevailed in this district much more extensively and with considerably enhanced severity as compared with the preceding year. 5·30 per cent. of the villages were overrun by the disease against ·81 per cent., and the death-rate stood at 1·73 per 1,000 of population against ·23 per 1,000 in 1883. April to July were the months of greatest prevalence, particularly May, and the circles named in the margin suffered the most. The relation indicated below between the increase and decrease of cholera on the one hand, and the increase and decrease of temperature, rainfall, and depth of sub-soil water level on the other hand is remarkable for Behar, and is more in accord with the behaviour of the disease in Lower Bengal. The disease while present in some part of the district or other throughout the year, commenced to prevail with some severity from March and attained maximum intensity in May. It exhibited somewhat mitigated severity during the following two months, and then rapidly declined until the end of the year. During January and February, when the temperature was low and there were slight showers of rain, the district was comparatively free from cholera, during March, when the temperature advanced by several degrees and there was absolutely no rain, the disease gained fresh strength and commenced spreading. During April, when the heat was still greater and very little rain fell, the disease become more wide-spread and prevailed with added virulence in the localities before attacked. In May, when the highest temperature was recorded and the little rain which fell amounted to only 1·02 inches and was distributed over 8 days, the disease attained maximum intensity in all the places where it was prevailing, and attacked new areas. From June, when the temperature fell and rainfall increased and the sub-soil water began to rise, the disease gradually declined in severity, and disappeared from locality after locality until December, when it prevailed with subdued intensity in only the town of Sahebgunge and in a few places in the subdivisions of Dumka and Godda. Most of the local outbreaks of the disease were severe, and the worst of them are cited below. In an outbreak which occurred in the bazar in the town of Dumka, 52 were attacked, of whom 38 died. This outbreak spread to the neighbouring villages, and thence to other villages in the subdivision of Dumka, attacking in all 81 villages, and causing 230 deaths. It was of a very virulent type with little or no vomiting and proved fatal within 24 hours. In the lowlying tracts in the subdivision of Rajmehal the disease prevailed very generally, affecting 110 villages, and exhibiting 370 fatal results. A severe and exceptionally fatal outbreak occurred in the Pakour subdivision. It first appeared in villages Mohespur and Aludanga, and from these villages it spread rapidly to 131 other villages, and in the five months during which it lasted caused 651 deaths. The disease prevailed with great severity in the subdivision of Deoghur, including Jamtara. It appeared in village Rohini in thanna Deoghur, soon affected the neighbouring villages, and continued to spread to other villages with unabated vigour during five months, and attacked in all 866 persons and killed 706 in 363 villages. It behaved similarly in thannah Madhupore, where 130 persons fell victims to it in 39 villages. In 35 villages in Jamtara 118 persons died. In the Godda subdivision 451 persons were attacked in 80 villages, of whom 355 died.

Total ...	20·86	12 60 *I*	17,983	4·95	3·13 *I*	1·98 *I*	April to July and November.

The prevalence and fatality of Cholera in Orissa were, it appears from the above figures, excessively severe, considerably more severe than in the other three divisions of the Province. Every circle in the three districts which compose it exhibited high mortality. On the whole, 17,983 persons out of a population of 3,628,832, or at the rate of 4·95 per 1,000, fell victims to the disease in 20·86 per cent. of the villages, against 6,631 persons, or at 1·82 per 1,000 in 8·26 per cent. of the villages during the preceding year, and 10,797 persons, or at 2·97 per 1,000 in 14·69 per cent. of the villages during the quinquennium 1879-83.

Diagram illustrating the seasonal prevalence of Cholera in Orissa and Bengal.

88. The annexed diagram illustrates the seasonal prevalence of Cholera in the Orissa Division of the Province during the five years 1880 to 1884 as contrasted with its seasonal incidence in Lower Bengal.

Results deduced from the Diagram.

89. The following results are presented by this Diagram.

1880. *Orissa.*—The mortality was very low in January, increased considerably in February, still more so in March, declined through April to June, steadily rose from July to the end of the year, being comparatively severe in November and attaining maximum intensity in December. *Bengal.*—The severity of the disease was greatest in January, after which there was a decline which lasted up to October, February to May being months of comparatively much suffering and June to October of great freedom. In November there was a sudden rise of mortality, which made December as unhealthy as March.

1881. *Orissa.*—The first month of this year ushered in much mortality from cholera, which, however, diminished in February to increase considerably in March, and to attain maximum intensity in April. The cholera of May and June was less fatal; but July exhibited great mortality, which, however, declined through August to December with varying incidence. *Bengal.*—There was much cholera in January. In February there was a reduction followed by considerable increase in March and April, the latter month being the unhealthiest. May exhibited a larger number of casualties than March, but in June the severity of the disease diminished greatly, and this abatement continued with fluctuations until September, but gave place to high mortality in October to December, particularly during the last-named month.

1882. *Orissa.*—January and February were months of low mortality. From March it increased considerably and progressively up to May, which exhibited maximum severity. June and July were also months of great suffering, but August to November experienced subdued severity, which yielded to high mortality in December. *Bengal.*—Here cholera prevailed with much severity during the first five months of the year. From June to September there was a progessive reduction of fatal results, but in October there occurred considerable increase of mortality, which lasted through November to December, the last-named month being the unhealthiest.

1883. *Orissa.*—January was the most sickly month. February was less unhealthy and was followed by progressive subsidence of mortality up to June with slight exacerbation in March; but in July the death-rate rose suddenly. During August to December there was again a progressive decline of mortality, December being the healthiest month. *Bengal.*—January took the lead in the production of fatal results. February was considerably healthier, but in March the disease resumed activity, and in April it was almost as fatal as in January. In May the suffering was slightly less than in April. From June, however, the incidence of the disease subsided very considerably month by month up to September. In October there was a rise in mortality which continued through November to December, which was nearly as unhealthy as January.

1884. *Orissa.*—January, February and March were comparatively healthy months. In April there was a considerable rise of mortality, which continuing through May culminated in severity in June. The casualties in July were slightly smaller than in June, but fell considerably in August to increase again from September to the end of the year with varying incidence. *Bengal.*—The mortality was not very great in January and February, but in March there was a considerable increase, which rose in April to an unprecedentedly high proportion. In May there was a very marked reduction of fatal results, which abatement was still progressively greater up to September; but in October the disease resumed activity, and was very severe in November and December.

90. The table in the margin exhibits the mean mortality from Cholera in Orissa and in Bengal during the quinquennium 1880 to 1884, of which the details have been furnished above. It will be seen from it that, on the whole, the months of predominating mortality are April to July in Orissa, and March to May and December in Lower Bengal. How far the presence of pilgrims affects the seasonal prevalence of Cholera in Orissa will be shown when dealing with the history of the disease in Poori, to which district the main body of the pilgrims converge.

91. *Cuttack.*—This district did not enjoy in the year under review the immunity from Cholera which characterised its incidence during the preceding year. On the contrary, the disease spread over a considerably larger tract of the district, and the mortality was very much higher, as the following figures show. The proportion of villages attacked was 22·75 per cent. against only 7·32 per cent., and the mortality stood at 4·16 per 1,000 of population against only 1·95 per 1,000. Moreover, the casualty rate of this year exceeded also that of the lustrum 1879-83 by 1·63 per 1,000 of population, and was also greater than during any individual year of this quinquennium. Of the 13 circles in the district, in not one was the mortality so low as to indicate that the incidence of the disease was not severe in it, as will be seen from the figures in the margin. January and February were months of low suffering. In March the disease became active and gradually increased in severity up to July. In August there was some abatement followed by increased severity month by month till it attained maximum intensity in November; but December was also an unhealthy month. It will be noticed that the disease clung to the district persistently throughout the year. This is, it is said, contrary to the experience of former years, when it appeared at certain times in

epidemic form, and was often entirely absent. Excepting Jaggatsingpur, where the disease was most prevalent, it affected chiefly places through which the bulk of the pilgrims pass, such as Patamundi, Aul, Kendrapara, Jajpur, Salepur, and Dharmsala. The Superintendent of Vaccination of the Orissa Circle, who visited the Jaggatsingpur thanah, while the disease was present in it in November, attributes its prevalence chiefly to the eating of semi-cooked food at irregular hours, to the insanitary condition of the dwellings, filth of all descriptions in a putrid state lying in front of every door, and to bad water-supply, drinking water being taken from tanks rendered impure from promiscuous use and from wells unprotected from pollution. Pilgrims are not permitted to enter Cuttack town, but are made to pass by a road beyond its limits, recrossing the Mahanuddi river by a ferry below the anicut. Nevertheless, the mortality in this town was not inconsiderable. There are charitable dispensaries along the pilgrim route at Cuttack, Jajpur, Kendrapara and Dharmasala as well as lodging-houses to afford shelter.

Considering that this town is subject to an annually recurring high mortality from cholera and that the water-supply from the surface wells is bad, the necessity for good water is strongly indicated as an essential for the maintenance of health calling for early attention. As the river has already been dammed and converted into a great lake, a complete water-supply scheme for the town appears to be a matter of easy solution at a moderate cost. A scheme for the supply of filtered water to the town from the river was under consideration and a survey proposed, but no further action appears to have been taken in the matter.

92. *Poori.*—In this district also the disease prevailed with considerable severity, but at a more subdued rate than at Cuttack and Balasore. Nevertheless, the suffering was greater than during the past 5 years, excepting 1882. The mortality amounted to 3·52 per 1,000 of population in 13·70 per cent. of the villages, against 1·26 per 1,000 in 6·07 per cent during the preceding year, and 2·52 per 1,000 during the quinquennium 1879-83. Every circle in the district exhibited conspicuously high death-rates, as will be shown presently. Up to May the prevalence of the disease was not great in the district, but a sudden rise took place in June, and in July the disease attained maximum height. In August there was some abatement, which was followed by a progressive increase up to December, November being the next most unhealthy month to July and December to November. In the town of Poori, however, the maximum was reached in June. But this great rise in mortality, in fact the great fatality of the disease in this town, represented by a death-rate for the year of 13·51 per 1,000 of population, the highest of any of the circles, must not be taken as absolutely belonging to it, for it is calculated on the census population, which does not include the large floating population of pilgrims numbering from 30,000 to 60,000 who assemble here at times of festivals, some of which last about a fortnight. Such an influx of exhausted travellers, many of them from distant parts of India, and infirm, sickly, and well advanced in years, must necessarily be followed by a heavy death-rate not only from cholera but also from other diseases. In December this town was free from cholera, and this immunity Mr. Lyons, the Civil Medical officer, says is explained by the dispersion in the previous month of the pilgrims who had congregated in the town for the Panchuk festival. The rural circles exhibited considerably lower death-rates than that of the town, *viz.* Poori 4·84 per 1,000 of population, Pipli 4·01 per 1,000, Gope 2·26 per 1,000, Bhanpur 2·09 per 1,000, and Khurda 2·04 per 1,000. Poori, Pipli, and Khurda form the centres of the pilgrim streams, and Gope and Bhanpur are on the pilgrimage line. Mr. Lyons points out that the periods of fatality in these circles more or less correspond in time when the last two of the three great festivals are held, *viz.* the Ruth jattra commencing on the 25th June and ending on the 10th July and the Panchuk jattra commencing on the 30th October and lasting to the 3rd November. His views on the connection of cholera with the festivals are expressed in the following words: "There is a sameness so recurring that, whatever the theories may be of its causation, whether induced by the impurity of drinking-water, solar or atmospheric conditions, &c., there is little room for

doubt as to its communicability and dissemination by human agency, also that it impresses most where persons congregate most, and this the large halting grounds in this district bring out pretty clearly, cholera making its march on, and retreat from these with great distinctness; Khorda, Pipli (Satyabadi), and Poori town, as the centres on which the pilgrim streams converge, suffering the most." He submits the following account of the outbreak of the disease in the Poori town in support of the above views. The first case of cholera in the town occurred on the 21st June, when a large number of pilgrims had come into it for the celebration of the Ruth jatra. It assumed epidemic form at once and continued till the dispersion of the pilgrims, proving very fatal particularly in July and in a lesser degree in August. The entire line of the pilgrim route from Bhadrak to Poori was similarly affected, and the belief that the infection was carried into the town receives confirmation from the circumstance that 49 or 50 of the 52 cases of cholera admitted to the Poori hospital between the 21st and 23rd June occurred among the pilgrims above referred to. The remaining two or three were persons who were picked up on the road and brought to the hospital and might have also been pilgrims. The disease was also very fatally present in the district, and while it appears conclusive that it was imported into Poori by the Bhadrak pilgrims, it is also highly probable that they were indirectly the means of disseminating the disease in the district, as the centres which suffered most—thanahs Poori, Pipli, Khurda, Gope, and Bhanpur—all lay directly along the main lines of communication. Another significant fact is that the disease commenced to abate as soon after the pilgrims left the district, as from 776 deaths reported in July the number fell to 181 for the whole district in August. The Magistrate also points out that there is great cholera mortality at the shrine at Satyabadi, both among pilgrims and residents and recommends the establishment of a pilgrim hospital there. It has since been decided by the Poori Lodging-house Committee to construct this pilgrim hospital, and to apply to Government to extend the provisions of the Poori Lodging-house Act to it, so that the cost of the hospital may be met from the Lodging-house fund. Application is also to be made to extend the Act to Pipli and Bhabaneswar.

Question relating to effect of Pilgrimage on Cholera prevalence in Orissa examined.

93. In considering the effect of pilgrimage on Cholera prevalence in Orissa, we have first to see where and during what periods the festivals which attract pilgrims in large numbers are held. The information is furnished in the subjoined table, which, however, does not include the minor festivals, which are attended by the residents of the districts in small numbers. Five such festivals are held in Poori during March, August and November, where about 5,000 to 8,000 people assemble; five in Balasore, two in the town in May and February, and three in the sub-division of Bhadrak between the 11th and 14th of March, which are attended by 2,000 to 4,000 persons; and the Baroni mela is held in the large towns in Cuttack, particularly in Jajpur, for three days in June. The people who attend this festival come from miles around the places where it is celebrated, the assembly at Jajpur, numbering about 10,000:—

Names of Festivals.	Where held: District	Where held: Locality	Duration		Estimated Gathering.
Makar Sankranti	Poori	Khurdah thanna	12th January to 7th February	27 days	60,000
Pitheran Jatra	Do	Pipli ,,	16th ,, to 18th January	3 ,,	25,000
Chandrabhaga Jatra	Do	Gope ,,	on 3rd February	1 ,,	50,000
Shivaratri Jatra	Do.	Poori town	25th and 26th February	2 ,,	60,000
Jhulon or Dole Jatra	Do	Ditto	11th and 12th March	2 ,,	30,000
Panch Dole or Jhulon Jatra	Do.	Pipli thanna	14th to 16th March	3 ,,	20,000
Ashoke Astomi	Do.	Khurda ,,	3rd to 8th April	6 ,,	40,000
Jham Jatra	Do	Gope ,,	11th to 16th ,,	6 ,,	15,000
Chandan Jatra	Do.	Poori town	28th April to 18th May	21 ,,	20,000
Ruth Jatra	Do	Ditto	25th June to 10th July	16 ,,	50,000
Panchak Jatra	Do	Ditto	30th October to 3rd November	5 ,,	30,000

This table shows that, making allowance for the time taken up in arriving and departing, a very large number of pilgrims were present and passed to and from the districts of Cuttack, Poori and Balasore from the beginning of January to about the end of July, particularly during June and July on account of the car festival; that they were again present during October and November; and that the districts were free from them during August, September and December.

The subjoined table shows the mortality from Cholera during each month of the years 1880 to 1884 in all the circles in the three districts in Orissa.

An examination of these statistics yields the following results: In *January* the mortality from Cholera was low throughout the districts during all the years under notice, excepting in Balasore town in 1884. In *February* the suffering was still lower generally, except in the Poori town, which was affected considerably. During both these months a large body of pilgrims were either traversing the districts, or had converged at the centres where the festivals were being held. From *March* to *May*, with an accession of pilgrims and dispersion of pilgrims, a distinct rise in mortality is seen generally, the Poori town the centre of attraction, the Salipur, Kendrapara, Aul, Jajpur and Dharmsala thanahs in Cuttack, through which the bulk of the pilgrims pass, and the Jellasore, Bhadrak and Dhamnagar thanahs in Balasore through which the direct pilgrim route lies, being seriously involved. It will be noticed that the Poori town enjoyed comparative immunity from the disease during May. In connection with this, it should be stated that a very large number of pilgrims had left the town this month, and was replaced by a comparatively smaller number. *June* is seen to be a month of somewhat diminished suffering. Cuttack and Poori (excepting the Poori town) shared largely this immunity, but Balasore exhibited greater suffering during 1882, 1883 and 1884. Although the car festival took place late in this month—on the 25th—the large assemblage of pilgrims in the Poori town would appear to have raised the mortality in it very much. *July* was, on the whole, pre-eminently affected by cholera, which was present generally throughout the three districts. It was during this month that the car festival broke up in Poori town and the pilgrims dispersed, re-traversing the pilgrim routes on their homeward journey. It is singular, however, that many circles escaped the severity of the disease in 1880 and 1883, particularly during the former year. In *August*, *September* and *October* there was a marked reduction of mortality. The pilgrims were absent to a great extent from the districts during these months. *November* and *December*, during which pilgrims, numbering 30,000, were present at the Panchak festival, and had also dispersed after it broke up, exhibited conspicuous rises in death-rates in many of the circles. It should not be omitted to be stated that in the Cuttack town and thanahs Tirtol, Banka, and Juggutsingpore, which were not frequented by pilgrims, there was very little cholera.

On the whole, however, I am not prepared to uphold the view that cholera is dispersed throughout Orissa entirely by foreign pilgrims and inhabitants of the districts, who largely frequent the different temples at times of festivals; yet there is, as shown above, such correspondence of disease with periods of festivals that this view cannot easily be set aside, and it must be remembered that this tends to explain the great rise of the disease in June and July, a time of comparative immunity from cholera in Bengal.

There is a pilgrim hospital at Poori and a dispensary at Pipli, and wayside shelters for travellers along the various roads. The camping grounds are, however, stated to be insufficient in size, and the wayside houses to be too small, badly supplied with water, and in an insanitary condition.

Having visited Poori, I feel that it is necessary to record that the present bad state of its water-supply and conservancy requires to be rectified, especially the former. Water is drawn from the usual shallow wells, and cannot be free from contamination in such a porous soil as the town stands on, which consists entirely of sand. It would be a gain to India generally if some pure water-supply were secured, and I submit that the subject is one well worthy of the attention of Government in the Public Works Department. The conservancy of the town could be greatly improved by the introduction of part IX of the Municipal Act III (B C.) of 1884.

Such cholera centres as Khurda and Pipli should also be placed in a thoroughly sanitary condition both as to water-supply and conservancy. The cost might be partly met from the Poori Lodging-house Fund.

94. *Balasore.*—The prevalence of cholera in this district was very great. It occupies the first place on the list of cholera-stricken districts in the whole Province. Seven thousand three hundred and seventy-three persons, or at the rate of 7·79 per 1,000 of population, were victims of the disease in 24·05 per cent. of the villages. The mortality exceeded that of the preceding year by 5·67 per 1,000, and that of the quinquennial lustrum

1879-83 by 3·56 per 1,000. The disease prevailed specially from January to July and again in November and December, but was most severe in May and June. The death-rates returned by the circles in this district are exhibited in the margin. All these circles may be said to be influenced by the pilgrims passing to and from Juggannath, yet cholera was by no means equally distributed over them, its extreme severity being limited to the urban and rural areas of Balasore and to the rural circles of Soro, Basudebpur and Chandballi, while Dhamnagar, Bhadrak, Jellasore, through all of which the direct pilgrim road from Cuttack to Midnapur passes, suffered in a very minor degree. As a rule the pilgrims are not permitted to enter the Balasore town in large numbers, but are made to travel by the trunk road, which just touches the outside of a detached part of the town, and where there are lodging-houses for their accommodation. There are also a pilgrim hospital at Balasore and charitable dispensaries at Balasore and Bhadrak to afford relief to sick pilgrims.

Cholera prevalence in Chota Nagpore.

95. This information is furnished in the following table:—

Districts.	Percentages of Villages Attacked.		Mortality in 1884.		Difference in 1884 in Death-rates as compared with—		Unhealthy Months.
	In 1884.	Excess or deficit as compared with 1883.	Number of deaths.	Ratio per *mille*.	1883.	1879-83.	
Hazaribagh	2·29	1·02 *I*	1,286	1·16	·61 *I*	·79 *I*	April to August.
Lohardugga	·18	·54 *D*	191	·11	·22 *D*	·70 *D*	July and August.
Singbhum	·76	·51 *I*	112	·19	·13 *I*	·47 *D*	April and May.
Manbhum	5·74	4·43 *I*	1,849	1·74	1·45 *I*	·82 *I*	April to July.
Total ...	2·24	1·40 *I*	3,438	·79	·42 *I*	·06 *I*	April to August.

The above figures indicate that the incidence of the disease in the Chota Nagpore Division of the Province, although resulting in slightly enhanced mortality in comparison with the death-rates of 1883 and the quinquennium 1879-83, was, on the whole, not severe. The number of deaths amounted to 3,438 in 2·24 per cent. of the villages and among a population numbering 4,334,178, and the proportionate death-rate was ·79 per 1,000 of population. The corresponding figures of the preceding periods with which comparison is instituted, are for 1883, deaths 1,605, rate of mortality ·37 per 1,000 of population, and percentage of villages attacked ·84, and for the lustrum 1879-83, deaths 3,170, death-rate ·73 per 1,000, and percentage of villages pervaded by the disease 1·99. The unhealthiest months were April to August.

96. The history of cholera prevalence in all the four districts which compose the Chota Nagpore Division—*Hazaribagh*, *Lohardugga*, *Singbhum*, and *Manbhum*—may be considered together, as in none of them was the suffering noticeably great. From the figures furnished in the foregoing table it appears—

(1) That Manbhum suffered the most (1·74 per 1,000), Hazaribagh next (1·16 per 1,000), Singbhum in the third degree (·19 per 1,000), and Lohardugga the least (·11 per 1,000).

(2) That in none of these districts was the disease widespread.

(3) That in comparison with the mortality during the preceding year, while Lohardugga exhibited a decrease to the extent of ·22 per 1,000 of population, the other three districts exhibited increase, the increment in Manbhum only being noticeably higher, viz. 1·45 per 1,000.

(4) That in comparison with the incidence of the disease during the lustrum 1879-83, while Lohardugga and Singbhum were healthier, Hazaribagh and Manbhum returned higher mortality, but the increase was not great, amounting to only ·70 and ·82 per 1,000 of population respectively.

(5) That in seasonal fatality, April to August exhibited most deaths, and maximum severity was reached by Hazaribagh and Lohardugga in August, Singbhum in April, and Manbhum in May. No deaths were recorded in January in all the four districts, and Hazaribagh also enjoyed similar freedom during February, November and December, Lohardugga during February to April and October to December, and Singbhum during August, September and December.

(6) While noticeably high death-rates were not returned from any circle in Lohardugga and Singbhum, the areas of greatest suffering in Hazaribagh and Manbhum were :—

In Hazaribagh.	Ratio per *mille.*
Kodarma thanah	5·24
Chowparan „	2·78
Pachamba „	2·45

In Manbhum.	Ratio per *mille.*
Jaipur thanna	4·82
Nirsha „	4·79
Topechanchi „	4·68
Jheria „	3·11
Gourangdi „	2·38
Purulia „	2·31
Jhalda „	2·01

97. *Hazaribagh.*—The observations of Dr. Cobb, who has been for years in this district, are worthy of record, viz., that cholera always commences in March in the neighbourhood of the Grand Trunk Road, wherever traffic is greatest; spreads gradually over the lower levels of the district in the north and east; confines itself to these tracts until the rains have well set in; and at this period, if other meteorological conditions are favourable to its development, it rises to the higher parts of the district.

98. *Manbhum.*—Thanah Nirsha and Topechanchi, which suffered very considerably from cholera, are situated on the pilgrim route. A smart outbreak occurred among the colliers in the coal mines at Chirkoonda and the neighbouring villages. The Civil Surgeon notes that "the sanitary condition of Chirkoonda is very defective—bad water, miserable huts, accumulated filth lying promiscuously about, &c., and each year repeats the same sad story of epidemics of cholera and small-pox. Without exception this is the dirtiest portion of district." There are five tanneries in this locality, which have been for years a source of great nuisance. They are situated near dwelling-houses, and the moist hides which are put out on the sand to dry emit a sickening stench perceptible at a long distance. The hides are washed in the Burakur river, and the people of Chirkoonda drink this water, as there are no tanks there, and only eight wells, which are dry during the hot months.

99. **Port of Calcutta.**—Cholera prevailed with greater severity among the *European seamen* in Port, numbering 21,182, during the year under review, than during the preceding year, but with diminished severity in comparison with its incidence during 1881 and 1882. The subjoined statement supports this observation :—

Cholera among European Seamen.

	Average population.	Admissions to hospital.	Deaths.	Ratio per *mille.*
1884	1,684	67	36	21·37
1883	1,860	65	37	19·89
1882	1,792	64	41	22·87
1881	1,350	51	33	24·44

In addition there occurred one death from this cause out of hospital. The seasonal incidence of the disease in the Port followed the same course as it did in the town, viz., prevailing very mildly in January, increasing in severity from February, reaching maximum intensity in April (when 21 deaths occurred out of 36, the year's total), then declining to the end of the year with an exacerbation in November and December.

100. The disease also prevailed with abnormal severity among the *Native Floating population*. Compared with 1881, 1882 and 1883, the mortality was considerably higher during the year under review, *vide* undernoted figures:—

Cholera among the Native Floating Population.

	Population.	Admissions to hospital.	Deaths in hospital.	Deaths out of hospital.	Total deaths.	Ratio per *mille*.
1884 ...	25,409	95	38	100	138	5·43
1883 ...		69	34	82	116	4·56
1882 ...		54	27	88	115	4·52
1881 ...		32	16	54	70	2·75

It should, however, not be forgotten that with greater care and attention to the subject, particularly since the appointment of the Native Inspector, it is reasonable to expect that a larger number of the actual casualties occurring among the boatmen are being brought to light year by year, and that this fact might have had a share in producing the progressive increase in mortality exhibited in the above table. The most unhealthy months were March, April and May, when 46, 51, and 16 deaths were recorded respectively.

SMALL-POX.

101. SMALL-POX appears to have prevailed in the Province during the year under review with considerably aggravated severity in comparison with its incidence during the preceding year, as will be apparent from the following figures. The reported number of casualties amounted to 18,533 against 9,714 and the proportionate death-rate to population to ·28 per 1,000 against ·14 per 1,000. The disease prevailed with more or less severity in 53 circles against 30, and was absent from 224 against 284; and it invaded 2·96 per cent. of the villages against 1·73 per cent.

Extent of prevalence and fatality of Small-pox.

102. The urban and rural circles contributed to the mortality of the year in the proportions indicated in the margin.* It will be observed that the proportionate suffering, in comparison with that of 1883, was greater in the former than in the latter circles, and yet the general belief is that the urban circles are better protected than the rural.

Adapur in Chumparun ...	1·07	·49
Sherghati in Gya	1·07	·32
Barhi in Hazaribagh ...	1·07	·07

It will be observed that the areas of highest suffering from small-pox mostly belong to the districts of Gya (10), Sarun (8), Patna (7), Chumparun (5), and Hazaribagh (7), and it was these districts which returned, on the whole, the highest death-rates, viz. 1·54, 1·27, 1·00, 1·00, ·85 per 1,000 of their population respectively. Of them Gya and Sarun have not as yet been touched by vaccination, Chumparun has been very partially protected, but Patna was said to have been thoroughly protected, excepting a few villages in each of its thannas, but the prevalence of small-pox in it proves that the statement is not to be relied on. The returns from Hazaribagh show that the children in it have for the most part been protected, but that a large number of the adult population are unprotected.

103. The marginal table, exhibiting the seasonal incidence of small-pox, repeats the experience of former years, viz. that the disease is most prevalent during the hot months of March to June.

Seasonal fatality of Small-pox.

	Deaths in 1884.	Average deaths in 1879-83.		Deaths in 1884.	Average deaths in 1879-83.
January	826	1,506	July	1,312	1,257
February	1,111	2,202	August	717	792
March	637	3,036	September ..	336	630
April	3,715	3,018	October	354	428
May	3,70[illegible]	2,[illegible]8	November	392	520
June	2,[illegible]13	1,886	December	585	873

104. From the table in the margin it is again seen that the largest number of deaths from small-pox occurred among infants and children, as no less than 72·27 per cent. of the total mortality from this cause was borne by them. In comparison with 1883 very nearly double the number of infants and children died from the disease. The mortality among male children was also, as usual, somewhat in excess of that among females.

Mortality among Infants and Children from Small-pox.

	Deaths.		Proportion per cent. of total mortality.		Proportion per cent. of males to females deaths.

105. The following information extracted from the local reports, relating to the incidence of the disease in some of the districts, may be found interesting.

Chief particulars relating to the prevalence of Small-pox in Districts.

106. *Burdwan*.—The disease was most prevalent in Mungulcote, Raniganj and Sahibganj, but it never took persistent hold of any locality. It was found that in the Burdwan town the disease was imported by travellers arriving by rail. In *Shahabgunge* there occurred 27 cases attended with 1 death. Vaccination was pushed on and the disease was suppressed. In *Beerbhum* the mortality from small-pox was more marked this year than in any year since 1878, and the cases were confined to thanas Soori, Bhulpore, Sacoolipore and Mouressur. After an immunity from the disease for several years, there were 2 deaths from it in the town of Soori during the year under review. Both of the deceased had been previously vaccinated, but the disease was communicated to them after importation by their neighbours. The cases occurred in May, when the vaccination season was over, and the efforts of the Civil Surgeon to establish lymph to arrest the development of the disease was fruitless; but the Magistrate says that the disease was apparently prevented from spreading by segregative measures and careful medical attendance. *Midnapore*.—For the past three years small-pox has prevailed with considerably mitigated severity in this district, and this improvement is credited to the progress made in vaccination. There were however a few local outbreaks marked with greater fatality than in 1883, notably in the Sabong rural circle, where vaccination is most objected to. A smart outbreak also occurred in village Chowsarpore in thanna Daspur. According to Assistant Surgeon Preumber Nath Mitter, Deputy Superintendent of Vaccination, Metropolitan Circles, the disease was introduced into the village by a person coming from Calcutta with it. He also noticed that of 10 families in this village who refused vaccination, small-pox appeared among 4. *Hughli*.—Small-pox in virulent form broke out in the Serampore Municipality. It was traced to importation by a man who had gone to Benares and returned with the disease.

Nuddea.—In this district the Kureemporo thanna suffered the most, as 152 casualties, which is more than half of the total deaths in the district (297), occurred here. The disease is always prevalent in this thanna and present throughout the year. The people do not resort to medical treatment, and the Ferazees—a sect of Mahomedans who will not accept of vaccination on religious grounds—were the greatest sufferers. A severe outbreak occurred in the *Kushtea* town, attacking 39 and killing 10. It was ascertained that the disease was introduced by a Kabuli. In *City Murshidabad* a boy aged twelve years, who had been vaccinated when he was two years old, was attacked. He also appears to have brought the disease from Calcutta. *24-Pergunnahs.*—The disease again prevailed with severity in the Suburban Municipality. Dr. Ghose, the Officiating Deputy Sanitary Commissioner, Metropolitan Circles, observed that Baliaghatta in this Municipality is resorted to by boats from all the Eastern districts where unprotected Ferazees abound, and he thinks that this is the locality through which small-pox is imported into this Municipality. In the *Baranagore* Municipality small-pox broke out among the up-country employés in the mills at Hupta bazar. It was said to have been introduced by a man who came from Behar. There were 26 cases and 2 deaths. *Dinagepore.*—The Magistrate says that, as the Dinagepore town is yearly almost wholly burnt down and thoroughly cleansed by fire, he thinks that for this reason perhaps small-pox gets no hold on the place. *Rajshahye.*—In this district only the town of Beauleah suffered severely. The disease appeared in it in April of the year under report and continued to prevail throughout the following months up to April 1885, with mitigated severity in September and October, and marked virulence during the remaining months. There is a municipal vaccinator in this town, and the Compulsory Vaccination Law has been in operation in it since 1881, and is said to have worked remarkably well. Notwithstanding these advantages, the mortality amounted to 1·97 per 1,000 of population against ·05 per 1,000, the highest in the rural area, with the entire absence of the disease from 9 circles out of 13 in this area. Under these circumstances, I cannot see how the Civil Surgeon can maintain his opinion that the municipality is "well protected." *Dacca.*—There occurred 135 deaths from small-pox in the Dacca town against none in 1883, 1882, 1880, and 1879, and only 3 in 1881. It thus appears that the immunity which this town enjoyed from the disease has ceased, and this is the more apparent as in the beginning of 1885 the disease was still prevalent, particularly among Mahomedans, who most obstinately oppose vaccination. The Civil Surgeon saw many cases of small-pox after inoculation as well as after vaccination, but none of the fatal cases seen by him had been protected in either way. Act V (B.C.) of 1880 should be introduced into this town. *Backergunge.*—It was observed that small-pox prevailed most in this district during the inoculating season, that is from December to July. *Mymensing.*—As in the preceding year, the Netrokona thana, which includes a large Garrow population, suffered most from small-pox, returning 126 out of 160, the total deaths of the district. *Chittagong.*—There were only 2 deaths from small-pox during the year, 1 in the Chittagong town, and the other in Bánskhali thana, and these cases, the Civil Surgeon suspects, were incorrectly diagnosed. The absence of the disease from this district, which has not received regular and systematic protection by vaccination, is remarkable. *Noakhalli.*—In this district the disease prevailed most severely in thannas Ramgunge, Hatia and Lukhipur, but the suffering is said to have been curtailed by vaccination. Nevertheless, the death-rates in these thannas amounted to 4·66, 1·36, and ·83 per 1,000 of population respectively. The Assistant Surgeon in charge attributes the reduction of mortality in this district to vaccination having been systematically carried on in it during the past two years. *Patna.*—There was considerably more small-pox in this district during the year under review than during the preceding five years. Every circle, excepting Barh town and Behar thana, exhibited enhanced mortality. The marked severity of the disease, considering that it occurred in the second year after the supposed completion of the vaccination of the district, demonstrates clearly that the vaccination done had been quite insufficient for the proper protection of the people.

Shahabad.—In this district the Arrah subdivision, in which vaccination was carried on during 1883-84, is found to have suffered more severely during the year under review than the other parts of the district. This result indicates that the vaccination establishment in Behar under the control of a Bengali Assistant Surgeon can only vaccinate a small proportion of the people. *Sarun.*—Small-pox prevailed very severely in this district, and was generally distributed throughout the whole district, every circle returning a higher death-rate. The prejudices of the people of all classes against vaccination are great and deeply rooted. Persuasion and general influence are of no avail. The Civil Surgeon advocates the introduction of the law prohibiting inoculation, as he says that unless this is done it will be quite impossible effectually to stamp out small-pox, particularly in years when it is generally diffused. But with the suppression of inoculation vaccination must be introduced, and this cannot be done with the present establishment for some years to come. *Chumparun.*—There was a good deal of the disease in this district, particularly in thana Baguha. This is one of the districts in Behar which has been very partially vaccinated. *Monghyr, Bhagulpore, Sonthal Pergunnahs.*—Small-pox prevailed generally in these districts, every circle being affected, notably those in their sudder subdivisions. Thana Kharakpore in Monghyr, thana Kumarganj and the town in Bhagulpore, and the Deoghur town were the localities of greatest suffering. It has been found necessary to depute a special establishment during the recess seasons of the past three years to suppress the disease in the affected localities; but as it re-appears yearly, I fear that the establishment does not evince sufficient care, attention and energy in the performance of their work. *Lohardugga.*—There was an extensive epidemic of chicken-pox in this district, prevailing, in fact, throughout the plateau. *Manbhum.*—Hossengunge, a thickly-populated portion of the town of Purulia, was threatened with a severe outbreak of the disease from a carter introducing it from Sitarampore, where it was very prevalent, but precautionary measures having been taken by isolating the carter and vaccinating all the unprotected, the danger was averted. In some badly sanitated villages in Chirkoonda, the disease appears annually among the colliers, and this year was no exception to the rule. There were 50 cases, but the disease was of a mild type and unattended with deaths. At *Kasipur* in thanna *Gaurandi*, there occurred an outbreak of small-pox commencing in February. It appears that a resident of the town went to the Baraker railway station and was infected there. On his return the irruptions appeared, and soon after some of his neighbours were attacked, and some others subsequently. The people endeavoured to hide the presence of the disease; nevertheless, with the assistance of the Police 200 of the children were vaccinated. Small-pox was absent from the *Darjiling* and *Julpaiguri* districts, and the *Bankura, Jessore, Khulna, Pubna, Maldah, Rungpore* and *Chittagong* districts were very mildly affected.

107. *Port of Calcutta.*—In the Port of Calcutta 7 cases against 5 in the preceding year occurred among the *European* seamen, but none of them proved fatal. Among the *Native Floating population* 5 deaths were reported to have occurred, being at the rate of ·19 per 1,000 of population against ·07 per 1,000 in the preceding year. Of these casualties 4 occurred in hospital among 9 who were admitted suffering from the disease. Of 4 steamers which arrived in Port with returning pilgrims from Jedda, 3 had small-pox on board, and were consequently detained at Garden Reach for fumigation and cleansing before proceeding to moorings. The Health Officer states that the condition of one of these steamers, the *Empress of India,* and the arrangements for the comfort of the passengers were satisfactory. This he ascribes to the judicious utilization of the new rules for the management of pilgrims by the native doctor, to whom a copy had been furnished. On the other hand, he found the condition of the passengers on board of another of these steamers, to which the rules had not been supplied, unsatisfactory, 14 cases of small-pox having occurred on board during the voyage, 5 among its European crew. It appears to him therefore that the general adoption of these rules in vessels conveying pilgrims would bring about an improvement in the condition of the passengers during the voyage.

FEVER.

108. The mortality due to this malady during the year under review was greater than in any of the preceding years of which records are in existence, as will be apparent from the figures in the marginal table. Nevertheless, I still consider that the enhancement of the mortality during 1884 is due mainly to improving registration as the subject is found to have received increased attention, and as the general fever history of the Province for the year under report does not, on the whole, show that it prevailed unusually, except in a few districts, a contingency common to every year. Moreover, an examination of the marginal figures shows that the numerical increase in the number of deaths has been steady year after year and has made large strides during recent years, during which more care has been accorded to registration, while no circumstances have occurred which justify the belief that the Province *generally* is getting more feverish than before. The disease was diffused in 1884 over 64·78 per cent. of the villages against 57·37 per cent. in the preceding year, and 64·80 per cent. during the quinquennium 1879-83. It manifested great virulence in 29 circles against 27, less activity in 116 against 130, and normal prevalence in 504 against 491.

Extent of prevalence and fatality of Fever.

	Deaths	Ratio per *mille*
In 1884	966,233	14 60

„ 1883	913,766	13 81

109. The contributions by the urban and rural circles, respectively, to the mortality of the year are indicated in the table in the margin. The comparison with the figures of the preceding year again shows that while the proportionate death-rate in the urban circles had diminished, in the rural circles it had increased, establishing the inference of the preceding year that the rural circles are on the whole more unhealthy than the urban ones.

Comparative mortality from Fever in the Urban and Rural circles.

	Deaths		Ratio per *mille*	
	1884	1883	1884	1883
Urban circles	31,701	34,025	12 89	13 77
Rural „	934,532	879,741	14 66	13 81

110. The figures in the margin illustrating the seasonal incidence of fever in the entire Province again maintain the deductions submitted year after year, viz., that the severity of the disease begins and progresses in intensity after the rains have well set in, and is most virulent in January, October, November and December, especially in the two latter months, when the evaporation of moisture from the sodden soil is rapid and the daily range of temperature considerable.

Seasonal incidence of Fever.

	Deaths in 1884.	Rainfall in 1884 Inches.	Average deaths in 1879 83

July	65,258	11 27	55,662

111. This information is furnished marginally. The most noticeable point is that for three consecutive years the greatest amount of suffering was limited to some of the districts in the Burdwan, Presidency and Rajshahye Divisions. It is gratifying, however, to find that while the mortality was higher in Rajshahye (which again heads the list given in the margin), it has diminished in some of the worst districts.

Districts in which Fever prevailed most severely.

112. The more important statistics illustrating the incidence of fever in each district and the details of local outbreaks of the disease, which appear to be interesting and worthy of record, are subjoined.

History of the incidence of Fever in the Districts.

BENGAL.

113. In the Bengal division of the Province 584,893 deaths from fever were recorded in 70·42 per cent. of the villages among its registered population, numbering 35,073,770, the proportionate death-rate being 16·67 per 1,000. In 1883 there were 576,474 deaths, or at 16·43 per 1,000 in 67·94 per cent. of the villages, and during the lustrum 1879-83, 508,230 deaths, or at 14·49 per 1,000 in 69·46 per cent of the villages. These statistics indicate that the disease extended over a larger area in Bengal than during both the periods with which comparison is instituted, but that the mortality, while not noticeably greater than in 1883, was sensibly in excess of that of the lustrum 1879-83. It should, however, be recollected that registration was more defective during the latter period than at present. The most unhealthy months were as usual January to May and October to December, the latter period more so. As usual, there was more fever in Bengal than in any of the other divisions of the Province.

Incidence of Fever in Bengal.

114. In the following table are submitted the fever statistics of the Burdwan Division of Bengal :—

Incidence of Fever in the Burdwan Division.

Districts.	Percentages of villages attacked by fever.		Mortality in 1884.		Difference in 1884 in death-rates as compared with—		Unhealthy Months.
	In 1884.	Excess or deficit as compared with 1883.	Deaths.	Ratio per mille.	1883.	1879-83.	
Western Districts. Burdwan	85·68	2·18 D	26,190	18·81	4·54 D	4·96 D	January to March and October to December.
Bankura	59·92	2·55 D	14,128	13·56	3·15 D	2·59 D	January to March, October and November.
Birbhum	83·15	3·50 I	15,517	19·53	2·74 D	1·54 D	January to April and October to December.
Midnapore	66·33	1·41 I	37,208	14·79	·52 D	1·38 I	January, February, November and December.
Hughli	78·23	·63 I	14,236	14·02	·32 D	·77 I	January, February, November and December.
Howrah	66·44	2·29 I	5,333	8·30	·03 D	·25 D	January, November and December.
Total	70·26	·45 I	112,612	15·23	1·81 D	·99 D	January to March and October to December.

From the figures in the above table it is seen that while fever prevailed in the Burdwan division somewhat more extensively, its fatality was considerably less in connection with both the periods with which comparison is instituted.

115. *Burdwan.*—There was a very considerable diminution in fever prevalence and mortality in this district in comparison with its incidence during 1883 and the lustrum 1879-83. The death-rate amounted to 18·81 per 1,000 of population against 23·35 per 1,000 during 1883 and 23·77 during 1879-83, and 86 per cent. of the villages were invaded by the disease against 88 per cent. during the preceding year. The unhealthy months were January to March and again October to December, and the circles named in the margin exhibited the highest death-rates. It was observed that new cases of the ordinary malarious fever from which the district had long and largely suffered were fewer this year; but the number of people labouring from chronic fever with its usual complications was large, enlargement of the spleen among old and young being so remarkably common that Dr. Purves, the Civil Surgeon, is of opinion that 50 per cent. of the population have this affection. He also notes that the

Cutwa " ...	21 61	Mungulcote " ...	19·89

reduction of the fever is referable to the very deficient rainfall; "the soil never got properly saturated, and now tanks in Burdwan are very dry which were never known to dry up before."

116. *Bankura.*—In this district also there was considerably less fever. The death-rate stood at 18·56 per 1,000 of population in 60 per cent. of the villages against 16·71 per 1,000 in 62 per cent. of the villages in the preceding year, and 16·15 per 1,000 during the quinquennium 1879-83. The seasonal incidence of the disease corresponded closely with that in Burdwan, and the areas of greatest suffering were those indicated marginally. It is gratifying to learn from the Civil Surgeon that the fever which almost decimated the low-lying parts of the district bordering on Burdwan (thanas Bishenpore, Kotulpore and Indas, and the eastern portion of Gungajalghatti) in 1881, when the death-rate was 20·96 per 1,000 of population, has since been steadily declining in severity till during the year under review it caused the deaths of only 13·56 per 1,000 of the population. It cannot, however, yet be said that the incidence of the disease is normal. During this year the greater number of fever cases again occurred in the above circle adjoining Burdwan, where the land is flat and marshy and the natural drainage defective. Kotulpore and Bishenpore, which suffered most, are besides very badly drained and covered with jungle. On the other hand, the laterite tracts, where the soil is porous and the natural drainage very good, enjoyed comparative immunity from the disease, and here it is uncommon to find cases of advanced malarial cachexia. The Civil Surgeon attributes the decadence of the disease to uniform rainfall, which was in no month excessive, and to "the fact that the wave of malaria which spread over the district from Burdwan in 1882 seeming to have expended its virulence."

	Ratio per mille
Kotulpore thanna ...	20·63
Bishenpore „ .	18·16
Bishenpore town .	16·11
Indas thanna	16·07

117. *Birbhum.*—In this district a larger tract of country, represented by 3·50 per cent. of additional villages, was pervaded by the disease, and the death rate 19·53 per 1,000 of population was the highest in comparison with those of the other districts in the Burdwan Division. This mortality was, however, lower by 2·74 per 1,000 of population as compared with 1883, and by 1·54 per 1,000 with that during the lustrum 1879-83. The areas named in the margin returned the highest death-rates. It was noticed that in thana Bolpur the mortality was severe among old and worn-out sufferers. It is also said that in the town of Soori, while acute cases of most virulent type cropped up here and there, the mortality was by far the greatest among chronic sufferers. But on the whole, the health of the town was better this year than during the last, and this result was attributed by the Civil Surgeon to the same climatic cause that was in operation throughout the district, although grave defects exist in the sanitation of the town. Referring to the seasonal incidence of the disease, and to the influence of rainfall in diminishing its severity, he writes:—"Fever sets in with the monsoon and rages till the advent of the cold weather. The failure of rain this year kept the soil dry, and the cause of generation of malaria was thereby held in abeyance. Up to the end of July we had 21 inches of rain against 46 inches in 1883, and the total rainfall did not exceed 45 inches against the average fall of 60 inches for the last 20 years. Thus the relationship of fever with the quantity of rainfall has been always a constant phenomenon."

	Ratio per mille
Bolpur thanna	26·55
Soori „ .	27·30
Soori town	20·51
Sakulipore thanna	19·19

118. *Midnapore.*—In this district, while the prevalence of the disease extended over an additional 1·41 per cent. of the villages, there was a diminution in fatal results to the extent of ·52 per 1,000 of population in comparison with the death-rate of 1883, the total death rate of the district being 14·79 per 1,000 of population. But, in comparison with the mortality during the lustrum 1879-83, the death-rate was higher by 1·38 per 1,000. The circles marginally cited suffered the most, and the unhealthiest months were January, February, November and December. In connection with the prevalence of fever in this district, the Civil

Surgeon makes the following observations:—(1) That the incidence of the disease has been on the decline since 1877, excepting that in 1881 there was an exacerbation. (2) That of late years the disease has taken strong hold of the thannas named above in the margin, excepting Keshpur. The Magistrate is of the same opinion. (3) That while the thannas in the north of the district, which originally suffered most, are having less fever, those in the south are becoming unhealthier, so that it is anticipated that when fever again prevails epidemically the whole district down to the sea coast will suffer. Dr. Ghose, the officiating Deputy Sanitary Commissioner, Metropolitan Circles, visited several thannas in this district, and I should have wished to have reproduced, had space permitted, his description of their sanitary condition, &c.; but I cannot refrain from submitting his observations with regard to the villages in thanna Panchkura. He says: "All these* villages, with the exception of churs Najooreh and Bilkota, are within the protective embankment along the right bank of the Roopnarayan river. The drainage from them is perfect, *i.e.*, all tide and flood water is excluded by means of embankment and sluice gates, and surface channels drain out the last dregs of rain water through these sluices when no longer required for paddy cultivation; the result is that no vestige of malarious cachexia is to be seen in the people. But the people of churs Najooreh and Bilkota living on *churs* generally inundated during the rains have well-marked signs of malarious disease in them. Those who wish to study the effect of drainage on malarial fevers and on agriculture ought to come here and see the condition of the people within the embankment. In the two villages on the *churs* outside the embankment the paddy crop is uncertain, liable to the rotting effect of inundation and the parching effect of drought. The pulses, as a rule, are affected by worms. The oil-seeds grow but indifferently. The only paying crop is water melons, which do well in the dry weather in all *chur land.* Whereas within the embankment, where no such thing as a bhil could be seen, the paddy was perfect, and I saw in many places after the paddy had been cut down, the pulses and oil-seeds have been sown broadcast and doing very well. Those who declare that well-drained land is unfit for paddy cultivation ought to visit these places. What struck me most in all these villages was the entire absence of low jungle—a state of things I have not seen in the deltaic portions of Bengal. I also observed that the people do not dig ditches in village sites for taking earth for their plinths or walls, but uniformly take 9 inches from the surface of their fields, which is soon replaced by silt washed down by rain. Water-supply is bad. There are some very small tanks, but owing perhaps to good drainage they are not so choked with weed as tanks generally are in Lower Bengal." I may add that, with regard to the villages in thannas Keshpur and Midnapore, he says that they are more or less malarious owing to being under the influence of the high level irrigation canal. There is no low-lying jungle nor many stagnant ditches to be met with. It is only a question of pent up moisture in the ground.

119. *Hughli.*—In this district also fever did not prevail with any marked or greater severity than during the preceding year, although a somewhat larger area of the country was pervaded by it. In comparison, however, with the lustrum 1879-83, there was increase in fatal results. 14·02 per 1,000 of the population died in 78·23 per cent. of the villages against 14·31 per 1,000 in 77·60 per cent. in 1883 and 13·85 during 1879-83. To the mortality of the year the Serampore subdivision contributed 1,167 casualties, or at 11·83 per 1,000 of population, which is in excess of the death-rate of the preceding year by 1·41 per 1,000. In seasonal incidence, January, February, November and December exhibited the largest number of deaths, and the circles named in the margin returned exceptional mortality. The villages in thanas Haripal and Kristonagore, and those in the vicinity of marshes and along the banks of the Kana and Sarasati nuddis, are said to have suffered very much owing to the channels of those nuddis

	Ratio per *mille*.
Hughli thanna ...	22·28
Pandua " .	19·51
Balagarh "	19·32
Shambazar town ..	18·77

having become obstructed. Referring to this obstruction, the Subdivisional Officer of Serampore writes: "I may here remark that the state of the channels of the Kana nuddi and Sarasati has greatly deteriorated since last year, and that there is reason to fear that the important and costly sanitary work which was completed when the water of the Damoodar was introduced into these streams is now going to ruin for want of a little attention and a trifling amount of expense. A large sum was spent in bringing water down from the Damoodar to these channels, and an immediate improvement in the health of the people was the result. Nothing whatever has been done to prevent the channels from being blocked up again and to protect them from pollution. They are becoming blocked up again by fishing weirs and by the collection of masses of floating weeds. The inevitable result must be that in a few years these channels will become as bad as ever, and the epidemic which depopulated the neighbouring villages will again occur. I must here express my total inability to understand a policy which spends lakhs of rupees on an important sanitary work, and then leaves that work to go to ruin in a few years in order to save an annual expenditure of a few hundred rupees. Possibly I may not correctly understand the facts of the matter. As far as I do understand them, however, the above appears to me to accurately summarize the facts of the case." The Civil Surgeon also observes that the channels are being silted up and in places masses of floating weeds obstruct them owing to weirs thrown across for fishing purposes, and that the villages along their banks are becoming unhealthy again. A copy of these remarks has been submitted to Government in the Public Works Department for orders. There was also a good deal of fever in the towns of Bhudressur and Kotrung and in the Connagur, Mahesh and Rishra wards of the Serampore Municipality at the close of the rains, and, as usual, most of the cases succumbed in the cold weather. Concerning the fever prevalent in Serampore, and its causes, Dr. Barker, the Civil Surgeon, writes: "This fever is endemic and of the usual intermittent type, of a recurrent nature, associated with hypertrophy of the spleen, diarrhœa, anæmia and anasarca. Sometimes it is of remittent character, and occasionally attended with typhoid symptoms, particularly about the beginning of the cold weather. It is of malarious origin, and dependent a good deal on the low swampy nature of the country, and damp atmosphere, hence it is least severe during the dry hot months, and is of maximum intensity at the close of the rains, when the air is saturated with moisture from extensive evaporation, the whole country being covered with water and loaded with deleterious matter from decaying vegetation. Of course, the water-logged state of the soil simply exaggerates the above conditions, but I do not believe that this is so much due to obstructed drainage from roads, railways, or embankments (which are mostly provided with sufficient waterways) as to the enormous silting that is steadily going on in all places, fields, roadside drains, channels, rivulets, &c. It is this in an almost level country that causes all the mischief." It is also suspected that a good deal of the fever in July and August is traceable to irrigation and exposure while planting rice.

120. *Howrah.*—It appears that in this district there was less fever than in any other district in the Burdwan Division. The death-rate amounted to only 8·39 per 1,000 of population in 66·44 per cent. of the villages as opposed to 8·42 per 1,000 in 64·15 per cent. of the villages in the preceding year, and 8·64 per 1,000 of population during the lustrum 1879-83. These figures indicate that registration is defective in the Howrah district. January, November and December were the worst months. None of the circles in this district presented conspicuously high death-rates. Dr. Ghose, the Officiating Deputy Sanitary Commissioner, Metropolitan Circles, says that some of the villages in thana Jaggutbullubpore situated along the silted up Kana nuddi are very malarious, and he observed that in the villages in thana Doomjoor malaria was the universal feature, low jungle abounded, and the Mahomedan bustees were filthy. "Those parts of the villages where men are employed in agriculture are clean, evidently because dung and sweepings are utilized as manure; but where they are employed in industry, such as tailoring, the heaps of dung and sweepings are left for years."

121. The statistics connected with fever prevalence in the Presidency Division of Bengal are presented in the subjoined table :—

Incidence of Fever in the Presidency Division of Bengal

Districts	Percentages of villages attacked by fever		Mortality in 1884		Difference in 1884 in death-rates as compared with—		Unhealthy Months
	In 1884.	Excess or decrease as compared with 1883.	Deaths.	Rate per mille.	1883.	1879-83.	
24-Pergunnahs	80·25	7·01 D	93,182	14·16	·54 D	2·02 D	January and October to December
Nuddea	98·[illegible]	10·[illegible]3 D	48,[illegible]83	[illegible]·22	1·82 I	[illegible] D	January to May, September to December
Jessore	47·18	6·04 D	13[illegible]	[illegible]·11	7·5[illegible] D	3·38 I	January to April, October to December
Khulna	6[illegible]·40	11·11 D	[illegible]	18·[illegible]2	[illegible]9 I	1·5[illegible] I	January and October to December
Murshidabad	87·37	9·82 D	[illegible]4,847	[illegible]0·[illegible]	1·[illegible]4 D	1·87 D	January to May, October to December
Total	78·86	8·36 D	183,174	20·99	·98 D	1·09 I	January to April, October to December.

The figures in the above table indicate that in comparison with 1883, a considerably less area of the Presidency Division was invaded by fever and the mortality was lower; but that in comparison with the lustrum 1879-83 the death-rate was higher by 1·09 per 1,000 of population. It is also seen that the mortality here was greater than in all the divisions of Bengal, excepting only Rajshahye. The percentage of villages attacked was 78·86 against 87·22, and the death rate stood at 20·99 per 1,000 of population as opposed to 21·97 per 1,000 in the preceding year and 19·90 per 1,000 during the lustrum 1879-83. As usual, January to April and October to December were the most fatal months.

122. 24-*Pergunnahs.*—In this district there was much diminution in both the prevalence and fatality of fever; 80·25 per cent. of the villages were overrun by the disease against 87·26 per cent. in the preceding year, and the death-rate fell to 14·16 per 1,000 of population (the lowest of all the districts in this division) from 14·70 per 1,000 in 1883 and 16·18 per 1,000 during the lustrum 1879-83. January and October to December were the worst months, and the suffering was greatest in the circles named in the margin.

The only noticeable remarks in the Civil Surgeon's Sanitary Report with reference to the prevalence of the disease in this district are that it prevailed extensively in the Baranagore Municipality after the cessation of the rains, particularly in its eastern portion, which is away from the river, attributed to the Eastern Bengal Railway obstructing the surface drainage of this portion of the town. This town is moreover full of excavations for brick-making containing stagnant water. The following facts came under the notice of Dr. Ghose, the Officiating Deputy Sanitary Commissioner, Metropolitan Circles—(1) Malarious fevers prevail in thanna Joynuggur, which is low and swampy, and requires thorough drainage. (2) Some villages in thanna Barriepur, which had been the earliest reclaimed, were tolerably free from malaria, but in others, such as Nakahtollah, Satbebee and Gourdoho, the people suffered severely from fever attended with great mortality. In these obstruction of drainage resulted in stagnation of water during heavy rains. This defect was brought to the notice of Government by me. (3) Many of the children in several villages in thanna Bussirhat were found to be pale, scrofulous, and suffering from spleen. The sanitary condition of these villages is very unsatisfactory, the drainage bad, and the water-supply worse. (4) The washings of the lac-dye factory at Cossipur in thanna Tallygunge were allowed to find their way into the public drains, and in their passage to the river emit a foul smell and keep the drain constantly moist, and houses abutting on it remain always damp. (5) Some of the villages in thanna Habra were found to be fearfully malarious owing to the stagnation of the Jaboona river, particularly from Goburdanga to its junction with the Ichamutti. Dr. Ghose was of opinion that if this matter is not early attended to, it would be difficult and expensive to remedy the evil when the river has disappeared and its dry bed occupied by riparian proprietors. The question was referred to the Magistrate,

but I regret to state that while the Assistant Magistrate of Baraset, from whom a report on the subject was called for, supported the observations of Dr. Ghose, and added that, "as there is very little current in the Jabuna, its bed has been covered with sedges and decomposing vegetable matter of every description, spreading malaria all round the villages situated on its bank," and suggested the necessity of having surveys taken and plans prepared for opening up the channels of the Jabuna, the Officiating Magistrate of the 24 Pergunnahs district set the matter aside without even consulting the Commissioner of the division, his opinion being that, "it is useless to ask engineers for plans of works which will never be carried out and would be of doubtful utility if carried out." The question, however, as to the manner in which drainage is to be effected in places where the old drainage channels no longer exercise their original functions is a most important sanitary one and should be considered in the Public Works Department as funds and opportunity permit. The following observations of Dr. Ghose regarding the health condition of the villages in the Bistopore thanna, and the causes thereof, are worth recording :— "These villages* are all situated on the bhil (cultivated, and known as the bada) in connection with the Kowrapukhur nullah. The huts are peeping out of a vast sheet of paddy-fields, and almost every house has to be reached by means of a dug-out. Paddy cultivation, fishing, and *duck-farming* are their principal occupations. The people seem to be in perfect health, children fat and healthy, and women strong and hard-working, very different from what is seen in a Bengal village. This proves what I have always maintained, that moisture *per se* is not the origin of malaria. There is too large a quantity of water here for it to be injurious, and the paddy cultivation seems to keep it tolerably pure, drawing up all organic matter as manure, which would otherwise have decomposed to sustain the various breeds of microzymes and microphytes, some of which act as disease germs in man. An observation fell from the boatmen who were poling our dug-out, and it struck us both, me and Baboo Jadub Chandra Ghose, who accompanied me. The observation was this :—We asked the men what they thought of the *bada* water. They said that after much rainfall it is not good, but now that the paddy is forming *its thor*, it is very good. Now *thor* is the rudiments of the ear of corn in the pith of the stem before it shoots out. The formation of this must draw up a lot of manure from the soil and the water, and render the water free from organic impurities. This so accords with my own observation in many places that I cannot help putting it prominently here. Go to the south of the Khulna district and parts of Burisal, cultivated very largely with paddy, and there one cannot help being struck with the fine robust constitution of the people. It is only when the deltaic khals silt up and water lies on the surface without sufficient outfalls that malaria is observed." Under direction of Government I visited, in company with Dr. Ghose, the officiating Deputy Superintendent of Vaccination, Metropolitan Circles, the country drained by the Nawyee and Soortee nullahs, and investigated into the health of the locality and the causes of its deterioration. I found from an examination of the villages and especially the boys in the village schools, that the health of the people was certainly very bad. There was evidence of the effects of malarious poisoning in nearly everybody I saw, especially in the case of the young. There was formerly a much larger population, as was evident from the many deserted homesteads in every village site and in some places along the west bank of the Soortee within the Baraset Municipality, which now form a continuous line of jungle which is used for charcoal burning. The local opinion ascribes the causes of this deterioration to the condition of the nullahs, which are now completely silted up in places and blocked by the digging of tanks on their beds for water-supply and as fish ponds. In numerous instances these tanks extend right across the nullahs, only narrow side passages being left, which are now quite dry. Small bridges, approached by embanked roads, have also been erected in places, and must in the rainy season cause much obstruction from insufficient waterway. As the beds of the nullahs where they contain water and the tanks are full of rotting vegetation, the water, which is largely used by the villagers, is of the worst character, and must have a bad effect on their general health. I think that the state of these

* Panoka | Persadpore | Nusung Chuck | Audhu Mauk. | Julpay | Umerpota | Bolakhati

nullahs and of the bhils, which they should drain, where water is kept at a higher permanent level than formerly from the connecting khals having silted up and being obstructed with fishery weirs, is a fertile cause of the low standard of health to which the people have been reduced. The Pancearah khal, which drains the Kora bhil near the Chandipore station on the Central Bengal Railway and, it is said, seventeen other bhils, are now so silted up that the villagers said that from detention of water rice could not now be cultivated in places where this was formerly possible. The whole area under consideration is so intersected with roads and railways that there is no free passage of water over the low-lying paddy fields, as was the case before they were made. Sufficient waterway has been left in an engineering point of view, but not enough to allow of easy flow for heavy or even moderate floods. In places the waterway is distinctly insufficient, even at present (in January 1885). The opening out or reconstruction of these nullahs, which was under the consideration of Government, is, under the above circumstances, a matter of urgent necessity whereby improvement in the health of the people may be reasonably expected. It appears, however, that the basin lying between the Hughli and the Nowyee cannot be drained completely into the latter, as it is cut into two by a line of high village sites running from north to south, and that the outlet towards the salt lakes of the drainage of the South Barrackpur, Baranagar and Kashipur, and low lands lying immediately west must be provided for. I have visited these places also and seen their requirements, and think that the Dentia, Kamarhattee and Barrackpore khals should be sluiced in the same way as the Khurda khal, to prevent the great influx of river water into the ground which must be already water-logged in the rains; and I further support Dr. Ghose in his proposal that a drainage scheme for the South Barrackpur, Baranagar, South Dum-Dum and more than half of the North Dum-Dum Municipalities should be specially prepared, matured, and carried out at the cost of the Municipalities concerned, by Government utilizing the many levels which have already been taken up in railway construction and for other purposes.

123. *Nuddea.*—This is the fifth year in succession that this district has suffered heavily from fever. It again occupies the second place in the list of fever-stricken districts. It is gratifying, however, to observe that the disease affected a much smaller number of villages, the reduction being represented by 10·23 per cent. and that the mortality, although higher than in 1883 by 1·62 per 1,000 of population, was lower than during 1881-1882 and the mean death-rate of 1880 83 (during which it amounted to 35·36 per 1,000) by 6·32, 1·28 and 6·14 per 1,000 respectively. The subjoined table exhibits the mortality from this cause during the five years of its prevalence in the district, during which period altogether 34·13 per 1,000 of the population was carried off by it:—

DISTRICT TOTAL ...	29 22	*27 60	30 50	35 51	26 11

The statistical inferences to be gathered from this table are—

(1) That there was a marked reduction in 1884 in the extent of country pervaded by the disease, as the percentage of villages attacked by it fell from 96, 92, 94 and 96 during 1883, 1882, 1881 and 1880 respectively, to 86 in 1884.

(2) That there was a decrease of mortality in the sub-divisions of Kishnaghur in the middle of the district, and Meherpur in the north, and an increase in the sub-division of Kushtia also in the north; while the sub-divisions of Ranaghat in the south and Chuadanga in the north maintained a more or less uniform high death-rate throughout the five years in question.

These facts indicate that the disease is gradually declining in severity; and it will also be noticed that the mortality in the towns during 1884 was considerably lower than in the rural circles, showing that they are returning to their normal health status. It is greatly to be hoped that this immunity will progress and be abidingly permanent.

In seasonal incidence, January to May were very unhealthy months with some mitigation of severity in February and May; through June to August there was a gradual decline of severity; but September to December exhibited markedly increasing activity, so much so that November and December were the unhealthiest months—December more so than November. This is, to some extent, contrary to the behaviour of the disease during the preceding years of its severe prevalence. The Civil Surgeon says that, in this district the silting up of the net-work of streamlets, which intersect in every direction the low-lying Gangetic delta land which constitutes the district, is perpetually going on on a vast scale. These rivulets are thus converted into either sand beds or chains of swamps, hollows and ditches. Another consequence of this silting is, that it tends to cause inundations in other areas along the direction these rivers may take in striking out new lines of discharge. Again, there are few properly constructed wells except in large towns, and the well water is in some places brackish. These form, in his opinion, potent causes accounting for the unhealthiness of the district. The fever in the Kishnaghur town is said to be probably due to the silting up of the old river, which ran formerly through the middle of it, joining the Jellinghi with the Churni, which has not only deprived the town of its only source of water for domestic purposes, but has also completely revolutionized its natural drainage, both surface and subsoil The former has to a small extent been remedied by providing masonry public wells, but the latter is difficult to remedy, although attempts have been made in this direction by joining, by means of a cutting, the series of low-lying

patches, swamps and tanks (which occupy most of the ancient river bed) with the two rivers which this extinct river once connected. This helps the surface drainage to some extent, and a little water also now runs along this cutting during high floods, rendering the water less impure in the hollows and tanks along the river bed. The following description of the nature and characteristics of the fever has been furnished by the Civil Surgeon:—"These fevers appear to be chiefly of a malarial nature. They are accompanied by enlargement of the spleen, progressive anæmia, emaciation, œdema, and general dropsy into serous cavities, and a tendency to recurring attacks of diarrhœa. There is frequently a scorbutic taint present, as evidenced by spongy and readily bleeding gums, thickening of subcutaneous tissues below the knee, and ecchymosis, vibices and petechiæ on the skin."

124. *Jessore.*—In this district the death-rate from fever was 22·41 per 1,000 of population in 77·18 per cent. of the villages, in opposition to 23·14 per 1,000 in 83·22 per cent. of the villages in the preceding year and 19·03 per 1,000 in the quinquennium 1879-83, indicating a diminution in both the prevalence and severity of the disease in comparison with 1883, but a considerable increase of mortality in comparison with 1879-83. January to April and October to December were the most unhealthy months, and the highest death-rates were recorded in the circles marginally cited.

The Civil Surgeon's report furnishes no explanation regarding the prevalence of the disease in any circle on this large list of high suffering areas, except that "the general cause of ill-health is the water-logging of the country by interrupted drainage," but the Magistrate, as reported last year, doubts this statement.

125. *Khulna.*—In this district the mortality from fever, although not great, was somewhat higher than during both the periods with which comparison is instituted, but there was a decrease in the area over which the disease prevailed. The mortality amounted to 18·52 per 1,000 of population in 67·40 per cent. of the villages against 17·53 per 1,000 in 78·51 per cent. of the villages in 1883, and 18·09 per 1,000 in 1879-83. The months in which the highest mortality occurred were January and October to December, and the marginally noted areas returned the highest death-rates. It was observed that the intensity of the disease was more marked in the interior of the district than in the towns, where better sanitary arrangements obtain, but the Satkhira town has a reputation of being very unhealthy, supposed to be due to the tidal khal which runs through it. The Civil Surgeon ascribes the unhealthiness of the district generally to the excessive dampness of the soil, residence in ill-ventilated and ill-drained houses, want of conservancy, bad water-supply, use of unwholesome food and water, insufficient clothing, and seasonal changes. He notes that the northern part of the Satkhira Sub-division is particularly in a water-logged condition, due to the rivers having silted up and to the drainage being defective. Doctor Ghose, the Officiating Deputy Sanitary Commissioner, Metropolitan Circles, observed during his tour in the Kalarooa thana that the silting up of khals and the obstruction to drainage, caused by the embanked road from Sonaberiah to Chanduria, was rendering many villages in the thana more or less malarious; that the health of the town of Chanduria was menaced by the action of the khals on the east and south of it; and that at Chandanpur, a part of this town, and in the adjoining villages fever prevailed to a very great extent and was due to the same cause—obstructed drainage—as the drainage of these villages chiefly passes into a khal which crosses the abovementioned embanked road and is provided with only a small masonry culvert. The water-way through this culvert is so insufficient and obstructed that during the late rains the embankment was washed away to the extent of about 200 feet or so. The flood-water had passed over, but much of the water was still confined. Doctor Ghose would not be surprised if the unhealthiness of these villages is found to date from the construction of this road. On the other hand, he found the

126. *Murshidabad.*—In this district also there was a considerable diminution in the extension and fatality of the disease, but the latter was still high. 81·97 per cent of the villages was pervaded by the disease against 91·79 per cent in the preceding year, and the mortality amounted to 20·25 per 1,000 of population, which is 1·54 per 1,000 lower than that of 1883 and 1·87 per 1,000 below that of the lustrum 1879-83. The unhealthy months were January to May and October to December, and the circles named in the margin suffered the most. In the Jungipore Subdivision, in which thannas Dewanserai (which suffered the most), Shamshergunj, Rughunathgunj and Mirzapur are situated, the water in the river Bhagirutti becomes stagnant during the hot weather, and that in the tanks is contaminated by bamboo leaves falling into it, and the soil is damp during and after the rains. Referring to the present year's health condition of the district, the Civil Surgeon, Dr. Shircore, attributes the reduction in the prevalence of fever to the raintall being deficient; but he repeats his statement of the previous year that the dampness of the ground and the humidity of the atmosphere, caused by the retention of rain water in the numerous and very extensive bhils throughout the district, the former beds of the Bhaghirutti, with high banks and no outlets, are the prolific sources of the fever in this district. The history of the last two years compared with former years corroborates, he says, this view of the matter.

Fever prevalence in the Rajshahye Division

127. The figures illustrating the prevalence and fatality of fever in the Rajshahye Division are contained in the subjoined table.—

Districts		Percentage of villages attacked by fever: In 1884	Excess or deficit compared with 1883	Mortality in 1884: Deaths	Ratio per mille	Difference in 1884 in death-rates as compared with—: 1883	1879-83	Unhealthy months

Central Districts (North)	Darjiling	28·63	8·81 D	1,322	6·46	2·58 I	8·75 I	August to December
	Julpaiguri	79·57	33·62 I	10,614	18·25	4·85 I	6·05 I	April, May, November and December
Total		84·20	15·07 I	164,366	21·25	·62 I	3·20 I	January to April, October to December

In the Rajshahye Division 84·20 per cent. of the villages was visited by the disease against 69·13 per cent. in the preceding year, and the mortality stood at 21·25 per 1,000 of population against 20·63 per 1,000 in 1883 and 18·05 per 1,000 during the lustrum 1879-83. These statistics demonstrate that a considerably greater extent of country was invaded by the malady accompanied by a rise in the death-rate in comparison with the death-rates of both the periods with which comparison is instituted, the increase in relation to the latter period being considerable, viz. 3·20 per 1,000 of population. Moreover, this division was the most unhealthy in comparison with all the other divisions of the Province, due mainly to the severe prevalence of fever in the Rajshahye and Pubna districts, but had the true death-rate of Jalpaiguri and Rungpore been exhibited, a still more unfavourable state of matters would be disclosed. January to April and October to December were the unhealthy months.

128. *Dinajpur.*—In this district with an increase in the extension of the disease was associated a decline in its fatality. The figures are: percentage of villages attacked, 85·58 against 79·93 in 1883; death-rate, 16·14 per 1,000 of

population opposed to 17·17 per 1,000 in 1883, and 17·27 per 1,000 during the quinquennium 1879-83. The months of great unhealthiness were January to March, and again November and December, and the circles named in the margin exhibited exceptionally high mortality.

The suffering in all these areas, excepting Chintamon and Pirganj, was also very great in the previous year. It is noticeable that Dinajpur thana exhibited a considerably enhanced death-rate over that of 1883 (93·52 against 71·94), but no special reason has been furnished accounting for this exceptional and continued severity of the disease in this thana. According to Dr. Mukerjee, the Civil Surgeon, Dinajpur is proverbially a fever district—in fact "the abode of fever," and has been so for years past. The mortality from this cause has, however, been steadily declining (from 21·11 in 1878 to 16·14 per 1,000 this year) from causes unknown, except with regard to the town, where continuous efforts to improve its sanitary condition has been made since 1878, when a Commission enquired, under orders of Government, into the causes of its extreme unhealthiness and suggested remedial measures. It is remarked that the death-rate from fever in the town is, contrary to the general rule, considerably lower than that in the district, in fact so much so, that although a higher mortality was returned by it, to a more or less extent, from all the other death causes, the general death-rate has been so minimised by the fever death-rate as to be lower than the district general rate. Referring to the nature of the prevalent fever, Dr. Mukerjee says that "although generally of the intermittent type, the remittent type of fever, mostly of bilious nature, with congestion of liver, or spleen, or of both, in some cases continuing to the unusual time of 42 days, were not uncommon. Some cases were also seen to have all the symptoms of typhoid fever without the characteristic rash."

129. *Rajshahye.*—The suffering in this district was pre-eminently great. It headed the list of fever-stricken districts, as it did in 1883. The disease extended over nearly the whole of the district, as 94·42 per cent. of the villages were attacked, the percentage of the preceding year being 91 43. The death-rate was very high, 30 40 per 1,000 of population, greater than that of 1883 by ·28 per 1,000 and of the lustrum 1879-83 by so much as 6·37 per 1,000. Prevailing severely in January, the disease exhibited somewhat lower fatality through February to May. June and July were months of abated mortality, but not to an extent as would entitle them to be considered as exhibiting normal health. From September there was a rise in fatal results, which continued to the end of the year, December being the unhealthiest month and November next to it. It will thus be seen that the disease was present in the district, in more or less severe form, throughout the year. In all the circles in this district excepting the Beauleah town the mortality was high, *vide* marginal figures.

It is said that in thanas Panchpur and Singra, in which mortality was lower than in 1883, the water-supply is more or less permanent and fairly good, as the Atrai and Nagore rivers collect the drainage and pour it into the bhils to the east of Nattore, but that, on the other hand, in other tracts of the district, such as the south-east portion, where the channels of communication with the Ganges are silting up and rendering the water-supply precarious and short, excepting from wells, the mortality is very high. The Civil Surgeon fears that, as in Nuddea and Jessore, this silting up process will continue until finally the interior of the district will receive no water in flood time, and he suggests that wells be now dug in certain selected places to accustom the people to their use before the climax comes. The Magistrate also believes that the silting up process is doing much mischief, for he says that the villages on the Hoja river and places situated within the outpost of Durgapur have been suffering for the last three years from epidemic fever of the most virulent type attended with

excessive mortality; and that several of these villages have been depopulated or abandoned. This fever is due to the stagnant and unwholesome water of the Hoja river and of the adjoining bhils, which condition of the water is due to the mouth of the Dhobapara khal, which joins that river with the Mooshakhan river, and of other water-ways having silted up. It appears that steps were taken during the year to open out the abovementioned khal and two of the water-ways, by which the stagnant Hoja was to some extent flushed. Other remedial action in this direction, as also for cleaning out tanks and providing for irrigation, is under consideration. In connection with the high mortality caused by the disease, the Civil Surgeon submits that the fever of the past few years has left marks in the shape of debility, anæmia, enlargement of spleen, general dropsy, &c., and this deteriorated condition of the constitution he has no doubt causes much loss of life. The comparative immunity which the Beauleah town enjoyed from the invasion of the disease is very remarkable, considering that, notwithstanding some improvements, particularly with regard to the water-supply, which were effected in 1883, very grave sanitary defects yet exist in it as recorded in the portion of this Report dealing with the prevalence of cholera in this district.

130. *Rungpore.*—In 1883 this district suffered more severely than during the preceding year, but during the year under review there was a further enhancement both in the extension and fatality of the disease; for the death-rate amounted in 1884 to 17·09 per 1,000 of population, against 15·68 in 1883, 11·49 in 1882, and 12·43 during the lustrum 1879-83, and 66·64 per cent. of the villages returned deaths in 1884, against 55·03 per cent. in 1883 and 45 per cent. in 1882. The areas cited in the margin returned the highest death-rates. In seasonal incidence the disease was greatest in January, caused less mortality during February and March, commenced to decrease in severity from April, the abatement lasting till September, when it was lowest. It became active again in October, reached maximum intensity in November, and was severe also in December. It was observed that it is in the cold weather that the poorer classes, with debilitated constitutions, enlarged spleen, and anæmia, cannot withstand the severity of the cold, and succumb to it in large numbers. It is believed, however, that many of the casualties returned under the head of fever were due to acute pulmonary diseases, which during this season attack the weak and debilitated. The true death-rate of this district is a subject of much interest in connection with the mortality of the jail at the Sudder Station, and of others similarly situated. It is a pity the Civil Officers cannot approximate more nearly to the real facts than to return a death-rate of 17·09 per mille from fever, which of course includes all inflammatory diseases.

131. *Bogra.*—In this district also, the prevalence and fatality of the disease had increased. 69·16 per cent. of the villages returned fatal cases, which proportion compared with that of 1883 exhibits an increase of 7·05 per cent. The mortality stood at 20·96, which is higher than that of the preceding year by 1·65 per 1,000, and that of the quinquennium 1879-83 by so much as 4·49 per 1,000. Exceptionally high mortality was returned by the circles named in the margin. In seasonal incidence the disease exhibited great virulence in January; from February to June it prevailed with abated severity; in July there was a rise; it was wide-spread "after the cessation of the rains in August, when the injured crops remained on the ground and rotted," and continuing to advance in severity, was most fatal during the last quarter of the year, during which the debilitated from prior attacks of the disease succumbed in large numbers. Thannas Nowabgunge and Khetlal, which suffered most, are in parts covered with dense jungle, and the drainage of these thannas as well as of Sherpur and Panchbibi, is imperfect and the water-supply deficient and impure owing to scanty rainfall and steeping of jute in it. Eating of improper food on account of failure of crops is also quoted as a cause of the prevalence of the disease.

Sherpur "	23·89	Bogra "	20·11

132. *Pubna.*—68·60 per cent. of the villages in this district was overspread by the malady against 68·50 per cent. in the preceding year, and the death-rate amounted to 27·45 per 1,000 of population, being 5·02 per 1,000 in excess of the rate in 1883 and 14·56 per 1,000 higher than during the lustrum 1879-83. Thus it is seen that with some extension of the disease there was a considerable rise in mortality. In fact this district stands third on the list of fever-stricken districts. January to May were months of great suffering, which subsided markedly during June to September, to rise again in October, and to culminate in severity in November and December. Excepting thanas Serajgunge and Ullapara, every circle in the district returned high death-rates, *vide* marginal figures. Referring to the causation of the severity of the disease generally, the Civil Surgeon says that the sudden rise of prices for food-grains in September had a disastrous effect on fever-stricken patients and other weakly persons. Defective nourishment and cold produced and kept up the complications of malarious fever. In nearly half of the dispensary patients and in a large number of the jail admissions there was found splenic enlargement and malarious cachexy. He again reports on the progressive deterioration of the health of the district. He says the mortality has risen from 9,401 deaths in 1880 to 36,011 in 1884. Improvement of registration accounts for a part of the increase, but he is of opinion that the improvement can by no manner of means explain the extraordinary rise, nor can it be attributed to any remarkable increase of the population or change in the jurisdiction of the district. It appears to him "that the same changes which have produced ill-health in the neighbouring district of Nuddea have been in operation here. The water-supply and drainage of several tracts of the district have recently been considerably interfered with by deltaic changes. In other places the steeping of jute fibre in the watercourses and tanks has been a most harmful source of pollution of water. As instances I shall bring into notice the silted condition of the Ichamutti river and the khal joining the Baral nuddi with the Dhulauri khal. The Ichamutti river, which joins the Ganges with the Brahmaputra river and runs through a very crowded portion of the district for 50 miles, had been a navigable river about 20 years ago. It is flooded now during the rains and is reduced to a series of stagnant pools during the dry season. The tract of country through which it passes, *i.e.* the Pubna and Dulai thanas, has been growing unhealthier every year. The silting of the khal between Baral nuddi and Dhulauri khal has been an occurrence within three or four years. I saw it during my inspection of a group of fever-stricken villages which have Bara Demra for its centre in thanna Shazadpore. Its condition is indescribable. It is simply the repository of all sorts of filth. All the khals I passed through during the rains were full of decomposing jute fibres. As rivers and khals are the principal channels of communication in this part of Bengal and supply important sanitary, commercial, and agricultural needs, they should be under the control and supervision of some local board or Government department." He is, moreover, of opinion that the "ill-health of the district has reached its culmination during the year under review."

Serajgunge town ...	30·13	Shazadpur thanna ...	24·55

Of local outbreaks of the disease the following may be cited. The severity of the disease in the Serajgunge Municipality, which had suffered to a limited extent in the preceding year, was great in the extreme. Not a single house was free from it. The fever was of the remittent or continued type in many cases. The bustees which suffered most are situated on low, undrained, swampy lands and surrounded by dense clumps of bamboo-bush which shut out sunlight and perflation of air. They are honey-combed with excavations which receive night-soil, cowdung, kitchen-refuse, and house-drainage. In contrast to these bustees it is remarked that the cooly lines at the Nasimpore mills, where the conservancy arrangements are very satisfactory, did not suffer from fever during the year. The Civil Surgeon records the following peculiarities connected with fever prevalence in the town of Pubna. "A number of mixed cases of fever and cholera occurred in October and November, when both these diseases were prevalent. After suffering from continued or remittent fever for 24 or 48 hours, the patients were attacked

with choleraic symptoms. In most of these cases the vomit and the motions were of a reddish tinge, watery, with much epithelial debris. Colicky pain was noticed at the commencememt in some, but it was absent in some cases. Collapse was marked in all the cases. In more than half the cases there was a recurrence of the fever. Many of these were favourable; others passed from the state of collapse to re-action; several died in the state of collapse, and several from uræmic poisoning. This was a curious mixture of two disease poisons." The villages of Bara Demra and Ratan in thana Shazadpur were reported to be suffering severely. The Civil Surgeon, who visited the localities, saw a number of spleen cases, but found the mortality to be insignificant. These villages are situated on the banks of a khal which has been silted up within three or four years; they are jungly and abound in pits and excavations containing filth, and the foot-paths are used for purposes of nature. However, in the same thana the villages of Pangashy, Ullaparah, Soobgachy, Nowpur, and Shazadpur suffered very much. These villages are also said to be very filthy. It was noted that here the poor suffered more than other classes, and that in consequence of the prevalent high prices for rice they were driven to live on " kaon, " a kind of grain.

133. *Darjiling.*—The prevalence of fever was not great in this district. Nevertheless it displayed much greater severity than during past years. Deaths were reported from 28·63 per cent of the villages against 32·44 per cent in the preceding year, and the death-rate stood at 8·46 per 1,000 of population as opposed to 5·88 during 1883, and 4·71 during the quinquennium 1879-83. August to December were the most unhealthy months, and comparatively the mortality was greatest in the Kurseong and Darjiling thanas and in the Darjiling town, where the deaths amounted to 11·43, 10·30, and 8·90 per 1,000 of population respectively. The high mortality in Kurseong is considered peculiar, as this circle is situated on the hills, much of it above the general fever level, but parts are very feverish. It was observed that a larger number of deaths occur in the hills than in the Terai, but it should be remembered that the Compulsory Registration Act is not in force in the plains. Nevertheless, Nanubari, Nuksulbari, and Matigura, which have the reputation of being the most unhealthy localities, and which are all situated in the Terai, suffered much from fever. Dr. Wood, the Deputy Sanitary Commissioner, Darjiling Circle, observes that " the physique of the plainsmen is poor. They are lanky Hindu shopkeepers, and fever is their bane. Their habits of squatting and urinating into the catch-water area of the watercourse and keeping their house-neighbourhood in a mess cannot improve their health"; but that " the physique of the Paharee population is admirable. Their health is doubtless affected by their filthy habits and occasional gorging and drinking to excess."

134. *Julpaiguri.*—In this district the disease prevailed extensively, considerably more so than during the preceding year, and the mortality was also much higher, as will be seen from the following figures :—79·57 per cent. of the villages were pervaded by the disease against only 39·95 per cent. in the preceding year, and the death-rate amounted to 18·25 per 1,000 of population as opposed to 13·40 per 1,000 in 1883, and 12·20 per 1,000 during the lustrum 1879-83. The suffering was greatest in the circles named in the margin. The severity of the disease commenced to be felt during the second quarter of the year, when the rains set in; during the third quarter its incidence was low; but during the fourth quarter, when the rains had subsided and " the water commenced to evaporate from low swampy lands and the emanation of gases from the decomposed vegetation began to rise," the disease became virulent and the mortality was very high. The fever in the Julpaiguri and Boda thanas, where it prevailed extensively, is referred to the poorer classes not having sufficient to eat owing to the high prices which obtained for food-grains, the consequence of failure of crops. In general the malarious climate of the district is quoted as causing the disease. The Duars, which are densely covered with jungle, are particularly unhealthy in this respect The Deputy Commissioner observes that the mass of the population in the district are very unhealthy. " The lower orders are

	Ratio per mille.
Julpaiguri thanna	27·40
Patgram „	22·82
Mynaguri „	22·22
Salbari „	20·89

one and all surcharged with malaria, and it is the exception to find very old men." The Civil Surgeon says that the fever of this district is easily amenable to treatment, but the people do not seek for relief till days and months have elapsed, and when the usual complications have set in, and that thus they are reduced to so low a state that asthenic diarrhœa or dysentery supervenes and death follows.

Incidence of Fever in the Dacca Division.

135. The fever statistics of the Dacca Division are furnished in the subjoined table:—

Districts.	Percentage of villages attacked by fever.		Mortality in 1884.		Difference in 1884 in death-rates as compared with –		Unhealthy Months.
	In 1884.	Excess or deficit as compared with 1883.	Deaths.	Ratio per mille.	1883.	1879-83.	
Eastern Districts. (*Dacca Division*)—							
Dacca ...	68·03	12·30 *I*	28,308	13·37	·02 *D*	2·20 *I*	January to April, November and December.
Faridpore ...	49·79	6·96 *D*	19,277	11·81	1·71 *I*	3·37 *I*	January and October to December.
Backergunge ...	60·97	3·58 *D*	9,406	15·46	·89 *I*	3·67 *I*	Ditto ditto.
Mymensing ...	50·46	9·32 *I*	26,497	8·68	·46 *I*	3·59 *I*	Ditto ditto.
Total ...	46·71	3·99 *D*	103,488	11·89	·67 *I*	3·23 *I*	Ditto ditto.

In this division fever appears to have extended, on the whole, over a less area and the mortality to have been low. The latter was however a little higher than during the preceding year, but considerably greater than during the lustrum 1879-83. The figures in support of these observations are: percentages of villages invaded by the disease, 46·71 against 50·70 in 1883; death-rate per 1,000 of population 11·89 against 11·22 per 1,000 in 1883 and 8·66 per 1,000 during 1879-83. The unhealthy months were January and October to December No deductions, however, can be drawn from such defective registration.

136. *Dacca.*—In this district 68·03 per cent. of the villages were overrun by the disease against 55·73 per cent. in 1883, and the mortality stood at 13·37 per 1,000 of population in opposition to 13·39 per 1,000 in 1883, and 11·17 per 1,000 during the lustrum 1879-83, indicating increased extension of the disease associated with almost equal mortality as contrasted with the first mentioned, but considerable increase of mortality in comparison with the last mentioned period. The local authorities state that the increment in the number of deaths recorded is due to improvement in registration. Severest seasonal suffering was experienced during January to April and again during November and December, and the highest mortality was returned by the marginally noted circles.

	Ratio per mille.
Harirampore thanna ..	25·00
Jaffergunge " ...	22·66
Nowabgunge " ...	17·12
Manickgunge " ...	17·08

In the Manickgunge Sub-division where, according to the Magistrate, fever is severe even in a healthy year, and where it is as prevalent and as fatal as in any part of Burdwan or Hughli, the most malarious thanas are Harirampur, Jaffergunge and Manickgunge, from causes which have been fully submitted in the reports of former years. Briefly summed up, they are—the general tendency towards silting up of the entire river system of the district, which while affecting the whole district, affects those thanas as well as Nowabgunge more markedly, owing to their being surrounded on all or several sides by rivers which have ceased to be navigable except during the rains, and at the same time to their being underlain by an impermeable layer of blue clay. Deficient rainfall and want of good drinking water also help to promote the unhealthiness.

137. *Faridpore.*—In this district with a reduction in the area invaded by the disease was associated an increase of mortality. 49·79 per cent. of the villages were affected against 56·75 per cent. in the preceding year, and the death-rate was 11·81 per 1,000 of population against 10·10 per 1,000 in 1883 and 8·44 during the quinquennium 1879-83. The cold months of January and

October to December were the most fatal, particularly December, and in the localities indicated in the margin the highest mortality occurred. The Civil Surgeon is of opinion that it is more the sequelæ of the fever than the disease itself which caused most of the mortality, and he can safely say that the same causes which produced fever in the Burdwan and Nuddea districts were in operation in Faridpore, viz., "saturation of the soil with moisture and organic matters from obstructed drainage, probably due to artificial obstructions, but more probably to obstruction caused by the silting up of the beds of rivers and khals, which is continually going on in this district, and which serve the purposes of deep drains in the porous soil of these districts." He adds that experience shows that inundations, particularly when they are prolonged, are unfavourable to fever; but that, on the other hand, rainfall increases fever considerably, as is very plainly seen in the western thannas, which are situated high above the level of the floods, and where fever is more or less severe in proportion to the rainfall in the second and third quarters of the year. Considerable portions of thannas Goalundo, Pangsha, Belgachi, Bhushna, Muksudpore, Gopalgunge, Palong and Faridpore are situated on the banks of large rivers—the Pudda, the Madhumatti, the Kirtinasha. Most portions of thannas Bhanga, Awanpur, Madaripore and Kotalipara are away from the big rivers. Very large portions of thannas Muksudpur, Bhushna, Awanpur, Kotalipara, Madaripore and Gopalgunge are very low and swampy, and form a chain of bhils situated between the right bank of the Pudda and the left bank of the Madhumatti.

	Ratio per *mille*.
Faridpore town	19·87
Faridpore thanna	15·96
Pangsha "	15·28

138. *Backergunge.*—In this district the incidence of the disease was identical with that in the abovementioned district, viz., decline in extension with enhancement of mortality. The figures are—percentage of villages affected 60·97 against 64·55 in the preceding year, and death-rate 15·46 per 1,000 of population against 14·57 per 1,000 in 1883, and 11·79 per 1,000 during the lustrum 1879-83. In seasonal fatality, January exhibited much severity, which abated through February to September, July and August being the healthiest months. After this, simultaneously with "the drying up of the soil and the concentration of malaria, aided by the comparatively low temperature causing chills and predisposing the native constitution to attacks of the disease," there was a steady rise, December being the unhealthiest month. The areas of greatest suffering are cited marginally. The Civil Surgeon is of opinion that the fever mortality is swollen by the inclusion in it by the ignorant chowkidars of all acute inflammatory diseases in which fever is a prominent feature. He notes that Backergunge is by no means a malarious district in comparison with the other neighbouring districts, as only mild cases of ague are, as a rule, seen, remittents or chronic malaria being rare. Moreover, out of 140 *post mortems* performed by him, it was quite exceptional to meet with an enlarged spleen. The jail statistics and the aspect of the people also support, he says, his view of this question, viz., that the majority of the people do not suffer from malaria and its sequelæ. An outbreak of great severity which occurred in Alikanda, a most unhealthy quarter of the town of Burisal, is attributed to obstruction of natural drainage caused by the want of culverts.

	Ratio per *mille*.

Gulisakhali " ...	18·10
Nalchiti " ...	18·04

139. *Mymensing.*—This district would appear to have been the healthiest compared with the others in the Dacca division, as the casualty rate amounted to only 8·68 per 1,000 of population. Nevertheless, it was higher than during 1883 by ·45 per mille, and during the lustrum 1879-83 by 3·59 per mille. Moreover, the disease prevailed more extensively than during 1883, an additional 9·32 per cent. of the villages having been attacked. The individual years which comprise the above indicated lustrum witnessed, it was observed, a steady rise in the prevalence of the disease. The most fatal months were January and October to December, and the suffering was greatest in the Pingna thanna and Jamalpore town, in which the people died at the rates of 23·18 and 20·32 per 1,000 of population. The extensive prevalence of the fever is referred for the greater part of the district, especially those parts drained

by the Brahmaputra and its tributaries, to the inundation of the rivers being, as compared with previous years, very little, so that many of the khals could not be swept out clean by it, but were left stagnating and covered with green vegetation. The lowness of the inundation this year in connection with an increase of the disease bears out, it is asserted, the oft-repeated view that the less the inundation the unhealthier the country. This condition of the khals was rendered worse by the steeping in them of jute, and the water of these khals was observed by the Civil Surgeon during his tours in August and September to be used for all purposes. In the Netrokona thanna the above general cause operated to a large extent. Thanna Ishwargunge is entirely dependent for its water-supply on the khals which intersect it, and which are in the same condition. Moreover, a large part of the district along the foot of the Garrow hills is Terai, and necessarily prone to malarious diseases. In the Guffergaon thanna many of the coolies who had flocked in large numbers to the railway works died while clearing the jungle through which the line passes. Last year it was observed that the river Brahmaputra had changed its course at about a quarter of a mile from the town, leaving only a very narrow and shallow channel close to it. This year by means of artificial obstructions placed at various points by the Municipality and the Road Cess Department at the suggestion of the Civil Surgeon, the main channel has been made to run quite close to the town. This, the Civil Surgeon observes, is a matter of great sanitary and commercial interest, but near the European quarter and the civil station there is a very large chur with low scrub on it, a very narrow branch or khal of the river intervening. The volume of water in the river was much the same in December this year as it was during the same month last year, viz. 3,027 cubic feet per second, against 2,696 cubic feet, as opposed to 4,496 cubic feet in December 1878. This condition of the river, it is believed, has influenced and will further influence the drainage of the adjoining country to a serious extent. The work of keeping the river open has been abandoned by Government since the railway was commenced. In the report of 1883 the Civil Surgeon expressed a strong opinion that the increase in the amount of fever in the sudder station is due in a great degree to the silting up of the river.

Incidence of Fever in the Chittagong Division.

140. The following statement exhibits the mortuary statistics in relation to fever of the Chittagong Division of Bengal:—

Districts.	Percentage of villages attacked by fever.		Mortality in 1884.		Difference in 1884 in death-rates as compared with—		Unhealthy Months.
	In 1884.	Excess or deficit as compared with 1883.	Deaths.	Ratio per mille.	1883.	1879-83.	
(Chittagong Division.)							
Eastern Districts. Chittagong ...	86·40	7·18 *I*	11,748	10·37	·27 *I*	1·04 *D*	January and October to December.
Tipperah ...	70·00	2·09 *I*	16,520	10·87	1·27 *I*	2·66 *I*	November and December.
Noakhally ...	73·12	1·78 *I*	12,980	15·81	2·00 *I*	1·81 *I*	January and December.
Total ...	72·96	2·85 *I*	41 248	11·87	1·11 *I*	1·25 *I*	January and October to December.

In this Division the disease appears to have overrun a greater extent of country and to have proved more fatal than during past years. 72·96 per cent. of the villages was attacked against 70·11 per cent. in the preceding year, and the casualty-rate (which cannot be said to be very severe), amounted to 11·87 per 1,000 of population as opposed to 10·76 per 1,000 in 1883, and 10·62 per 1,000 during the lustrum 1879-83. The most unhealthy months were January and October to December.

141. *Chittagong.*—The disease pervaded a very large tract of this district, and while the mortality was slightly higher than during the preceding year, it was much below that of the lustrum 1879-83. The figures illustrating

these observations are: percentage of villages affected 86·40 against 78·92 in the preceding year, and death-rate 10·37 per 1,000 of population against 10·10 per 1,000 in 1883, and 11·41 per 1,000 during 1879-83. The severity of the disease was felt most during January and October to December, but in no circle, excepting Hathazari (16·59 per 1,000), was the mortality noticeably high. The local reports do not present any information worthy of record in connection with the incidence of the disease in this district.

142. *Tipperah.*—In this district a further extension of the disease took place, and the mortality was sensibly in excess of the rates of past years. 70 per cent. of the villages was attacked against 67·91 per cent. in the preceding year, and the death-rate was 10·87 per 1,000 of population against 9·60 in 1883, and 8·21 during 1879-83. The unhealthy months were November and December, but no circle returned a conspicuously high death-rate. The Civil Surgeon, Dr. ffrench-Mullen, doubts whether the fever is attributable to malaria, which appears not to be at all prevalent in this district. His *post mortem* examinations from several parts of the district exhibited, he says, the size of the spleen very small in most bodies, and in no case was it enlarged. He believes that deaths from diseases not attended with diarrhœa or dysenteric symptoms are indiscriminately classed as deaths from fever. But, on the other hand, the district is very swampy and thickly covered with jungle, especially in the north and to some extent in the south and west. The water-supply during the dry season is also bad. It is in these places that fever mostly prevails.

143. *Noakhalli.*—The incidence of the disease in this district was identical with that in Tipperah, viz. extension of prevalence with higher mortality. The figures are: percentage of villages from which casualties were reported, 73·12 against 71·34 in the preceding year; and casualty-rate 15·81 per 1,000 of population against 13·81 in 1883, and 14·00 during the lustrum 1879-83. While the disease was most fatal in January and December, it maintained, with slight fluctuations, an uniformly high rate of mortality during all the intervening months. The circles which presented the highest death-rates are named in the margin. The fever was of a malarious type, often complicated with enlarged spleen. In connecting fever with inundations the Assistant Surgeon in charge of this district says that, the annual flooding keeps the district damp and is a prolific source of the disease. The Magistrate disagrees with him, as he finds that Sundip and Hatia, which receive as much flooding as any other part of the district, are comparatively freer from fever. It is, he says, where the water finds no egress after the rains that vegetation rots and produces fever, and that the contrary condition does no harm.

BEHAR.

144. In the Behar Division of the Province the number of casualties amounted to 301,332 in 62·55 per cent of the villages among its population numbering 23,127,104, the proportionate death-rate being 13·02 per 1,000. The records of 1883 show the percentage of villages attacked at 49·26, and death-rate at 11·29 per 1,000, and those of the lustrum 1879-83, the percentage of villages affected at 61·28, and the casualty-rate at 10·29 per 1,000. These figures demonstrate that the disease prevailed more extensively than in 1883, but less so in comparison with the lustrum 1879-83, and that the mortality was in excess of that of both the periods with which comparison is instituted, viz. by 1·73 and 2·73 per 1,000 of population, respectively. The suffering was greater in Behar than in the other divisions of the Province, Bengal excepted. In seasonal incidence the disease presented the following features:— the mortality was low during the first three months of the year, when the rainfall amounted to only ·09 inch; rose in April with a rainfall of ·48 inch, abated somewhat again in May, during which 2·35 inches of rain fell; but maintained a high rate from June to the end of the year, August and November being the unhealthiest months, the mortality in both months being the same. The aggregate amount of rain during this period was 33·60 inches.

Incidence of Fever in Behar.

Incidence of Fever in the Patna Division.

145. The fever statistics of the Patna portion of Behar are presented in the subjoined table :—

Districts.	Percentage of villages attacked by fever.		Mortality in 1884.		Difference in 1884 in death-rates as compared with—		Unhealthy Months.
	In 1884.	Excess or deficit as compared with 1883.	Deaths.	Ratio per mille.	1883.	1879-83.	
West Behar. Patna	67·14	3·95 D	25,982	14·73	1·76 I	·40 D	June to November.
West Behar. Gya	77·92	27·99 I	44,221	20·81	6·48 I	8·19 I	July to November.
West Behar. Shahabad	75·47	3·84 I	25,319	12·88	·22 I	1·99 I	August to October.
West Behar. Mozufferpore	68·80	7·03 I	22,698	8·79	·45 I	1·00 I	October to December.
West Behar. Durbhanga ...	35·96	·28 D	22,248	8·44	1·62 D	·15 I	January and November.
West Behar. Sarun	41·72	6·78 D	20,648	9·05	3·15 I	3·67 I	July to September.
West Behar. Chumparun	26·38	4·13 D	21,597	12·51	1·76 I	5·80 I	June to December.
Total ...	54·98	3·74 I	182,613	12·12	1·62 I	2·79 I	June to December.

In the Patna Division the prevalence and fatality of the disease were greater in 1884 than during the periods with which comparison is instituted ; but, on the whole, the area covered by the disease and the mortality were not inordinately large. The following figures support these observations. The percentage of villages overrun by the disease was 54·98 against 51·24 in the preceding year, the additional percentage of villages involved being 3·74. The death-rate amounted to 12·12 per 1,000 of population as opposed to 10·50 per 1,000 in 1883, and 9·33 per 1,000 during the quinquennium 1879-83, exhibiting increases of 1·62 and 2·79 per 1,000 over the rates of the two periods respectively.

146. *Patna.*—In this district the disease affected a lesser percentage of villages amounting to 3·95 per cent.; but the mortality was higher than in 1883 by 1·76 per 1,000 of population, but lower than during the lustrum 1879-83 by ·40 per 1,000, the total percentage of the villages affected being 67·14, and the total mortality 14·73 per 1,000. While present during the whole year, the disease prevailed in severe form from June to November, August being the worst month; in every circle, excepting Patna and Mokamah towns and Fatuha thanna, the death-rates were higher than during the preceding year; and the mortality was severest in the areas indicated in the margin. No explanation has been furnished accounting for the very severe mortality in the Patna thanna or for the high death-rates in the others; but the Assistant Surgeon of the Behar Sub-division observes that "the malarious fever of Bengal has gradually established itself in this part of the country. Enlargement of the spleen with its peculiar cachexia, which was almost unknown in this province, is a common disease now-a-days : neither towns nor villages are exempt from its ravages."

Massauri	"	...	16·90

147. *Gya.*—Here 27·99 per cent. of villages more than in 1883 returned casualties, and the mortality was very much higher, the excess amounting to 6·48 and 8·19 per 1,000 of population in comparison with 1883 and 1879-83 respectively. The most unhealthy months were July to November, August exhibiting the highest mortality and September the next highest. The areas of greatest mortality are those cited in the margin. The local reports do not afford any noteworthy information regarding the incidence of the disease in this district.

Gya town		..	19·78
Daudnagar thanna		...	19·72

148. *Shahabad.*—In this district also the extension of the disease was greater and the mortality higher, but not inordinate. The figures are—percentage of villages from which deaths were reported, 75·47 against 71·63 in 1883, and casualty-rate 12·88 per 1,000 of population against 12·66 per 1,000 in 1883, and 10·89 per 1,000 during the lustrum 1879-83. Excepting Mohania, in which the death-rate amounted to 16·79 per 1,000, no other circle in the district presented noticeably high mortality. As usual, the mortality from the

disease was highest during the 3rd and 4th quarters of the year, indicating that it is more fatal in the rainy season and the few months after it, when the moisture is drying up. The small increase in the prevalence and fatality of the disease this year, particularly in the Arrah subdivision, is attributed to the inundation in August from the overflow of the Sone and Ganges, which was much greater than usual. Irrigation is also referred to as causing increase of fever, but this evil is outweighed by the benefits it confers on the people by saving their crops in times of drought.

149. *Mozufferpore*, *Durbhunga* and *Sarun*.—In these districts, although the mortality (in Durbhunga excepted) was higher than during the preceding year, it was not excessive. The smallness of the number of deaths on which the death-rates are founded is no doubt traceable to defective registration. The rates at which deaths were recorded in these districts are 8·79, 8·44, and 9·05 per 1,000 of population respectively. Of these rates, that returned from Sarun was noticeably higher than those of the two preceding periods, viz. 3·15 per 1,000 in excess of 1883 and 3·67 over that of the lustrum 1879-83. The months of prominent suffering were October to December in Mozufferpore, January and November in Durbhanga, and July to September in Sarun. In none of the circles in these districts were the death-rates conspicuously high, excepting in Revilganj town and Darowali thanna in Sarun, where they amounted to 16·48 and 15·44 per 1,000 of population respectively. The reduction of mortality in the Durbhanga district is believed to be due to deficient rainfall and the drier character of the climate. The Civil Surgeon of Sarun continues to believe that the prevalence of fever in his district is ascribable to irrigation and the greater difficulty experienced in draining the country owing to the railway now forming a bund across it."

150. *Chumparun*.—In comparison with the other districts in the Patna Division, a smaller proportion (26·38 per cent.) of the villages reported deaths, and this proportion is also 4·13 per cent. lower than that of 1883; but the fatal results were greater, for the mortality of the year, amounting to 12·54 per 1,000 of population, was in excess of that of 1883 by 1·76 per 1,000 and of that of the lustrum 1879-83 by 5·80 per 1,000. The most unhealthy months were June to December, particularly November, in which month there was a sudden great rise of mortality. This abrupt increase is ascribed to the drying up of the country after the heavy rains (11·09 inches) of September. The severity of the disease was felt most in the Lowrya and Baguha thannas, and in the Bettiah town, which returned death-rates at 21 18, 17·01 and 14·15 per 1,000 of population respectively. Lowrya and Baguha, situated in the north or sub Himalayan portion of the district, are notoriously unhealthy, and suffer severely from fever every year. Although this district is extremely malarious, the Civil Surgeon doubts whether the large number of deaths recorded under the head of fever actually occurred from that malady, as he has observed that, of those who receive medical treatment, whether native or European, very few die of fever—malarious fever being one of those few diseases for which a specific remedy exists.

Incidence of Fever in the Bhagulpore Division.

151. The subjoined table furnishes this information:—

Districts.	Percentage of villages attacked by fever.		Mortality in 1884		Difference in 1884 in death rates as compared with		Unhealthy Months
	In 1884.	Excess or deficit as compared with 1883.	Deaths.	Ratio per mille	1883	1879-83.	
East Behar. Monghyr	92 35	57 58 *I*	26,427	13 41	5 11 *I*	3 32 *I*	August to December
East Behar. Bhagulpore ..	85 04	44·35 *I*	32 117	16 34	2 08 *I*	4 18 *I*	April to December.
East Behar. Purneah ..	96 49	35 36 *I*	20,698	16 06	35 *D*	·3 *I*	January to May, November and December
East Behar. Maldah	78 21	66 *D*	11 257	15 94	11 *I*	05 *D*	January to May and October to December
East Behar. Sonthal Pergunnahs	57 47	18 85 *I*	19,220	12 25	1 90 *I*	3 33 *I*	April to December
Total	74 94	28 36 *I*	118,719	14 72	1 93 *I*	2 65 *I*	October to December

The Bhagulpore or East Behar Division suffered more severely than the Patna or West Behar Division. Here 74·94 per cent. of the villages returned casualties against 46·58 per cent. during the preceding year, and the death-rate stood at 14·72 per 1,000 of population in opposition to 12·79 per 1,000 in 1883, and 12·07 per 1,000 during the quinquennium 1879-83, indicating that both the prevalence and severity of the disease were greater. The months of greatest suffering were October to December.

152. *Monghyr.*—In this district 92·35 per cent. of the villages returned fatal cases, being an increase of 57·58 per cent. over last year. There was also an enhancement of mortality of 5·11 per 1,000 as compared with 1883, and of 3·32 per 1,000 as compared with 1879-83. These results have, I believe, been brought about by the attention paid by Major Wilkinson, the Police Superintendent, to the registration of deaths. The unhealthy months were August to December, the worst being October and November. Of the circles in the district those named in the margin suffered most severely. The local reports do not furnish any information of interest relating to the history of fever in this district.

	Ratio per *mille.*

Teghra "	15·92
Monghyr "	15·29
Jamalpore	15·17
Surajgurha "	15·07

153. *Bhagulpore.*—In this district also the prevalence and severity of the disease exhibited considerable enhancement. The percentage of villages reporting deaths was 85·64, which is larger than the percentage of 1883 by 44·35, and shows that more than double the number of villages had been affected, and the death-rate amounted to 16·34 per 1,000 of population, which exceeds that of 1883 by 2·06 per 1,000 and that of the lustrum 1879-83 by 4·68 per 1,000. The months of predominating suffering were April to December, November and December exhibiting the largest number of deaths; and in the circles named in the margin the highest mortality occurred. Beyond the statement that the disease prevailed most when the floods were drying up, and that the drinking water in the Soopol thana is bad, there is nothing interesting in the local reports worthy of record.

	Ratio per *mille.*
Banka thana	22·87
Amarpur	21·60
Kumarganj or Sultanganj thana	19·71
Bhagulpur	19·34
Colgong	18·80

154. *Purneah.*—Very nearly the whole of the villages in this district returned casualties, a considerably larger number than in the preceding year, but the death-rate was somewhat lower than that of 1883, although higher than that of the quinquennium 1879-83. The figures are: percentage of villages 96·49 against 61·13 in 1883 and death-rate 16·06 against 16·41 in 1883 and 15·83 during 1879-83. The severity of the disease extended over the months of January to May, and again over November and December, the latter period exhibiting the highest mortality, and the areas of greatest suffering were those marginally cited. It is said that fever is chronic in this district, and that the tendency to splenic and dropsical complication was more marked this year; but that the reduction of mortality is referable to less rain.

	Ratio per *mille.*
Purneah town	28·63
Balrampur thana	21·61
Kishenganj	18·58
Kadwa "	17·42
Kaliaganj	17·38
Manihari "	17·13
Kusba Amour	17·19

155. *Maldah.*—The incidence of the disease in this district this year resulted in decrease in extension associated with increase in mortality, as the percentage of villages attacked by it was 78·21 against 78·87 in the preceding year, and the mortality stood at 15·84 against 15·73 in 1883 and 15·89 during the lustrum 1879-83. The months of greatest suffering were January to May and October to December, the last-named month being the worst. The Maldah and Gazole thanas exhibited the highest mortality, the death-rates returned by them being 21·96 and 20·96 per 1,000 of population respectively. The Magistrate says that the prevalence of the fever is attributable to insufficient inundation, insanitary habits of the people, and want of good drinking water in many places during the hot weather, and the Civil Surgeon adds that the fevers in this district are due chiefly to "climatic influence, malaria being prevalent everywhere."

156. *Sonthal Pergunnahs.*—The fever figures of this district indicate that there was a marked extension in area of disease united to a sensible rise in mortality, thus—percentage of villages returning deaths 57·47 against 38·62 in the preceding year, death-rate 12·25 per 1,000 of population

against 10·95 per 1,000 in 1883 and 8·92 per 1,000 during the lustrum 1879-83. In seasonal incidence the disease exhibited great severity during every month excepting the first three, October returning the largest number of deaths. The greatest suffering was experienced in the Godda and Deoghur thanas, where the mortality stood at 14·57 and 14·47 per 1,000 of population, respectively. The Deputy Commissioner observes that while a succession of dry years has led to a decrease of fever in Rajmehal, there was an increase of the malady in almost the whole of the remainder of the district. He does not think that the prevalence of fevers in this district can be attributed to stagnant water or decaying vegetation, as the country is naturally exceedingly well-drained; but he is inclined to attribute its unhealthiness to two causes, viz. "to the hills, which are distributed here and there with wide valleys and isolated hills in their midst, causing strong currents of air which are constantly increasing or decreasing the temperature suddenly, particularly during the rainy season; and to the clothing of the people not being adapted to the ever-varying temperature." He adds that the water level was excessively low and food scarce and dear, and that the registration of the depth of water in wells, which has been carried on in the district for some years, showed that in the month of October, when the water level should have been highest, it was 50, and, in some cases, 70 to 80 per cent. below the average of previous years. The current opinion is that the fever now prevalent in the district resembles the Burdwan fever, and that a wave of this fever has been travelling northward and spreading with increasing intensity each year.

ORISSA.

Incidence of Fever in the Orissa Division.

157. As usual fever prevailed less extensively and its fatality was less in the Orissa than in the other three divisions of the Province. The number of persons who succumbed to the disease was 26,523 in 47·69 per cent. of the villages and among a population enumerated at 3,628,832, and the death-rate amounted to 7·30 per 1,000 of population. The returns of 1883 show that the death-rate was 6·79 per 1,000 in 39·94 per cent. of the villages; and those of the lustrum 1879-83 give the casualty-rate at 7·10 per 1,000 in 51·09 per cent. of the villages. A comparison of these figures yields the results indicated in the margin. In seasonal incidence, January with a rainfall of ·14 inches exhibited much suffering, the death-rate amounting to ·77 per 1,000 of population. October with 6·34 inches returned an almost equal death-rate (·72 per 1,000); and in November and December, during which the mortality was highest (the casualty rates being ·84 and ·91 per 1,000 respectively), there fell only ·29 inches of rain. The death-rates during all the remaining months, while lower, were almost equally uniform, ranging from ·43 to ·56 per 1,000. The rainfall during this period amounted to 49·50 inches.

	Increase or decrease in 1884 as compared with 1883.	1879-83.
Percentage of Villages affected...	7·75 *I*	3·40 *D*
Ratio of Deaths per 1,000 of population	·51 *I*	·20 *I*

Incidence of fever in Cuttack, Poori and Balasore.

158. *Cuttack*, *Poori*, *Balasore*.—The fever statistics of these districts present no noticeable peculiarity requiring that those appertaining to each district should be separately considered: so they are submitted collectively in the subjoined table:—

District.	Percentage of Villages attacked by Fever.		Mortality in 1884.		Difference in 1884 in death-rates as compared with—		Unhealthy Months.
	In 1884.	Excess or deficit as compared with 1883.	Deaths.	Ratio per *mille*.	1883.	1879-83.	
Cuttack	57·64	21·09 *I*	15,984	8·89	1·76 *I*	·94 *I*	January and October to December.
Poori	29·59	16·53 *D*	2,612	2·93	2·07 *D*	2·64 *D*	Ditto ditto.
Balasore	48·53	6·66 *I*	7,947	8·41	·56 *I*	1·50 *I*	Ditto ditto.

The figures of 1884, taken in connection with those of the two periods with which comparison is instituted, indicate that while in Cuttack and Balasore both the extension and fatality of the disease were greater, in Poori they were lower; and that, relatively, Cuttack suffered the most, Balasore in the next degree, and Poori the least. The most unhealthy months were the same in all the three districts, viz. January and October to December; and while the mortality was sensibly high in no circle in Balasore, the highest death-rates were furnished from Poori town (8·11 per 1,000 of population) in the Poori district, and from the Aul (14·23 per 1,000), Dharmsala (13·30 per 1,000), Patamundi (9·56 per 1,000), Salipur (9·43 per 1,000), and Kendrapara (9·08 per 1,000) thannas in Cuttack. The sanitary reports from *Cuttack*, which suffered the most, furnish no information possessing any interest for reproduction here. In *Poori* the slight decline of mortality in December occurred, it is said, immediately after a partial inundation in the Gope, Pipli, Poori and Khurda thannas. The Magistrate, Mr. Barrow, notes that the people in *Balasore* being deficient in stamina owing to their living being too low both in quantity and quality, easily become a prey to fever whenever it is seriously prevalent. His account of the sanitation of the Orissa villages will be found interesting. He says that they " bear a favourable contrast to those in Bengal and Behar. The villages are generally small and the houses are scattered with numerous open fields between them, so they are not crowded together, nor have they heaps of filth in the lanes and waste places like those in Behar, nor are they thickly hidden by luxuriant growths of bamboos and low jungle, while all the neighbourhood is damp and reeking with exhalations from the numerous pits, holes and drains where all the drainage collects and lodges, as in Bengal Proper and Eastern Bengal. The soil too about here is drier, and has a frequent intermixture of sand, which appears to keep the place cleaner." It was observed by the then Magistrate, Mr. Grant, in his sanitary report for 1883, that epidemic malarious fever was spreading from Midnapore into the northern thanas of Balasore. I went to the district prepared to make inquiries into this matter, and if necessary to visit the affected thanas. From information placed before me by the Civil Surgeon, I find that the death-rate from fever in thanas Jellasore, Bustah and Baliapal adjoining Midnapore was by no means excessive, in fact did not nearly reach the rates of many districts in Bengal even by one-half, and that Chandballi thana in the south of the district suffered more from fever than Bustah in the north. The Civil Surgeon is of my opinion that no serious invasion of epidemic fever has as yet visited the Balasore district. The disease also affected the Midnapore district with diminished severity generally in 1884, but exhibited a tendency to linger in the southern thanas, where the mortuary ratios from this cause, by no means excessive, are slightly higher than in 1883, and the Civil Surgeon of Midnapore fears that in case another epidemic visitation should occur, the district will suffer right down to the sea coast. Should this occur, it is not unlikely that the northern thanas of Balasore may become involved.

CHOTA NAGPORE.

Incidence of Fever in Chota Nagpore.

159. Next to Orissa the suffering from fever was least in this Division of the Province, but the disease was more prevalent and the mortality higher in comparison with preceding periods, as the following figures show. 53,485 deaths were reported to have occurred in 1884 in 58·90 per cent. of the villages among a population numbering 4,334,178, the proportionate death-rate being 12·34 per 1,000. In 1883 the death-rate was 11·83 per 1,000 in 51·62 per cent. of the villages and during the lustrum 1879-83, 10·89 per 1,000 in 56 per cent. of the villages. The seasonal incidence of the disease did not differ from that in 1883. It prevailed with subdued severity during the first three months of the year. In April there was a great rise in mortality which was followed by three months of abated suffering. In August the disease resumed activity and reached maximum intensity in September. In October the suffering was somewhat lower than in September, but in November and December it declined markedly.

Incidence of Fever in Hazaribagh, Lohardugga, Singbhum and Manbhum.

160. The statistics illustrating the prevalence and fatality of fever in the four districts which compose Chota Nagpore are presented in the following table :—

Districts.	Percentage of villages attacked by fever.		Mortality in 1884.		Difference in 1884 in death-rates as compared with—		Unhealthy Months.
	In 1884.	Excess or deficit as compared with 1883.	Deaths.	Ratio per mille.	1883.	1879-83.	
Hazaribagh	66·97	·23 *D*	18,189	16·48	2·73 *I*	5·06 *I*	April to November.
Lohardugga	57·20	9·93 *I*	18,251	11·34	1·24 *D*	1·21 *D*	August to November.
Singbhum	67·81	5·07 *I*	6,313	11·23	1·28 *I*	1·51 *I*	April and September.
Manbhum ...	59·27	1·01 *I*	10,730	10·13	·13 *I*	1·38 *I*	April to November.

These figures indicate—(1) That more than half but less than three-fourths of the villages in all four districts were pervaded by the disease. (2) That compared with 1883, deaths were reported from a larger number of villages in all the districts, excepting Hazaribagh. (3) That the mortality was highest in Hazaribagh, next highest, but almost equal, in Lohardugga and Singbhum, and least in Manbhum. (4) That in comparison with the incidence of the disease in 1883 and during the lustrum 1879-83, there was a diminution of mortality in Lohardugga, but an increase in Hazaribagh, Singbhum and Manbhum. The seasonal incidence of the disease is exhibited in the above table, the prominent feature being that the three earlier and the last month, of the year were the healthiest in all the districts in question. April, May and June, were, however, also months of much freedom from the disease in Lohardugga. In the undermentioned circles of these districts, the disease prevailed with the most marked fatality :—

In Hazaribagh.	Ratio per *mille.*	*In Lohardugga.*	Ratio per *mille.*	*In Singbhum.*	Ratio per *mille.*	*In Manbhum.*	Ratio per *mille.*
Tandowa thanna ...	22·49	Manka thanna ...	19·61	Chaibassa town	16·81	Tooudi thanna	16·77
Hazaribagh ,, ..	21·97	Barasara ,, ...	19·09			Purulia town	16·01
Huntergunge ,, ...	21·66	Daltongunge ,, ...	17·21				
Chatra ,, ...	21·05	Garwa ,, ..	16·85				
Simooria ,, ...	20·33						
Kodarma ,, ..	19·15						

In *Singbhum* the prevalence of the disease was attributed to malaria, the country having much dense jungle. The Civil Surgeon notes that, if this cause were removed, the district will be one of the healthiest, for local causes, which contribute largely in promoting diseases in large towns and densely populated places, are absent in Singbhum. *Manbhum.*—A few cases of continued fever of distinct typhoid form were observed by the Civil Surgeon in the dispensary in the town of Purulia. Nothing special with reference to the prevalence of the disease was reported from *Hazaribagh* and *Lohardugga.*

Incidence of Fever among European Seamen.

161. *Port of Calcutta.*—The subjoined table furnishes the figures illustrating the prevalence and fatality of fevers among *European Seamen* in the Port of Calcutta during the year under review in comparison with the preceding year :—

	Admissions to hospital.		Deaths.		Ratio per *mille.*	
	1884.	1883.	1884.	1883.	1884.	1883.
Fever, Enteric	7	...	5	...	2·96	...
,, Malarious	158	323	2	4	1·18	2·15
,, Simple	297	114	...	...	...	...

indicating that enteric fever was very fatal this year; that the mortality from malarious fever had diminished sensibly in comparison with its incidence in 1883—in fact it was the lowest since 1878; and that, as usual, there were no casualties from simple fever. The Health Officer reports that 1883 was the

only year in which enteric fever was absent from the shipping, and that of the five fatal cases of this year, three were only 4 days, 2 days and 1 day, respectively, in Port before admission into hospital, having been ill on arrival, the inference being that enteric fever may be contracted at sea.

Incidence of Fever among Native Floating Population.

162. Among the *Native Floating Population* 5 deaths against 8 in 1883 from malarious fever, and 10 deaths against 14 from simple fever were recorded, the death-rate from the former disease being ·19 per 1,000 of population against ·31 per 1,000, and from the latter ·39 per 1,000 against ·55 per 1,000, indicating that the boatmen were less affected by these maladies in 1884 than during the preceding year, so far as their existence could be ascertained.

BOWEL-COMPLAINTS.

Extent of prevalence and fatality of Bowel-complaints.

163. During 1884, 58,376 deaths were reported to have occurred from bowel-complaints, the death-rate in proportion to population being ·88 per 1,000 against 55,270 deaths or at ·83 per 1,000 of population in 1883 and ·82 per 1,000 during the lustrum 1879-83. Deaths were returned from 10·61 per cent. of the villages against 9·32 per cent. in 1883. In 13 against 11 of the registering circles in the Province the maladies above alluded to prevailed with some severity, while they were absent from 21 against 18, and the remaining 615 circles against 619 exhibited no abnormal severity. These figures indicate that the disease in question pervaded a more wide-spread area, and that the mortality was at the same time somewhat greater. But, as before reported, the mortality from this class of diseases is generally under-estimated, as is abundantly proved by the jail statistics, in which, although great attention is paid to diet and to the other known causes which promote and foster the diseases, they prevail to a large extent.

Comparative prevalence of Bowel-complaints in the Urban and Rural circles

164. Of the total casualties of the year, 7,984 or at 3·24 per 1,000 of population were returned by the urban circles and 50,392, or at ·79 per 1,000 from the rural circles against 3·54 and ·73 per 1,000 in 1883 respectively, indicating that while there was a diminution of mortality in the urban circles, the rural circles exhibited enhancement—another proof that the mortuary records of the latter circles are improving.

Areas which suffered most from Bowel-complaints.

165. The districts, towns and rural circles which returned the highest death-rates from bowel-complaints are mentioned below:—

DISTRICTS.	Ratio per *mille.*	TOWNS.	Ratio per *mille.*	RURAL CIRCLES.	Ratio per *mille.*
Balasore	5·21	Revilgunge	8·72	Patna	27·17

		Monghyr	5·00	Shampur in do. ...	4·87
				Seraikela in Singbhoom	4·80

Seasonal incidence of Bowel-complaints.

	Number of deaths.		Number of deaths.
December	5,788	October	4,848
November	5.706	March	4,634
May	5,050	September ...	4,590
August	5,039	July	4,525
April	5,000	June	4,349
January	4,865	February	3,982

166. This information is supplied by the marginal figures, which show that December and November are the worst months, but with regard to the rest of the year the mortality in hot, rainy and cold months follows no rule, indicating very defective registration.

167. The marginal figures furnish this information in comparison with that for the preceding year. These figures demonstrate with regard to the *European Seamen* that less diarrhœa and dysentery prevailed among them than during 1883—in fact since 1878; that the former malady proved fatal during 1884 to the extent of 1·78 per 1,000 of population against no casualties in the preceding year; and that the latter was sensibly less severe—and with regard to the *Native Floating Population* that the prevalence of diarrhœa among them was not attended with fatal results, and that the mortality from dysentery was inconsiderable.

Diarrhœa and Dysentry in the Port of Calcutta.

	Admission to hospital.		Deaths.		Ratio per mille.

INJURY.

168. Twenty-four thousand six hundred and seventy-four casualties, or at the rate of ·37 per 1,000 of population, are reported to have been caused by violence, against 23,670, or in the proportion of ·35 per 1,000 in the preceding year, indicating that there was a small increase of mortality from this death cause. To this mortality the urban circles contributed 1,105 deaths, or at ·44 per 1,000 of population, and the rural circles 23,569, or at ·36 per 1,000.

Mortality from Injury.

169. The marginal table, in which the aggregate mortality from injury has been distributed into the different heads under which it was returned, compared with the similar information for the lustrum 1879-83, again maintains the facts that, as a rule, the largest proportion of deaths is caused by snakes and wild beasts; that accidents rank second in degree of mortality; suicides third; that wounds cause the least number of deaths; and that women are more prone to suicide than men.

Mortality from different classes of Injury.

	Suicide.				Wounds.		Accident.		Snake bites and killed by wild beasts.	
	Deaths.			Ratio per cent. to total deaths from Injury.						
	Male.	Female.	Total.		Deaths.	Ratios.	Deaths.	Ratios.	Deaths.	Ratios.
In 1884 ...	1,040	1,572	2,612	10·58	1,591	6·44	10,078	40·84	10,893	42·12
" 1879-83 ...	927	1,492	2,419	10·88	1,299	5·84	8,727	39·27	9,776	43·99

170. In seasonal incidence of casualties from violence, the law of former years is again maintained, viz. that the greatest loss of life from this cause occurred during the rainy months from June to September, as during these four months 13,782 deaths, or over 55 per cent. of the total casualties returned under the head of injury, were recorded. The reason for this has been furnished in the Reports of former years.

Seasonal incidence of Deaths from Violence.

171. *Port of Calcutta.*—Of the *European Seamen* in Port, 21 met their deaths from drowning, being at the rate of 12·47 per 1,000 of the Port population.

Mortality from Accident in the Port of Calcutta.

OTHER DISEASES.

172. From maladies which have not been considered in the foregoing portion of this Report, and which are classed under the head of "Other Causes," there were recorded 176,373 deaths, or in the proportion of 2·66 per 1,000 of population, against 152,817 casualties, or at the rate of 2·30 per 1,000 in the preceding year,

Mortality from Other Diseases.

showing an increase of 23,556 deaths. The areas in which these diseases prevailed with the greatest severity are named below :—

Mortality from Heat Apoplexy or Sunstroke in the Port of Calcutta.

173. *Port of Calcutta.*—The admissions of *European Seamen* into hospital for this malady were more numerous during the year under review than during the preceding three years, viz. 13 against 9, 5, and 4 in 1881, 1882 and 1883 respectively. Of these 13 cases, only 1 proved fatal ; but 2 deaths occurred on boardship before the subjects could be removed to hospital. Thus there were in all 15 cases with 3 casualties or at the rate of 1·78 per 1,000 of the Port population. Among the *Native Floating Population* there was no mortality from this cause, but one case was admitted into hospital and recovered.

Mortality from Scurvy.

174. Twenty-four *European Seamen* were admitted into hospital for scurvy against 14 in the preceding year. Of this number only 1 died against no casualties in 1883. Seventeen of these cases were brought in six vessels from one port alone—New York. The attention of the Shipping Master was directed to the frequency of scurvy in vessels arriving from this port. This Officer held an enquiry regarding an outbreak of scurvy in a vessel which arrived after a few months' journey. The result was that the provisions and lime-juice appeared to have been provided according to regulation, but that the quantity of lime-juice had been issued by guess, as neither the master nor the steward knew the quantity of juice contained in the imperial quart bottles. No scurvy was reported to have existed among the *Native Floating Population.*

Mortality from "Other diseases."

	In 1884.	In 1883.
Number admitted into hospital	1,248	1,169
Deaths	26	33
Ratio of deaths per 1,000 of population	15·43	17·74

175. The admissions into hospital of *European Seamen* from the maladies classed under the head of "other diseases" were in excess of the number in 1883, but the mortality was less, as will be apparent from the marginal figures. Of the 26 casualties, 7 occurred from phthisis, 5 from bronchitis or pneumonia, 3 from liver diseases, 2 from brain disease, 1 from anœmia, 1 from hæmatemesis, 1 from eye disease, and 6 were accidental deaths. The mortality among the *Native Floating Population* from the diseases grouped under the head of "other causes" was also greater. The casualties amounted to 37 or at 1·45 per 1,000 of population against 24, or at ·94 per 1,000 in the preceding year.

SECTION VII.

GENERAL HISTORY OF VACCINATION.

Year of Report.

176. The history of vaccination discussed in this Section of the Report is for the official year 1884-85.

Officers in charge of the Vaccination Circles during the year.

177. This information is submitted below:—

Calcutta.—Surgeon-Major K. McLeod from 1st to 30th April 1884, and Surgeon-Major J. O'Brien from 1st May 1884 to the end of the year.

Metropolitan Circles.—Surgeon-Major Kally Poddo Gupta from 1st April to 19th May 1884, and Dr. Kristo Dhone Ghose from 25th July 1884 to the end of the year. During the interval Assistant Surgeon Jadub Chunder Ghose, Rai Bahadoor, the Senior Deputy Superintendent, officiated.

Darjiling Circle.—Surgeon-Major J. J. Wood throughout the year.

Ranchi Circle.—Surgeon W. Owen throughout the year, excepting for two months and 28 days (25th May to 11th August 1884), when he was on privilege leave, and during which time Dr. Wilson, the Civil Surgeon of Ranchi, and Dr. Leahy, of the 17th Bengal Native Infantry, officiated.

Sonthal Pergunnahs Circle.—Dr. R. A. Barker from 1st April to 15th May 1884, and Assistant Surgeon Kally Prosonno Ghosal from 16th May 1884 to the end of the year.

Eastern Bengal Circle.—Apothecary A. Lyons throughout the year.

Behar Circle.—Assistant Surgeon Mothura Nath Sen throughout the year.

Orissa Circle.—Assistant Apothecary P. Veariah Naidu throughout the year.

178. *Strength of the Working Establishment.*

The most important of the modifications of the working Establishment which took place this year was the appointment of a separate Superintendent for the Sonthal Pergunnahs Circle. Hitherto this Circle was in charge of the Civil Surgeon of the Sonthal Pergunnahs district, who, being tied down to his Sudder Station and District work, could not discharge the most important of the duties required from the Superintendent of a Vaccination Circle, viz.,

the supervision and inspection of the work of his subordinates. This desideratum has now been supplied. The other changes disclosed in the above statement are that while, on the whole, on the one hand there was an increase of establishment of one Assistant Superintendent, 13 Inspectors and 142 Licensed Vaccinators, on the other hand a reduction took place of one Deputy Superintendent, one Head Vaccinator and 7 paid Vaccinators. Details of the changes in relation to each circle are exhibited in the margin, and the explanations of the causes which necessitated them are subjoined.

* Assistant Superintendent.

Calcutta.—On the recommendation of a special Committee appointed by the Corporation to report upon the working of the Compulsory Vaccination Act, an additional permanent Establishment, consisting of one Assistant Superintendent, seven male Vaccinators, and one female Vaccinator, the latter to be allowed Rs. 25 with Rs. 10 for conveyance hire per mensem, was appointed in order that vaccination may be carried on throughout the year. *Bovine Vaccination Department, Calcutta.*—The post of one of the Vaccinators was abolished, and that of an Inspector created, under the arrangements sanctioned by Government for rendering the Bovine Vaccination Scheme a permanent measure. *Suburbs of Calcutta.*—Ten Vaccinators for the 14 vaccine depôts having been found to be insufficient, two additional Vaccinators were, on the recommendation of Dr. Ghose, the Officiating Superintendent of Vaccination, Metropolitan Circles, who supervises the vaccination in the Suburbs, were appointed. Further strengthening and revision of the establishment of this Municipality are indicated for reasons which will be furnished when reporting on the working of the Compulsory Vaccination Act in it. *Darjiling Circle.*—One additional Vaccinator was sanctioned by Government for working on the Hills, with the view of protecting the station of Darjiling from small-pox introduced from the Plains. This Vaccinator is employed during eight months of the year. *Ranchi Circle.*—There was no actual increase or decrease of Establishment, but as eight of the Vaccinators were deputed to do duty, two as Native Superintendents and six as Inspectors, they have been shown under the superior service heads. This arrangement also accounts for the reduction seen under the head of Vaccinators. With regard to the Head Vaccinator, the post fell vacant, and was not filled up. *Sonthal Pergunnahs Circle.*—A separate Superintendent having been appointed, it was deemed inexpedient to retain the Deputy Superintendent, and his services were therefore dispensed with. *Eastern Bengal Circle.*—It having been arranged to extend the Licensed Vaccination System in the Mymensing district, two additional Inspectors were appointed under orders of Government to supervise the work of the Licensed Vaccinators in that district. This arrangement necessitated the entertainment of 30 additional Licensed Vaccinators. The reduction of one paid Vaccinator has not been accounted for. *Behar Circle.*—In this Circle also it was arranged to extend the Licensed Vaccination System to the Patna district, and two additional Inspectors were appointed for the same purpose as in the Eastern Bengal Circle, 83 licensed vaccinators being placed under them. There was no actual increase of paid Vaccinators. The three additional men shown in the table belong to the sanctioned Establishment; they were retained during this, but not during the preceding year.

With reference to the increase and decrease of Licensed Vaccinators shown in the above table, it should be stated that their strength fluctuates according to the requirements of each year.

179. *Municipal Area.*—The above table shows that the services of Licensed Vaccinators are beginning to be utilized in this area, as 27 of these men were employed in some of the Municipalities.* I should consider the scheme by which vaccination is rendered self-supporting in Municipalities a move in the right direction; but the Civil Surgeon of Chaibassa (one of the Municipalities in which a licensed vaccinator was employed) does not consider the arrangement a satisfactory one, because the vaccinator can do as he likes, work or not work, and because the fees charged fall heavily on families with a large number of children. He advocates free vaccination for the poorer classes, who can then have no excuse for objecting to have their children vaccinated.

180. A brief account of those of the Vaccination Establishment who were favourably mentioned in the reports, and of those who were punished for grave misconduct, is subjoined. The conduct of the rest of the Establishment, excluding also those who were found guilty of ordinary offences, was, on the whole, good.

Conduct of Establishment.

Calcutta.—The Superintendent of this Circle reports that "the conduct of the Deputy Superintendent [Assistant Surgeon Ram Chunder Mitter] was highly satisfactory. He carried out his duties with energy and discretion. I have found his knowledge of the town, and of the various classes of people who inhabit it, most useful in all questions relating to vaccination and the working of the Compulsory Vaccination Act." The Superintendent also gives much credit to Civil Hospital Assistant Amrito Lal Roy, the newly-appointed Assistant Superintendent, for intelligence and hard work, and for ably assisting the Deputy Superintendent in carrying out his multifarious duties. Head vaccinator, Juggodish Chuckeravarti, has also been commended for performing his duties satisfactorily, and keeping his books in excellent order. *Metropolitan Circles.*—The Officiating Superintendent, Dr. Ghose, reports that Assistant Surgeon, Jadub Chunder Ghose, Rai Bahadoor, Deputy Superintendent, is "an officer of experience, who worked with his usual method and completeness. He commanded the respect of the men under him, and his inspection was thorough;" that Assistant Surgeon, Jogendro Nath Bhuttacharjee, formerly in charge of Bovine Vaccination in Calcutta, and at present working in the same capacity, and as Deputy Superintendent of Vaccination in the Suburban and Howrah Municipalities, "worked with untiring zeal and devotion," and that he is an officer possessing special aptitude for the department, and deserving of special notice by the Sanitary Commissioner; and that the head clerk, Babu Gopal Chunder Mazoomdar, "who has been 17 years in the service, is a man of great merit, and in fact the only clerk in the office who can write and understand English and the office work." Two inspectors were dismissed for negligence and gross misconduct, and the 10 vaccinators in the Suburban Municipality were found by Dr. Ghose, on his assuming charge of his office, to be working entirely in their own way, seldom attending the depôts, vaccinating children as they come across them, charging fees, but rarely crediting them to the municipal funds, ignorant of the rules and requirements of the Compulsory Vaccination Act, and such an apathetic and dishonest lot that as soon as the Superintendent insisted on their performing their duties properly, and vaccinating the people free of charge, six of their number either resigned or had to be removed for persistently obstructing work. In the *Ranchi Circle* the Superintendent has had, as in former years, to contend with almost insurmountable difficulties in progressing with vaccination, owing to gross misconduct on the part of a large number of his subordinates from the clerk downwards. When he assumed charge, the circle was in a disorganized condition, all discipline being conspicuous by its absence. Since then the same story of inefficiency, neglect of duty, disobedience of orders, impeding of work, irregularities in the matter of fees, quarrels, assaults, &c., with their train of punishments, such as warnings, suspensions, dismissals, is repeated yearly, good conduct on the part of any of

the establishment being rare. Moreover, this year, an entire party of vaccinators resigned, because the Superintendent did not himself take notice of an assault alleged to have been committed by a chowkidar on one of their number, but referred them to the Criminal Court for redress, the fact being that the chowkidar himself was assaulted by one of them. This continued struggle is, besides being irksome in the extreme, a great bar to the progress of work, and it is only due to Dr. Owen being always among his men, controlling them with a strong hand, and exercising great tact, that vaccination has not fallen through in the Ranchi Circle. In the *Eastern Bengal* Circle Native Superintendent Dinabundhu Roy, having received three dozens of lancets, returned only two dozens into store, stoutly maintaining, even in the face of his own receipt acknowledging the entire number, that he had received only two dozens. He, moreover, having received Rs. 9-9 from some vaccinators for lancets lost by them, credited only Rs. 5-4 and retained the difference, representing excess payment above the value of the lancets. He was dismissed after the price of the unreturned lancets had been recovered from him, and he had been directed to refund the excess payments to the vaccinators. In the *Orissa* Circle head vaccinator Amos Mohanty is said to understand his work thoroughly, and to have given satisfaction, his services being much appreciated by the Madhupur Rajah and other zemindars "owing to his kind way of handling and vaccinating people in the villages," and head vaccinator Ram Lall Dey is reported to be a hard working man and active in his movements, being a good walker.

I am not quite satisfied with the work of some of the Superintendents and most of the Deputy Superintendents in the department. My reasons for dissatisfaction will be furnished in a subsequent portion of this Report. I have already spoken of the good work performed by Dr. Owen, the Superintendent of the Ranchi Circle, and it gives me great pleasure to record here that the manner in which Dr. Ghose, who officiated during the year as Deputy Sanitary Commissioner and Superintendent of Vaccination, Metropolitan Circles, discharged his duties is beyond all praise. He is a most energetic, conscientious, and careful officer of high administrative ability, the loss of whose services in the Sanitary Department is much to be regretted.

Areas vaccinated, and Plans which determined the conduct of Operations.

181. A summary of the information required under this head is subjoined.

182. *Calcutta.*—The subject of vaccination attracted much public attention during the year under review, and a special Committee was appointed by the Corporation to report upon the working of the Compulsory Vaccination Act. On the recommendation of this Committee a permanent establishment was appointed to push on and maintain vaccination throughout the year, to arrest the progress of an unusual prevalence of small-pox which was present in the hot weather, and to forestall the possibility of a severer outbreak in the cold weather. In other respect the work was carried on in the manner reported in former years.

183. *Metropolitan Circles.*—In this Circle the unit of work is the area of an Inspector's jurisdiction, of which there are 39, and several of these jurisdictions are amalgamated to form a Circle, of which there are four—thus: the first Circle consists of 10 Inspectors' jurisdictions, comprising 45 thanahs; the second Circle, 11 Inspectors' divisions, containing 55 thanahs; the third Circle has 12 Inspectors' divisions with 48 thanahs; and the fourth Circle, six Inspectors' divisions, comprising 35 thanahs. The four Circles contain the 183 thanahs in the 11 districts of the Burdwan and Presidency Divisions, and each Circle is under the superintendence of a Deputy Superintendent, and the operations are conducted by Licensed Vaccinators, of whom there were 343 in 1884-85. It will thus be seen that the work is systematically and judiciously distributed over the entire area, which goes by the name of the "Metropolitan Circles." During the year under review vaccinations were carried on in every thanah, excepting a few, which were considered to have been completely protected during the preceding year. Again, in some thanahs in Burdwan, Birbhum, Murshidabad, and Bankura, work was abandoned as soon as it was commenced, owing to scarcity of food in them caused by failure of crops. In the subjoined table are shown in detail the working areas, the staff employed, and the amount of work produced during the year under notice, as compared with the results of the preceding year:—

Circles.	Deputy Superintendent in charge of the Circles.	Districts.	Number of inspectors, 1884-85.	Number of licensed vaccinators, 1884-85.	Number of operations performed. 1884-85.	1883-84.	Difference.

		Bankura	2	57	20,883	20,865	18 *I*
		Total ...	6	117	72,146	52,513	19,633 *I*

On the assumption that the distribution of the vaccinating staff employed was compatible with the requirements of each Circle, these figures indicate that the most satisfactory work was performed in the first Circle, and next in point of merit in the fourth Circle. On the other hand, the work in the second Circle has retrograded to a very serious extent, the total reduction amounting to so large a number as 20,509 operations, and all the three districts in this Circle sharing in the recession. This falling off can partly be accounted for by the intermission of work in the Murshidabad and Birbhum districts owing to distress from failing crops; but this cause does not apply to Nuddea. The figures of the third Circle show an increase of operations in the Hughli and 24-Pergunnahs districts, with decreases in the Burdwan and Howrah districts; the increment placed against the decrement yielding a net decrease of 3,331 operations performed. In this Circle distress prevailed in Burdwan, but not in Howrah. From the Diary of the present Deputy Superintendent of the fourth Circle, it appeared that during the incumbency of his predecessor very grave irregularities existed in the conduct of vaccination in the Midnapur district. Registers were not kept up; Inspectors neglected their work; cases of opposition to vaccination were not properly attended to by the Deputy Superintendent; and Inspectors and Vaccinators worked jointly instead of having specific areas allotted to them.

184. In the *Suburbs of Calcutta*, which also forms a part of the Metropolitan Circles, the operations were carried on in the whole area which forms the Municipality. As the Compulsory Vaccination Act is in force in it, the mode and plan of work followed in it will be described in the part of this Section of the Report which deals with the manner in which this Enactment was worked.

185. The field of work in the *Darjiling Circle*, in which operations were conducted by the Government and Licensed agencies, is identical with that taken up in the preceding year. The strength of the staff employed and the outturn produced by it are presented in the subjoined table. Cooch Behar is not included in this account, as vaccinations are carried on there under local arrangements :—

Superintendent.	Government Agency. Areas in which Operations were carried on.	Number of Inspectors.	Number of paid Vaccinators.	Total number of Operations performed. 1884-85.	1883-84.	Licensed Agency. Deputy Superintendents in charge.	Areas in which Operations were carried on.	Number of Inspectors.	Number of licensed Vaccinators.	Total number of Operations performed. 1884-85.	1883-84.
Surgeon-Major J. J. Wood.	Darjiling thanah ...	One head vaccinator for all the areas.	4	13,316	14,142	Moulvie Tajumul Hossein.	Dinajpur	2	30	35,134	34,581
	Kalimpong Sub-division		1				Purneah	2	31	45,371	36,537
							Julpaiguri	1	19	13,693	16,853
							Maldah	1	18	19,227	17,239
							Terai, portion of Darjiling	...	2	1,825	2,379
	Kurseong thanah ...		1			Assistant Surgeon Narendro Nath Gupta.	Rajshahye	2	28	34,967	37,539
							Rungpur	2	30	46,582	43,829
							Bogra	1	16	19,443	18,457
	Total ...	..	6	13,316	14,142		Total ...	11	174	216,244	207,894

The figures indicate that with an increase on the whole in the work of the Licensed agency there was some falling off in that of the Government agency. Considering the work in each district assigned to the Licensed vaccinators, Rajshahye, Julpaiguri and Terai portion of Darjiling are found to have fallen off very much in operations performed, which is traceable in the absence of explanation to less diligence exhibited by the staff.

186. In the *Ranchi Circle* the Palamow sub-division of the Lohardugga district was assigned to the Government vaccinators, and the Singbhum (excluding the Kolhan and including Dhalbhum), Manbhum, Hazaribagh and Lohardugga districts, and the Political States of Sirguja, Jushpore and Gangpore to the Licensed vaccinators. The particular areas in these districts, which were taken up, the distribution of the vaccinating staff over them, and the work performed by them, are shown in the subjoined tables:—

Government Agency.

Areas in which Operations were carried on.	Number of villages.	Number of Inspectors.	Number of Vaccinators.	Number of Operations.
Garwa thanah, half of Bhowthpur outpost of Hosseinabad thanah and Daltongunj thanah.	835	Inspector Shunkar Lall.	10	18,901
Remainder of thanah Hosseinabad, with exception of 12 villages to the south and east.	232	Native Superintendent Mitra Lall.	10	3,403
Ranka thanah, outpost Bhundariya, Baresand thanah, Manika thanah, Tanki outpost of Daltongunj, Manatu outpost of Patan thanah and Chatarpur thanah.	914	Native Superintendent Fazal Karim.	10	11,921

No comparison can be instituted between this and the preceding year's work, with the view of gauging the activity of the men in performing it, as the abovementioned areas are different from those which were taken up by the Government vaccinators in 1883-84. It should, however, be mentioned that the very small number of vaccinations (3,403) performed by the second batch of operators exhibited in the above table is entirely due to the work having been stopped on the 15th December, owing to the vaccinators having resigned for reasons explained in paragraph 180 of this Report. As a matter of fact, however, the perfunctory manner in which the vaccinating staff in this circle perform their work generally cannot yield good results.

Licensed Agency.

Districts.	Areas in which Operations were carried on.	Supervising Officers.	Number of Vaccinators.	Total number of operations performed. 1884-85.	Total number of operations performed. 1883-84.
Manbhum ...	Thanahs Purulia, Barabhum, Patkom, Jhalda, Baghmoondi, Jaipur, Para, Raghunathpur, Nirsha, Govindpur, Gourandi, Manbazar, Ichaghur, Topechanchi and Chass.	....	38	31,298	32,765

	Thanah Kharsowan	....	2		
Lohardugga ...	Thanahs Silli, Ranchi, and Mandar or Choreya ...	Mahomed Ali, vaccinator.	10	26,264	2,751
	Thanahs Ranchi, Kara, Sisoi, Khunti and Tamar ...	Luchmun Sahi, vaccinator.	15		
	Thanahs Barway, Balumat, Lohardugga and Mandar	Nakheed Lall, vaccinator.	12		
Political States ...	Sirguja, Jushpur and Gangpur	....	40	20,210	25,200

A considerably reduced number of operations were returned by the vaccinators of the Manbhum, Hazaribagh and Singbhum districts, in comparison with the results achieved in the same areas during the preceding year, indicating great laxity on their part. The large amount of work done this year by the Licensed vaccinators in Lohardugga is not susceptible of comparison with the small number of operations performed in 1883-84, as this number represents work done during the recess by the Licensed vaccinators, the major

portion of the vaccinations in the district having been performed by the Government agency. In order to meet the prejudices of the people against Mahomedan operators, the Superintendent again took care to see that almost the whole of the Vaccinators consisted of Bengalis, Up-countrymen, Sudhras, Kyesths, Aroans, Rajpoots, Quiries and Brahmins—the number of Mahomedan operators being reduced to 13. There were also two Christian vaccinators.

187. In the *Sonthal Pergunnahs* Circle the undermentioned areas were taken up by the Government and Licensed agencies respectively:—

GOVERNMENT AGENCY.

Districts.	Areas.	Number of Vaccinators during: Working season.	Recess.	Number of Operations performed.
Bhagulpore.	Kotareah	6	......	3,833
	Umerpore	6	4	7,711
	Banka	6	4	5,922
	Kotowalli	12	6	4,502

	Deoghur	5	3	7,910
	Jamtara	6	2	8,758
	Modhupore	4	1	2,303
	Sarat	3	1	4,493
	Total ...	79	22	64,223
Bhagulpore.	Soopole Sub-division / Muddehpurah do.	4	......	3,093
	GRAND TOTAL ...	83	22	67,316

It will be noticed that in almost all the areas named in the above table vaccination was carried on during the whole year. The cause of carrying on operations during the recess was the existence of small-pox in the areas in question during that period. The disease has been prevailing severely and persistently in this Circle, particularly in the Sonthal Pergunnahs, Monghyr, and Bhagulpur districts, for the past three years without having yet been eradicated, notwithstanding the retention for this purpose of a costly establishment during the recess seasons of those years. An examination of the above figures shows clearly that the work performed by the vaccinators during the year under review was insufficient and relatively very disproportionate, and as the same observations apply to the work of the two preceding years, the total vaccinations* during which did not differ strikingly from those of this year, it is not to be wondered at that the disease has not yet been subdued. A considerably greater amount of energy and systematic working must be brought to bear on the matter before a satisfactory result can be expected.

		Number of Operations
* In 1882-83	...	134,571
„ 1883-84	...	106,985
„ 1884-85	...	123,048

188. The *Government* and *Licensed* agency in the *Eastern Bengal* Circle undertook the vaccination of the areas indicated in the subjoined table:—

GOVERNMENT AGENCY.

Districts.	Native Superintendents.	Head Vaccinators.	Paid Vaccinators.	Apprentices.	Number of Operations during 1884-85.
Tipperah	......	6	65	29	154,268
Noakhali	1	1	26	14	52,413
Dacca	} (Recess work)		1	......	2,828
Backergunj			......	......	900

LICENSED AGENCY.

Districts.	Inspectors.	Native Superintendents.	Licensed Vaccinators.	Number of Operations during 1884-85.
Dacca	1	......	51	40,125
Faridpur	1	......	41	38,717
Pubna	1	......	33	29,772
Mymensing	2	......	71	70,764
Tipperah	1	... ..	15	7,013
Noakhali	......	1	3	270

In Tipperah operations were carried on in all its 11 thanahs, viz., in Daudkandi, Hajigunge, Choudagram, Chandpur, Laksham, Chanduria and Kasba by the Government vaccinators, and in Muradnagar, Brahmanberia, Comillah, Nobinnagar and Barakampta by the Licensed agency. In Noakhali only two thanahs—Begumgunge and Ramganj—were operated on by the latter agency. One thousand seven hundred and forty-one of the operations in Dacca represents recess work, and with regard to the presence of Government vaccinators in it, when it has been for a long time worked under the Licensed System, the Superintendent writes:—"A chur in the Munshiganj thanah of the district of Dacca, which has always resisted the introduction of vaccination, has in part yielded this year. This is an example showing that vaccination advances with familiarity when it is not opposed by unsurmountable religious bigotry, and this I am bound to say is not a solitary instance in my experience. The men of these churs (who market across the Megna river) finding the Mahomedans in thanah Hajigunge accepting vaccination, got over their scruples, and a considerable number have received the protection, though a great many still remain obdurate. These very people resisted vaccination from its first introduction into the district so far back as 1872." The few operations in the Backergunge district represents work done during the recess. Every thanah in the Dacca, Faridpur, Mymensing and Pubna districts was under operation by the Licensed agency, and a little work was also done by it in thanahs Sudharam and Bamni in Noakhali.

189. The work in the *Orissa* Circle is done entirely by Government vaccinators, the Licensed System not having yet been introduced into it. The operations were carried on this year in the thanahs in the Cuttack and Puri districts, in the Tributary States, and with the Establishment indicated in the following table:—

Districts.	Thanahs.	Number of villages.	Supervising Officers.	Vaccinators.	Apprentices.	Number of Operations performed.

	Total ..	1,364	3	29	4	33,545
PURI ..	Sonapadar outpost in Khurda Sub-division	148	......	2	......	3,648
	Brahmagi outpost in Sudder thanah ..	68	......	4	......	2,043
	Total ...	216	......	6	.....	5,691
	Mourbhunj	102	1	3	......	6,135
	Baramba	52	......	1	......	1,573
	Atgur (Chogan, a Native Christian village)	4	......	1	......	27
	Total ...	158	1	5	......	7,735
	GRAND TOTAL ...	1,738	4	40	4	46,071

The actual work of the year was conducted in the unprotected areas of the Cuttack district, in order that this district may be prepared for the reception of the Licensed System of operations, which is proposed to be introduced into it at the next working season. Vaccination was carried on in the areas in the Puri district named in the above table, because small-pox had broken out in them. The Tributary States also received protection to some extent, and the Native Regiment stationed at Cuttack was vaccinated with lymph supplied by the Superintendent of this Circle.

190. The subjoined table shows the distribution of operations in the *Behar* Circle :—

Government Agency.

Districts.	Thanahs.	Head Vaccinators.	Vaccinators.	Number of Operations.

In the Shahabad district in only thanahs Arrah and Peru operations were carried on during the preceding year, the remaining thanahs named above were taken up for the first time this year. The Patna district having been pronounced in 1883-84 to have been thoroughly protected, with the exception of a few outlying villages, the Licensed System of vaccination was introduced into it during the year under review. With regard to the Mozufferpur district in this Circle, which has not yet been touched by vaccination, the Magistrate, Mr. Marindin, submits the following observations :—"I believe many Indigo-planters keep a dispensary, and give medicines and medical assistance to their ryots and factory hands, and I would suggest the plan of furnishing any of these gentlemen, who would undertake the work, a supply of lymph. The operation is a simple one, and if we could enlist the services of the Planters, a ready means of extending vaccination throughout the district, at all events among the lower castes, presents itself. I have not yet spoken to any of the Indigo-planters in the matter ; but, if my idea commends itself to the Sanitary Commissioner, I will do so, and report the result. It certainly is in the interests of the planting community to help Government in keeping down the ravages of small-pox." No immediate action can be taken on this suggestion, but when the district is taken up by the Government agency, no effort should be spared to enlist the assistance and sympathy of the Planters to aid in vaccination. Dr. Mathew, the Civil Surgeon, does not look forward with much hopefulness to the success of vaccination in the immediate future.

Plans which determined the conduct of Operations in the *Municipalities.*

191. During the year under review, vaccination was conducted in 46 Sudder Municipalities, including four Cantonments, 99 outlying Towns and 15 Dispensaries. With a few exceptions, in which the surrounding villages were taken up, operations were carried on within the jurisdictions of the Municipalities and Towns. As usual, the work in the Dispensaries was confined to those who came to them to be vaccinated. Apart from the abovementioned institutions, 6,491 vaccinations were performed by 27 operators in the following places, which are included in statement No. III in Appendix V showing the municipal work, viz., to the prisoners in the jails of Motihari, Noakhali, Jessore, Khulna, Rajshahye, Julpaiguri, Faridpore, Arrah and Mymensing (including the Police) by the Medical Officers in charge of them ; to the children on the line of Railway from Sara to Silliguri by a licensed vaccinator paid by the Northern Bengal State Railway authorities ; to the boys in the zillah school in the Mymensing Municipality by the Civil Surgeon ; to the employés in the tea gardens at Kurnafooli by a vaccinator paid by the Kurnafooli Association ; to children in the neighbourhood of the Somastipur Railway Junction, and to the workpeople

in the Indigo factories at Hatouri, Ilnasnugger and Pamdoul under the superintendence of the European managers, with lymph supplied by the Civil Surgeon of Durbhunga; to people in the Ullapore pergunnah in Durbhunga in 62 villages, within a radius of 10 miles, and to those who reside near the Naraya dispensary by two vaccinators paid by the Maharajah of Durbhanga; to people who resorted to the Hutwa, Bhori, and Gopalgunge Dispensaries in Sarun and in the surrounding villages, by four vaccinators paid by the Hutwa Raj; to the Angul Estate in Cuttack by two vaccinators paid by Government; to the employés at the Jamalpur Railway station by two vaccinators employed by the East Indian Railway Company; and to people in the Dhenkanal Tributary Mehal in Cuttack within 20 miles on the north and south of the ghur (fort) by two vaccinators paid by the Estate, the object being to familiarize the people to the measure, so that inoculation, which is largely practised in this jungly place, may be suppressed. The subjoined statement shows the number of operations which were performed in the institutions and places above referred to:—

AREAS.	Number of Operators.	Number of Operations performed.
Sudder Municipalities	87	46,413
Outlying Towns	109	32,339
Dispensaries	23	2,812
Jails	11	243
Other places	10	4,229
Total ...	240	86,036

192. Finding that Civil Surgeons could not give the required attention and supervision to vaccination in outlying Municipalities, even if they could do so with regard to the Municipalities at the head-quarters of districts where they are located, I submitted the question to Government, and obtained sanction to place vaccination in the Sudder Municipalities under the Civil Surgeons; that of outlying Municipalities to which Assistant Surgeons are attached under those officers, and that of all other Municipalities removed any distance from the head-quarters, and not easily accessible by rail under the Superintendents of the Vaccination Circles; the returns of the Sudder Municipalities being submitted to this office, as hitherto, by the Civil Surgeons, and those of Municipalities under the Assistant Surgeons and of Vaccinators of all the other Municipalities through the Superintendents of Vaccination of the Circles in which they are respectively situated. A list indicating the distribution of the Municipalities under the above arrangements was circulated, and the scheme, under which the responsibility of vaccination in Sudder Municipalities is vested in Civil Surgeons and of all the other Municipalities in Superintendents of Vaccination, and which applies to all Municipalities, excepting those situated in the Behar and Orissa Circles, where vaccination is not yet sufficiently advanced, and to those districts where the Circle System of vaccination has not yet been brought into operation, was given effect to during the year under review.

Revised Scheme for the control and supervision of Vaccination in Municipalities.

Dr. Ghose, the Officiating Superintendent of Vaccination, Metropolitan Circles, who paid great attention to the 42 Municipalities placed under his supervision, reports that he is not satisfied with the arrangements obtaining in most of them, and that he had many drawbacks to contend with in supervising the work, the chief being that the Municipal Commissioners did not seem to recognize their responsibility with regard to vaccination, and grudged the expense for carrying it on; that the vaccinating staff in these Municipalities were not familiar with the working of the Compulsory Act; that several Municipalities could not afford to employ a permanent vaccinator, and it was difficult to procure industrious and good men for one, two, or three months only, the result being that incompetent men were entertained, this being especially the case in the Municipalities in the Bussirhat Sub-division; that in many Municipalities vaccine stations, as required by the provisions in the Compulsory Vaccination Act, could not be established owing to the municipal area being too large for one vaccinator; and that in most Municipalities,

where vaccinations were carried on for a very short time, the operations could not be inspected conveniently at the proper time. The operations were supervised, in most of the Municipalities placed under the Superintendent, by the Deputy Superintendents and Inspecting Vaccinators of the divisions in which they are located. Dr. Ghose inspected 2,818 operations in these towns and found them successful.

DEGREE OF PROTECTION AFFORDED IN THE VACCINATION CIRCLES.

Degree of Protection in *Calcutta*.

193. Vaccination was as usual carried on throughout *Calcutta*, no ward in it escaping the application of the measure, but still it cannot be said that the Metropolis is thoroughly protected. Those sections of it which are inhabited by Europeans and the permanently fixed Native population are better protected than those in which the population is a floating one, and where up-country people reside, particularly in Barabazar and Jorasanko. Here it is extremely difficult to get information of unprotected persons and children. The number of deaths from small-pox during 1884-85 amounted to 394, or at ·90 per 1,000 of population, against 193, or at ·44 per 1,000 in the preceding year, the average of the lustrum 1879-80 to 1883-84 being ·39 per 1,000, indicating that the Metropolis needs a great deal more protection, and I am convinced of this by personal observation.

Degree of Protection in the *Metropolitan* Circles.

194. On this subject Dr. Ghose, who officiated as Superintendent of these circles during the major portion of the year, writes:—"It has been customary in these reports, year after year, to say that all these districts have been thoroughly protected. But the statistics bear internal evidence of the fact that it is not so, for among those vaccinated during the year a large number (67,439) were above six years of age. In every part of the country I visited, I found a village here and a village there that has up to this successfully resisted vaccination, and there is scarcely a village in which one or two families have not done the same. When outbreaks of small-pox occur, the existence of these unprotected villages, or groups of families in a village, come to light. In one outbreak in the Howrah district so many as 63 fell victims to the disease before the locality could be protected. In the Kushtea bazar, where the Compulsory Vaccination Act was in force, so many as 38 unprotected persons existed to get small-pox on the arrival of a Kabuli fruit-seller with the infection. I have collected a list of the villages in some of the districts in which the whole or a large portion of the inhabitants are still unprotected, and are still successfully resisting vaccination. They are situated in—

Midnapur	356	Khulna	59
Bankura	40	Hughli	40
Nuddea	23	Murshidabad	56

This is not all in the districts mentioned, and I have not yet been able to collect the lists of other districts in the Circle. But, generally speaking, Midnapur is the worst district in this respect. In it there are groups of villages, specially in the Sabong thanah, which are still unprotected. But every year a few of the objecting villages are being overcome, but at the rate of progress now being made in this direction, it will take years to complete the thorough vaccination of these circles in the strict sense of the word." In his Diary for February 1885, Dr. Ghose reports:—"Jagool and Baliapota in the Keshpur thanah (in Midnapur) were never visited by a vaccinator before, and small-pox was a regular visitor. A large number died from it three years ago, which is fresh in the memory of the people, and this year, on the appearance of the disease, they invited the vaccinators working in the Midnapur thanah, on the opposite bank of the river, and got the whole village vaccinated. The small-pox was thus most effectively stamped out; the number of attacks did not go beyond three, although the unprotected individuals numbered 148." To Dr. Ghose's statements the following observations of Dr. Roy, the Civil Surgeon of Birbhum, give much support. He writes:—"From the constant complaint that reaches me from the Licensed Vaccinators about the realization of their fees, I am convinced that under the new system [Licensed] thorough vaccination cannot be afforded, inasmuch as it is not likely to reach the poor and the needy, who, encumbered as a rule with ever multiplying numbers of children, have no means to satisfy the demands of the

vaccinators, who are paid by their work. Thus there are left here and there foci of unprotected spots, that in unfavourable seasons must contribute their quota of deaths. Vaccination is a tree of recent growth in India. To leave the tender plant to be supported by the mercy of the people will be to stifle its growth and jeopardize its credit. I beg to question very much the advisability of the system that leaves an important life-protecting measure to be supported by an unenlightened public, with the view of showing an insignificant saving to the Government exchequer. To say the least, it is an economy misdirected and premature in its adoption. The statistics marginally given serve to illustrate Dr. Roy's view of the matter, but perhaps not so unfavourably as might be expected.

195. Dr. Ghose finds that the number of births registered in the *Suburbs of Calcutta* during the year under notice was 4,999; that of this number 1,663 died; and that contrasting the balance—3,336—with 1,819, the number of children under one year who were vaccinated, 1,517 infants born were left unprotected, irrespective of the number who escaped registration, and of the number who came in from other parts of the country. Referring to the adults, he reports that of 122 cases of small-pox which came under notice, 85 were adults, and 63 of this number were unprotected. From these figures it is clear that, contrary to the statement of former years, a large proportion of the Suburban population remains unprotected. But, according to Dr. Ghose, it is difficult to bring the infant population under control, for young children, specially in Mahomedan zenanas, are never brought out of them before they are two or three years old, and even then the female children are still kept in seclusion. If the birth registers disclose their existence anywhere, the reply to the enquiry about them is that they have been sent into the mofussil to their paternal and maternal homes. Again, it has been found that a fictitious address is given at the time the birth is registered, and that it is therefore impossible to trace the whereabouts of the child. It is hoped, however, that another two or three years of steady working of the Compulsory Vaccination Act may smooth down these difficulties, and render vaccination complete in the Suburbs. The deaths from small-pox in the Suburban Municipality amounted to 169 during 1884-85 against 158 in the preceding year, and 144 during the preceding lustrum, affording proof that much protection is yet required.

Degree of Protection in the *Suburbs of Calcutta.*

196. The information furnished by Dr. Wood under this head is very meagre and rather vague. He says, with regard to the places taken up for vaccination by the Licensed agency, that "all parts of the circle have been gone over by the Government agency in past years," and with regard to those taken up by the Government agency, that they "are protected every year—many almost perfectly," and that "immigration prevents this [thorough protection] phenomenon." Considering the circle as well advanced in protection, we find that the mortality from small-pox in the districts which comprise it stands as exhibited in the margin, indicating that Dinajpur, Rajshahye and Purneah demand much further attention.

Degree of Protection in the *Darjiling* Circle.

Rajshahye	65	12	Julpaiguri		10
Rungpore	5	6	Purneah	48	13

197. The report from the *Ranchi* Circle shows that no part of it has been thoroughly protected, excepting thanah Para in Manbhum; and that partial protection has been afforded to the whole circle, excepting two or three villages, and part of the Kolhan in Singbhum, and some villages in Hazaribagh and Lohardugga, which have not yet been touched. The work in the areas taken up for this year's operations is said to have been "well done, all villages in all thanahs

Degree of Protection in the *Ranchi* Circle.

being worked with few exceptions." In Lohardugga difficulties were experienced in vaccinating children. The people, particularly the higher castes, deny having any children, or hide them in their houses, or send them to other places on the approach of the vaccinators, and no assistance can be had from the chowkidars in the matter. In a large portion of Hazaribagh, however, the proportion of unprotected adults, who strongly object to receive vaccination, is greater. The mortality from small-pox in this circle stands as marginally given.

	Number of deaths. 1884-85.	1883-84.
Thoroughly protected—

Singbhum, excluding Kolhan	17	42
Very partially protected—		
Hazaribagh	750	405
Kolhan in Singbhum	...	24

Lohardugga and Hazaribagh appear to require considerably more protection.

198. In the *Sonthal Pergunnahs* Circle the areas said to have been almost thoroughly protected are thanahs Colgong, Banka, Bhagulpore, Sultangunge, Bihipore, Umurpore, and Katoreah in the *Bhagulpore* district; and thanahs Dumka, Rajmehal, Pakour and Deoghur (excluding Jamtara) in the *Sonthal Pergunnahs* district; the partially protected areas are thanahs Surajgurrah, Monghyr, Gogri, Khargpur, Beguserai, Sekundra, Jamalpur, Jamui, and Chakye in the Monghyr district; thanahs Muhdehpura, Kissengunge, Soopol, Pertabgunge and Bungaon in the *Bhagulpore* district, and Jamtara and Godda thanahs in the *Sonthal Pergunnahs* district; and the untouched areas are the Shaikpura and Tegra thanahs in the *Monghyr* district. The above is a more qualified statement than that submitted in the reports of former years, and the persistency with which small-pox has prevailed in these districts during the past three years indicates that the want of protection is very great, as the small-pox statistics exhibited in the margin abundantly prove. The thanahs in Bhagulpore and Monghyr, stated by the Superintendent to have well advanced in protection, do not appear, by the light of the marginal figures, to have done so; and the thanahs in Monghyr said to have been partially protected require considerably more protection. The Superintendent reports that the Rajpoots and Mughia Brahmins in some thanahs in Bhagulpore obstinately refuse, notwithstanding much persuasion, to receive vaccination, and that great resistance is also offered in every place in the Monghyr district, especially in Begooserai, where the law prohibiting inoculation is not in force, the opposition having been so great that the staff employed during the recess of this year to suppress outbreaks of small-pox in that district had to remain inactive for a considerable while.

199. In this Circle the districts of Dacca, Faridpore, Mymensing, Pubna and Tipperah are said to be protected, the last-named district having been completed during the year under notice, the others during the preceding year; thanahs Sudharam, Bamni, Begumganj and Ramganj in Noakhalli have been partially protected; and to thanahs Chagulnai, Fenny, Hatia, Sundip, and Lakhipore in the same district, and to the districts of Chittagong and Backergunge vaccination has not yet been extended. The mortality from small-pox in this circle, distributed over it according to the protection afforded to them, stands as shown in the margin. From the very severe prevalence of small-pox in Dacca and Tipperah, they cannot, as affirmed by the

Superintendent, have been thoroughly protected, and it is singular that Chittagong, where one or two vaccinators, appointed by Government (during previous years, but not during this year) have worked spasmodically, should exhibit so low a mortality as that indicated above. Imperfect registration has no doubt much to do in the matter.

Degree of Protection in the Orissa Circle.

200. In the *Orissa* Circle, thanahs Jajipore and Dharmsala in the *Cuttack* district are reported to have been now thoroughly protected, excepting some new-born children and adult females of high caste. To reach these it is proposed to extend the law prohibiting inoculation and the Licensed System of vaccination to these thanahs, and this question is about to be submitted to Government for orders. Thanahs Cuttack,* Kendrapara,* Salipore,* Patamudi,* Aul,* Juggutsingpore,* and Tirtolla* in the *Cuttack* district; thanahs Chandballi,* Balasore, Basta, Jellasore, Bhadrak and Dhamnagur in the *Balasore* district, and thanahs Gope, Puri,* Khurda, excluding its Bhoboneswar outpost, and Banpur,* excepting its Chumpagarh outpost, in the *Poori* district, have been partially protected. The thanahs marked with asterisks are more advanced in protection than the others, but still a great deal has to be done in them to induce people of high caste to accept vaccination. The Bhoboneswar outpost of Khurda and the Champagarh outpost of Banpur in the Puri district, and thanahs Soro, Baliapal, and Basudebpore in the Balasore district have not yet received any protection. The death-rates from small-pox in the abovementioned areas are indicated in the margin. Thanahs Jajpur and Dharmsala in Cuttack, said to have been thoroughly protected during the year under review, appear to have suffered much more severely from small-pox than during the preceding year, when they were partially protected. On the whole there is much vaccination to be done in Orissa.

Degree of Protection in the Behar Circle.

201. In the report of this Circle for the preceding year, it was said that the whole of the Patna district (with the exception of a few villages in each thanah and the Geriak outpost in thanah Behar), thanahs Motihari and Dhaka in Chumparun, excepting a few villages, and about three-fourths of the Arrah thanah in Shahabad had been thoroughly protected. The following statement made by the Superintendent this year is quite at variance with the above. He says that the *only fairly well protected* areas (not *thoroughly* protected) in Patna are thanahs Barh, Mokamah, Futuha, and Behar; that the partially protected areas are the rest of the thanahs in the Patna district (Dinapore, Maner, Ataserai, Silao, Patna, Bankipore, Masourhi, Bikram and Hilsa), thanahs Motihari and Dhaka in the Chumparun district, and thanahs Buxar, Dumraon, Dhungain, Pero, Arrah, and Belouti in the Shahabad district; and that the altogether unprotected areas are the remaining thanahs in the Chumparun and Shahabad districts, viz., Bettiah, Gobindgunge, Baguha, Mudhubun, Kesuriah, Adapore, and Lourya in the former district, and Sasseram, Nokha or Kharger, Bhabuah, Dehri and Mohania in the latter, and the entire districts of Mozufferpore, Durbhunga, Sarun and Gya. The effect which vaccination has had on small-pox prevalence in this Circle will be seen from the statistics furnished in the margin. These figures indicate that a great deal of attention is yet needed, not only in the Patna district, which was placed last year under the Licensed System of vaccination, but also in the thanahs in Chumparun and Shahabad, which are being worked by Government vaccinators. It appears to me that the Superintendent of this Circle cannot efficiently protect any district.

Ratio per 1,000 of population (Population 219,646).	·07	·02	Ratio per 1,000 of population (Population 199,430).	·19	·24	Ratio per 1,000 of population (Population 196,149).	·13	·07

The above figures indicate that the influence of vaccination has had a decided effect in reducing the mortality from small-pox in the Municipalities said to be thoroughly protected, but that the mortuary records do not support the statement that protection has well advanced in Durbhunga and Howrah, or that Kushtea is fairly well protected. Of the remaining 108 Municipalities, 42 are said to have been partially protected. In these (excluding Khulna, of which no separate death record exists) 1,469 casualties from small-pox occurred among their population, numbering 1,024,042, yielding a death-rate of 1·43 per 1,000 against 910 deaths, or at ·88 per 1,000 in 1883-84. The remaining 66 Municipalities are reported to be very partially protected. In these (excluding 16, of which no data are available) there were recorded 251 deaths among their population of 632,913, the proportionate death-rate being ·39 per 1,000 against 116 deaths, or at ·18 per 1,000 in the preceding year.

203. The following observations made by the Medical Officers in charge in connection with the degree of protection in their towns may be found interesting. In *Burdwan* small-pox never gets any firm hold in spite of the periodical introduction of the disease from other places. This is advanced as a ground for believing that the town is well protected. The Kalna town requires a great deal more protection. The Civil Surgeon of *Midnapore*, Dr. Tomes, observes:—"Owing to the extinction of unprotected material by the vaccination of the youth, adolescent and adult population, the number attending the stations now grows smaller and smaller. This is what must be expected. The work of the future will be confined more and more to infant vaccination. The next step in bringing the system into complete working will be the seeking out of infants by the municipal birth register and the carrying out of the rules under sections 18 to 23 concerning vaccination in connection with registration. It has been necessary to introduce the different parts of the scheme by degrees to avoid confusion and failure. Arrears having now been largely cleared off, the outturn of work in future years will be smaller, but will be attended with more trouble, and perhaps more expense. There will be a scarcity of vaccinifers, and the unprotected children will require seeking out at their homes. As the Municipality now entertains a Sanitary Inspector, this looking up the children by the (birth) register should be made a most important part of his duty." The *Baranagore* Municipality has been fairly protected so far as the fixed population is concerned, but there is always a large floating population of up-country people attached to the many factories in this place, to vaccinate whom it is necessary that work be carried on all round the year, instead of during only the working season. The *Baraset* Municipality was fairly vaccinated in previous years, and the work of this year gave it complete

Observations of the Medical Officers on Protection in Towns.

protection. There was only one case of small-pox; the people are too well-protected for the disease to spread. The *Nyehatti* town requires more protection, as there are mills there. The one vaccinator allowed by the Municipality is inadequate for a population of 21,533. Vaccination also requires to be kept up throughout the year. In *Dinajpur* it was observed that unprotected children still exist who could not be operated on owing to ill-health or unwillingness on the part of parents to have them vaccinated on account of commencement of an unusually hot season. *Beauleah.*—The unprotected have been reduced to a low figure, but the Civil Surgeon is fully convinced that there are still a good many remaining to be protected The death-rate from small-pox in this town during the year under review amounted to 2·32 per 1,000 against no mortality in the preceding, year, and ·04 per 1,000 during the lustrum 1879-80 to 1883-84, indicating that the town has been kept in a very unprotected state. The reason for considering the *Sudharam* town to be well protected is that not a single case of small-pox was reported to have occurred in it during the year. It is stated that in the *Comillah* town the vaccinator could not find sufficient work owing to the greater part of the young portion of the population being already protected. The drawback against the thorough protection of the *Durbhunga* Municipality is that it is very large and densely populated. A singular step was taken this year in the *Purneah* Municipality, with the view of promoting vaccination, viz., warning was given to the people that if they did not get themselves vaccinated they would, if small-pox broke out among them, be isolated or required to go out of the municipal boundary. In old *Maldah* town most of the children under one year are unprotected, as the people will not have them vaccinated before they attain that age; but the chief reason is the retention by the Municipality of an incompetent vaccinator. It appears to the Civil Surgeon that the *Nya Dumka* town has been pretty fairly vaccinated—almost wholly—though not completely protected. The exceptions are a few well to-do people, who are not willing to send their children to the dispensary, but are willing to have them vaccinated at their houses. As the Municipality had engaged no vaccinator this could not be done. The Deputy Commissioner, however, observes that "under present circumstances I think it is a mistake to treat Dumka as a town. It is not a town, though it might be called a fairly large village in respect to the number of its inhabitants; but as there is a large and continuously changing temporary population, it should, I think, get more protection than is at present accorded to it. All the villages surrounding it require to be thoroughly protected by the Government vaccination establishment. It would be better if the vaccination department included Dumka in its operations, as with a special department at work the town would stand a chance of being better protected than it does at present when the work is left to an over-worked Hospital Assistant, who deals only with those persons actually brought to him." Except for the coolies and other unprotected persons coming into *Sahibgunge* town, which is a commercial centre, it may be considered completely vaccinated. The town of *Ranchi* is considered to be fairly well protected owing to the entire absence of small-pox, though it was prevalent in the surrounding villages.

Summary.

204. In summing up the work of the year, so far as it is connected with the areas vaccinated and the protection afforded, it is found—

(1) That *protection was afforded for the first time* by Government vaccinators to the following areas:—In the *Eastern Bengal* circle to thannas Daukandi, Juggunathdighi, Chandpur and Laksham in the Tipperah district; and to thanah Chagulniah and Fenny in Noakhalli; in the *Orissa* circle to thannas Patamundi, Aul, Dharmsala, Banki, Juggutsingpur and Tirtol in the Cuttack district; and in the *Behar* circle to thannas Buxar, Dumraon, Dhangain and Belouti in Shahabad.

(2) That the following areas were *for the first time placed under the Licensed System of vaccination* after they had been traversed by the Government vaccinators. In the Eastern Bengal circle thannas Nussirabad, Sherpur, Agarsindhoo or Nickley, Kishoreganj, Netrokona, Kendu or Bazitpur, Iswarganj, Durgapur and Fulpur in the Mymensing district; and in the *Behar* circle to the whole of the Patna district.

(3) That the areas, in addition to those of former years, which had been *thoroughly protected* at the close of the season 1884-85 were—In the *Ranchi* circle, thanna Para in the Manbhum district and parts of the Palamow Sub-division in Lohardugga; in the *Eastern Bengal* circle, the districts of Tipperah and Pubna; and in the *Orissa* circle, thannas Jajipur and Dharmsala in the Cuttack district.

Source and character of Humanized Lymph.

205. This lymph, which was received from all the vaccination circles, and from England, was distributed by this office to the Municipalities, Dispensaries, &c., but not to a very large extent. Generally it was subordinated to bovine lymph, and supplied when special requisitions were made for it, or when bovine lymph repeatedly failed. In this way 1,543 tubes of it were distributed, against 2,743 tubes of bovine lymph. In *Calcutta* it was used to a limited extent, the majority of the operations being carried out with animal virus. The lymph used in the whole of the *Metropolitan* circles was that which had been established in the beginning of the season from calf lymph. The *Orissa* circle appears to have commenced operations with English lymph, and to have continued to use it whenever required, as it is said to have kept in good condition throughout the working season, but calf lymph was also used at Cuttack at the beginning of the season. In all the rest of the Circles humanized lymph was employed as usual. The character of the virus was, on the whole, good throughout and the vesicles typical. Crusts were used in some places in the *Eastern Bengal* circle and in the Chatra and Kandi towns, for no assigned reason, and in the *Balasore* town, because the people have a strong prejudice against arm-to-arm vaccination. In the *Behar* circle in most of the operations carried on by the Licensed vaccinators, lymph in glasses was used, indicating that the Superintendent cannot carry on arm-to-arm vaccination in his Circle. Lymph is now stored and supplied in capillary tubes of Husband's pattern manufactured in the Government Medical Store Department.

Bovine Lymph—number of Operations performed, with results.

206. The subjoined statement shows the number of vaccinations which were performed with bovine lymph during the year under review in the several Vaccination Circles and in 26 of the Municipalities, and the results which were realized. From it are eliminated those areas in which the first attempts to vaccinate with the virus having failed, further trials were abandoned, and those in which the operations were conducted on a scale so small that non success was more than a probable contingency:—

Virus.	Circles.	Total number vaccinated.	Primary.		Re-vaccination.		Percentage of successful cases to total vaccinated.	
			Number vaccinated	Number successfully vaccinated.	Number re-vaccinated.	Number successfully re-vaccinated.	Primary.	Re-vaccination.

	Sonthal Pergunnahs Circle	23,165	23,165	20,135	......	......	99·87	......
	Total ...	4,20,520	4,14,461	4,12,348	6,059	1,924	99·49	31·75
	Total of Vaccination Circles	4,29,306	4,19,024	4,16,322	10,282	3,911	99·35	38·32
	In 26 Municipalities	7,803	7,654	7,161	149	73	93·55	48·99
	Grand Total .	4,37,109	4,26,678	4,23,483	10,431	4,014	99·25	38·48

These figures indicate—

(1) That of 3,380 primary operations with lymph taken *direct from the Calf*, 3,084 or 91·16 per cent. of the total primary vaccinations proved successful, against 91·61 per cent. in the preceding year; the work (depôt and house vaccinations combined) in the Calcutta Central Depôt exhibiting a percentage

of 80·72 against 89·76; and the Calcutta vaccinations, conducted by the Health Officer, yielding a percentage of 96 against 96·04 in the preceding year.

(2) That with lymph *stored in Tubes* 1,183 primary operations were performed in the Orissa and Ranchi circles, which yielded a percentage of 75·23 successes.

(3) That with lymph supply established from the calf and afterwards transmitted from arm-to-arm, 414,461 persons were vaccinated primarily in five Vaccination Circles, of whom 412,348, or at 99·49 per cent. were successfully operated on, the variations in percentages lying between 93·83 in the Suburbs of Calcutta and 99·87 in the Sonthal Pergunnahs.

(4) That in the 26 Municipalities 7,654 operations were conducted, which resulted in 7,161 successes, or at the rate of 93·55 per cent. of the number vaccinated. Examining the detailed statement (*vide* Appendix V to this Report), of which the above table is an abstract, it is seen that the maximum percentage is 99·90 in Serampore, with 1,056 successes in 1,057 operations, and the minimum 6·81 in Tumlook, with three successes in 44 operations.

(5) That the percentages of re-vaccinations varied, ranging from 61·24 in the Calcutta Central Depôt with lymph direct from the calf to 12·33 with arm-to-arm transmission of bovine lymph, excluding Calcutta where the proportion stood at only 6·58 per cent.

(6) That on the whole an aggregate of 437,109 persons were vaccinated, 426,678 primarily and 10,431 secondarily, the former operations terminating in 423,483 successes, or at the rate of 99·25 per cent., and the latter in 4,014 successes, or at 38·48 per cent.

The results obtained by employing bovine lymph in tubes, in comparison with that achieved by transmitting the same virus by the arm-to-arm process and that realized by operating with bovine lymph in the latter manner in comparison with that attained with humanized lymph used in the same way, are presented in the following abstract:—

	Percentage of Successful Cases to Total Vaccinated.							
	With Lymph in Tubes.				By the Arm-to-arm Process.			
	Primary.		Re-vaccination.		Primary.		Re-vaccination.	
	Bovine.	Humanized.	Bovine.	Humanized.	Bovine.	Humanized.	Bovine.	Humanized.
In the Vaccination Circles ..	75·23	... .	... .	.....	99·49	99·10	31·75	73·30
In the 26 Municipalities	81·16	... ..	48·95	.....	96·16	92·79	49·05	70·93

207. I submit that these Statistics indicate that, on the whole, the results realized, as shown by the percentages of success, are very satisfactory, excepting those obtained by the employment of bovine lymph stored in tubes. The chief difficulty connected with this class of virus is that in passing into the tube a little serum of blood goes with it, squeezed from the vesicle on the calf by the forceps which it is necessary to use, and this is apt to bring about speedy deterioration during transit. The observations of Dr. Ghose, who officiated as Superintendent of Vaccination, Metropolitan Circles, during the year, which will be submitted presently, contain valuable suggestions on this subject. The remarks of the Medical Officers who undertook operations with stored bovine lymph during the year, a *resumé* of which is subjoined, contain both favourable and adverse opinions on the subject; but it will be noticed that the balance of the evidence indicates that if tube lymph is not superior, it is at all events equal in operative power to humanized lymph, apart from the important fact that the former can be made available at all times. I will only add to these observations that the reports show that even in operations conducted during the year with humanized lymph, the number of non-successes was more than usually large.

Results, on the whole, satisfactory.

Dr. Ghose's observation on the employment of Stored Lymph.

208. "It has been frequently complained by people who had bovine lymph sent out to them, that operations done with them did not succeed. Monsieur Despeissis, who took a vaccinated calf from this depôt to the Mauritius, propagating the lymph from calf to calf on the voyage, and who has established an institution there similar to our Calcutta depôt, also writes to say that when he vaccinates direct from the calf it invariably succeeds; but when he sends the lymph in tubes to any out-station, success is rarely obtained. This is due, I believe, to the fact that however carefully lymph may be collected and stored, the act of squeezing the skin of the calf with a pair of forceps sends a little serum of blood into the tube. When this is the case, the serum decomposes and the virus dies. It is therefore necessary to select the tube before operating with it. Any tube that is thus spoilt becomes whitish instead of being transparent, and when opened the contents will come out like a thread. If such tubes are rejected success can be ensured. During the year I made careful observations on this subject to see if the forceps could be dispensed with, or if by superficial insertion of the lymph the vesicles could be made superficial enough to draw out the virus by a mere puncture into a pearly drop, as is done in the human arm, and I regret to say that in the process of collecting lymph the forceps cannot be dispensed with and serum must therefore come out and get mixed with it. It is therefore a necessary evil. I tried glass slides in storing lymph with no better result. It is only a familiarity with the appearance of good lymph that will ensure success. I have noticed that the vaccinators attached to the Calf Depôt never failed with their operations; whereas the men in the Suburban vaccine stations failed in many cases, until I made them practise with the calf lymph for some time. It has been found by experience that during the last two months of the rains, from the middle of September to the middle of October, it is extremely difficult to keep up lymph in the calf. Several points fail and in many instances the whole case becomes unsuccessful. This also I believe is due to the rediness with which decomposition goes on at this season; and before the virus can be absorbed into the body, it succumbs to the decomposing influence of the weather."

Local Opinions on the Subject.

209. The following is a resumé of the opinions on the subject submitted by the local officers who employed bovine lymph during the year in conducting vaccinations.

Observations and opinions of the Superintendents of the Vaccination Circles.

210. In *Calcutta* work with bovine lymph was started from the 1st of December, and the primary operations conducted amounted to 2,327 with lymph taken direct from the calf, and 11,093 with humanized bovine virus by the arm-to-arm process. Ninety-six per cent. of the former and 95·88 per cent. of the latter proved successful. There were besides 2,535 re-vaccinations attended with 13·20 per cent. of successes. A vaccinated calf is supplied to the Corporation every day from the Central Depôt, so that vaccination is available to the whole of Calcutta all the year round Referring to the value of bovine lymph as an operating agent, Dr. O'Brien, the Superintendent, says: "As stated in last year's report the results of vaccination with the calf lymph have not been uniformly successful. At times the vesicles were very typical and almost identical with those obtained with the humanized lymph; frequently, however, they were found weak and small and ran an irregular course, and there were complete failures occasionally. The Deputy Superintendent ascribes this unfavourable result to the extreme pressure used in taking out the lymph, by which it becomes diluted with blood and serum, and it is this diluted lymph which gives rise to weak vesicles. He vaccinated some cases himself with lymph taken with very moderate pressure with better results. I myself vaccinated a few cases with lymph taken without the application of the forceps, and the result was excellent. This was, of course, a slow process and took much time, which is not suitable for vaccinating a large number of people in a station. Still I think better results would be, as a rule, obtained in vaccination from the calf, if the lymph were taken from the vesicles with the least possible pressure, instead of with the considerable pressure which is exercised when the forceps, ordinarily used, is employed. In this way the admixture of a large amount of serum would be avoided. It is difficult to

predict the protective power of each variety of lymph. As great care has been taken to make the points of insertion of the calf lymph different from those of the humanized lymph, future epidemics will enable us to decide this point more accurately than can be done at present."

Metropolitan Circles.—The work throughout the 11 districts comprising this circle was started with bovine lymph sent out in tubes in the beginning of the season, and the result was that a daily supply of humanized bovine lymph was available in every thanna before the close of September, and thus a longer vaccination season was secured. With this lymph the whole work of the year of the entire circle, amounting to 366,139 operations, were conducted. Of this number 365,781 were primary operations and 358 secondary, and 99·79 per cent. of the former and 58 75 per cent. of the latter proved successful. The observations of the Superintendent of this circle on the merits of bovine virus have been submitted above.

Suburbs of Calcutta.—Calves were sent to the Suburbs four times a week, and thereby the work was not only facilitated, but also ensured good results. It is to be regretted that a separate record of vaccinations with lymph direct from the calf was not kept here. This omission will be supplied next year. Fifteen thousand and twenty-one vaccinations with humanized bovine lymph by the arm-to-arm process were carried on, of which 11,339 were primary operations and 3,682 (mostly in the Cooly Depôts) were re-vaccinations. The former was attended with 98·35 per cent., and the latter with 46·92 per cent. of successes.

In the *Darjiling* Circle all attempts to establish vaccination with bovine lymph failed. Dr. Wood, the Superintendent. who did not conduct the operations himself, says that the virus when received by him was very dark (yellow). He is, however, not aware of the causes of want of success; but he has "no reason to suppose that four competent hands (who carried out the experiment) would not have made the virus '*take*' had it been viable. Perhaps the supplies were kept too long before being forwarded to *me*" This was, however, not the case, for as soon as the lymph is received in this office, it is distributed to those who require it. Dr. Wood adds :—"I am not myself in a position to form a favourable opinion of bovine lymph as compared with humanized lymph."

In the *Ranchi* Circle 244 vaccinations, attended with 106 successes, or at 43·44 per cent., were carried on with lymph in tubes. The Superintendent, Dr. Owen, says that in a few cases the vesicles were small and weak, but in the majority of them they were large and differed not at all, or very slightly from those obtained from humanized lymph; that great heat and local irritation were common; that higher fever than that which follows vaccination with humanized lymph was not noticed; and that the lymph rapidly deteriorates when stored in tubes, but that if used immediately after it is put in the tubes, much success is attained, as was the case in Ranchi. He believes that, whatever the merits of this lymph, it is not suited for his Circle, as the people in Chota Nagpore are not sufficiently advanced to accept vaccination with it, and its adoption would be simply adding another to the many excuses already made for refusing vaccination

In the *Sonthal Pergunnahs* Circle bovine lymph in tubes was, after having been established, transmitted by the arm-to-arm process to 23,165 cases, representing over 18 per cent. of the total work of the year, and of these cases 99·87 per cent. proved successful. The Superintendent, Assistant Surgeon Kally Prosonno Ghosal, reports that "the operations performed with bovine lymph gave highly satisfactory results. The areola produced had wider bases and distinct and deeper marks were produced "

In the *Eastern Bengal* Circle 56 persons were vaccinated with bovine lymph in tubes with seven successes and 49 failures. Nevertheless, after virus was thus established, of 3,083 operations, by the arm-to-arm process, which were conducted, 3,039 or 98·57 per cent. proved successful. Mr. Lyons, the Superintendent, says that every precaution against failure in operations with tube lymph was adopted, "but to no effect ;" that the lymph in the majority of the tubes came out stringy ; and that he has no doubt in his mind that "humanized lymph in tubes is superior to bovine lymph in tubes"

In the *Orissa* Circle five calves and 33 persons were vaccinated by the Superintendent, Mr. P. Veeriah Naidu, with bovine lymph in tubes sent from this office, and the operations on four of the calves and on 29 persons proved

successful. After this, the lymph obtained from the calves and stored in tubes, was distributed to the vaccinators, who performed 939 operations with it, of which 784 or 83·49 per cent. proved successful. Evidently the lymph was allowed to die out, and no use was made of the virus from the 33 persons who were vaccinated with lymph direct from the calf. Had this been done, a much larger number of persons would have been protected with this virus, as was the case in the other Circles. The Superintendent reports that in every case the vesicles raised from this lymph were "more characteristic and typical than those obtained from humanized lymph;" but that the cause of failure was that the stored lymph was kept for a much longer period than usual, when it became coagulated, and when wanted for use it came out thready. As, however, he had established lymph locally, he had the opportunity of providing himself with fresh supplies by propagating it.

In the *Behar* Circle 14 persons were vaccinated with lymph in tubes, of which only three proved successful, and from these cases six other persons were operated on successfully; but the latter class of operations could have been easily extended if the Superintendent had taken any trouble in the matter. His report shows that in the successful cases with tube lymph the course and development of the vesicles were rather retarded, the areola forming on the ninth day, and that the fever was high in all the cases; but that after transmission the vesicles took the regular course and appeared good and typical, and better than those obtained from humanized lymph.

211. *Burdwan.*—The results in the *Burdwan* Town were not satisfactory. The Civil Surgeon, Dr. Purves, says that the virus had not been properly preserved, and in some instances it was quite dry. In the *Raniqunge* Town all the cases (number not stated) failed. The cause of failure is believed to be decomposition of the lymph during transit, and in this respect humanized lymph is said to be better than bovine when brought from a distance. In the *Chakdighee* Dispensary only one person was successfully vaccinated, and from this case others were operated on. Assistant Surgeon, Onocool Chunder Chatterjee, reports that this lymph acts in a very similar manner to humanized lymph, and that if there is any difference, the former produces more constitutional irritation than the latter, but that this may be due to the heat of the weather.

Observations and Opinions of the Medical Officers in Municipalities.

Hughli.—In the Hughli Municipality 22 persons were vaccinated, 18 successfully. Dr. Gregg, the Civil Surgeon, says that if a fresh supply of tube lymph could be easily kept up, there would be no objection to its use. From the *Serampore* Municipality a child was taken to Calcutta and vaccinated direct from the calf, after which operations were performed by the arm-to-arm process satisfactorily.

Nuddea.—In this Municipality 14 trials were made, and all proved unsuccessful. The Civil Surgeon, Dr. Russell, reports:—"It would seem that this lymph had lost its efficacy in transit. I do not think any opinion unfavourable to the employment of bovine lymph in a perfectly fresh state can be deduced from this failure It has been definitely ascertained from experiments made with bovine lymph under the auspices of the Local Government Board in England that this lymph, though very efficacious when transferred immediately from the calf to the human subject, yet must be used absolutely fresh to produce favourable (or indeed any) results, as it loses its efficacy, if kept, much more rapidly than humanized lymph does. The Committee recommend that, whenever possible, bovine lymph should be used direct from calf vesicle without delay." In connection with these observations Dr. Russell submits the following extract from the Report* on the Working of the new Animal Vaccination Establishment of the Local Government Board: "A caution is required with regard to the use of stored animal lymph. Experience seems to show that lymph from the calf is less capable of preservation than that which has passed through the human subject. * * * If stored animal lymph should come to be sought after by the general public to the exclusion of arm-to-arm vaccination, far more harm than good is likely to result from the introduction of animal lymph into this country * * * If the vaccination of human beings is to depend upon the use of animal lymph, it is necessary that this should be done direct from the calf."

---

* See British Medical Journal, November 18th, 1882, pages 1015 and 1016.

In the *South Barrackpore* Municipalty 698 vaccinations with tube lymph were performed, of which 693 or 99·28 per cent. proved successful. No opinion on the value of the virus has been submitted.

Khulna.—In the *Debhatta* Town work was commenced with bovine lymph, and continued by the arm-to-arm process, resulting in 303 operations with 97·68 per cent. of successes. The same was done in the Satkhira town, but the results have not been furnished.

Of 664 vaccinations in the *Berhampore* Town, 538 (535 primary and 3 secondary) were conducted with bovine lymph, and of this number 530 were successful, the percentage being 99·07. The Assistant Surgeon Bany Madhub Bose says:—" The vesicles from the humanized lymph when genuine resembled those of the bovine, but it changed its character and type when operations were performed from too mature a vesicle. There was no such disadvantage with the bovine lymph."

Dinajpur.—Here bovine lymph was largely used, but owing to the carelessness of one of the vaccinators a separate record of results was not kept. The Civil Medical Officer, however, says that there was little difference between this and humanized lymph, both were successful and unsuccessful, but in arm-to-arm vaccination both were invariably successful.

In the charitable dispensary in *Bogra* Town two children were vaccinated with bovine lymph successfully, and the Civil Surgeon, Dr. Wilson, makes the following remarks on these cases:—(1) " That the vesicles raised by the bovine lymph were characteristic and identical with those produced by the humanized lymph. (2) That the areola was well developed on the 8th day after the operation. The irritation and inflammation was less than in humanized lymph. (3) The operation was followed by less than ordinary fever, which commenced on the 6th day." In the *Nowkilla* Dispensary in Bogra 35 operations were performed with bovine lymph, and all of them proved successful. After this, vaccination was maintained by the arm-to-arm process. The vesicles raised by the lymph are said to have been "small and weak, and consequently the crusts were out within the 14th day; but the operations performed by arm-to arm were better, as their crusts were on the points till the 18th or 19th day." The Civil Hospital Assistant, Brojo Nath Sanyal, of the *Sherpur* Dispensary in Bogra, observes:—"That the vesicles raised by bovine lymph were characteristic and identical with those produced by humanized lymph; that the areola was well developed in three out of the six operations which were performed; that the irritation and inflammation were less in two cases; and that all the cases had the ordinary fever."

In the *Pubna* Municipality the first trial in September failed. In this month the weather was too hot for either the lymph to keep well, or the vaccination to succeed. On two more attempts being made in October and November, partial success was attained, and the work of the season was commenced. Altogether 745 vaccinations were performed by the arm-to-arm process, of which 722 were primary operations, which were attended with success in 700 instances, or at the rate of 96·95 per cent. The Civil Surgeon, Dr. Dutt, says that the quality of the subsequent supplies was bad in several instances, having a " beaded appearance, reddish tinge from admixture of blood, or a dull appearance of the lymph." He is of opinion that " vaccination by tube lymph is an uncertain method, suitable only for the establishment of virus in the stations adjacent to Calcutta. Once the virus is established it has to be kept up by arm-to-arm process. This process, I believe, ultimately deteriorates the virus, and the necessity hence arises of re-establishing the virus by frequent trials. Calf lymph produces in most instances strong fever, and the vesicles make their early appearance."

Dacca.—The account from the Dacca Town is to the following effect. Of 25 primary operations performed with one small supply of bovine lymph, 21 proved successful. The vesicles rose at most of the points where it was inserted, but were smaller in size, and less inflamed than is usual with humanized lymph. Of six re-vaccinations all proved unsuccessful. Four of these were afterwards successfully operated on with lymph from human vaccinifers. In one case the man was operated on, on one arm with bovine, and on the other with humanized lymph; the former failed, while the latter succeeded. This want of uniform success was ascribed to delay in transit which caused deterioration of the lymph. With another small supply 15 primary vaccina-

tions were performed, and all were successful. Thus in all 40 operations were performed which were attended with 36 successes, or at the rate of 90 per cent.

In the *Furidpore* Town 30 operations were performed with three successes. The Civil Surgeon, Dr. Basu, says that the amount of work done with this virus was too little to enable him to form an opinion of its value; but that if any opinion was proper he should consider stored bovine lymph to be inferior to stored humanized lymph, either owing to its greater plastic properties, or greater liability to become altered by heat. In some of the tubes received by him the lymph looked clear and fluid, in others inspissated and yellowish, and in one or two there were some minute clots of blood.

Dr. Richards of *Goalundo* makes the remarkable statement that he tried bovine lymph in 10 or 12 occasions in Calcutta, but never had a successful case, though every care was taken to conduct the operation properly.

In the *Mymensing* Town no record of the operations performed was kept; but it was noticed that the success attained was not so great as with humanized lymph; that the vesicles produced by bovine lymph were small and weak and later in developing; and that persons vaccinated from these vesicles had thorough good strong ones, the secondary fever being less marked. The lymph was often found coagulated in the tubes, which had to be warmed, or a horse hair passed into them to get it out.

In the *Sudharam* (Noakhali) Town, of 13 operations only one proved successful, and on this case only one vesicle appeared and developed to completion, and corresponded with vesicles produced by humanized lymph. The failure was attributed to the lymph having deteriorated.

In the *Commillah* Town two supplies failed, but the third one received in October proved successful, and since then vaccination was freely carried on from arm-to-arm till the close of the season. Altogether 617 primary operations were performed, of which 549 or 84·85 per cent. proved successful. The Civil Surgeon, Dr. ffrench-Mullen, believes that the results obtained by using bovine lymph are better than when humanized lymph is employed, the vesicles being larger and clearer, and the subsequent marks more characteristic.

In *Darjiling* Town after several failures of operations on adults, a child was successfully vaccinated From this case arm-to-arm vaccination was carried on. Dr. Nicholson, the Civil Surgeon, reports that the vesicle in this case did not appear to differ materially from that obtained from humanized lymph, and the vaccination ran the ordinary course.

Shahabad.—Here of 78 operations which were performed in the *Arrah*, *Buxar*, *Dumraon*, *Bhabuah*,* *Dehree*, *Jugdispore* and *Sasseram* Towns (seven by Dr. Price, the Civil Surgeon at Arrah,) only 10 proved successful. Dr. Price observes:—"This want of success with bovine lymph strikes me all the more, because last year I was very favourably impressed by it, the lymph as a rule being successful, though the vesicles at first were small and the areola not marked, the vaccination from these vesicles produced excellent results." The report from Jugdispore is to the effect that there was more inflammatory action and more fever than with humanized lymph. The Assistant Surgeon of Sasseram writes:—"It was after the use of crusts [whence obtained is not stated, certainly not from this office,] that satisfactory results were obtained, so I do not think that bovine lymph was superior in value." On this statement the Civil Surgeon observes:—"My own opinion is that if the bovine lymph was originally good and could be well preserved, vaccination from it would be very much better than from humanized lymph, viz., to commence operations with; but evidently the lymph sent from Calcutta varies so much in quality that it cannot be depended on."

In the *Durbhanga* Town the first instalment of the lymph failed, but by perseverance success was attained, after which the arm-to-arm process was adopted. In all 82 operations were performed, of which 75 or 91·46 per cent. were successful. The Civil Surgeon, Dr. Shaw, states that the results in both kinds of lymph were the same. There was no difference in the size of the vesicles, nor in the appearance of the zone of inflammation. He has no facts to adduce with regard to the protective powers of bovine lymph. In the *Madhubani* Town, in the Durbhanga district, 173 persons were vaccinated,

of whom 134, or at 77·45 per cent., were successfully operated on. It is not stated how many of these had bovine lymph directly inserted, and how many received protection by the arm to-arm process. The Assistant Surgeon, Raj Coomar Coondo, says that the number operated on was too small to justify an opinion being offered as to the merits of the lymph; but that from what he had seen he found that it took with difficulty, and that it appeared to be superior to humanized lymph, the vesicles it produces being less irritable and ulcery, and there being hardly any constitutional disturbance, and no eruptions as was noticed in a few cases vaccinated with humanized lymph.

In the *Chupra*, *Sewan*, *Gopalgunge*, *Revilgunge*, *Bhori* and *Hutwa* Towns in the Sarun district 60 operations were performed, of which only seven proved successful. It was observed that at Gopalgunge the prophylactic could not be kept going by arm-to-arm vaccination with virus taken from the two successful operations with bovine lymph. The Civil Surgeon, Dr. Russell, says that in some instances the lymph received seemed clear and good in every respect, but that in others it had lost its clearness and transparency, and became thick and opaque, and sometimes it was quite dried up. He cannot account for the want of success in cases where the lymph used was clear and apparently of good quality, except on the supposition that bovine lymph does not prove as active in the Behar climate as humanized lymph In general he has observed that October is altogether unfavourable for vaccination. and that the prophylactic does not take until the close of November. On this point he writes:—"I believe that there is some peculiar condition of the atmosphere in the month of November, which militates against successful vaccination. One can understand how this should be the case from April till the middle of June, when great heat provails, and from the middle of June till the end of October, when heat and moisture are combined. It is difficult, however, to understand why really good, clear, and carefully preserved lymph should be so tardy in taking in the month of November, except on the hypothesis that there is some electric or chemical change in the atmosphere just before the setting in of the cold weather." Similar climatic effects are not, however, reported from the Behar Circle of vaccination."

In the *Monghyr* Town after the virus had been established, 40 operations were performed with only 16 successes. In the *Jamalpore* town, in the Monghyr district, the results are reported to have been unsatisfactory. Dr. Brooke notes that it was rare to get a good pustule, and that he considers the results to be obtained from humanized lymph much more satisfactory than those from bovine lymph.

In the *Bhagulpore* Town, after several failures, success was obtained, and arm-to-arm vaccination adopted. There were in all 597 operations, of which 504 were primary and 93 re-vaccinations. Of the primary operations 432 or 85·71 per cent. proved successful.

In the *Old Maldah* Town bovine lymph was tried in nine cases with five successes. Larger success could not be attained, as the quality of the lymph was not good. The Civil Hospital Assistant thinks that good bovine lymph would be more successful than humanized lymph.

In the *Dumka* Town the first supplies completely failed, the cause being according to Dr. Gupta, the Civil Surgeon, that the lymph had deteriorated before its use. In the month of February, however, with fresh supplies, 13 persons were vaccinated, all successfully. The vesicles in these cases, Dr. Gupta says, were perfectly healthy and passed through the ordinary stages of development, growth and decay, and that this clearly shows that if the bovine lymph be pure and used before it deteriorates from climatic and other causes, it succeeds just as humanized lymph in producing healthy vesicles. He continues:—"I am asked to express my opinion of the comparative value of bovine and humanized lymph. My personal experience of the value of bovine matter, as an agent of protection from small-pox, is limited. I do not, therefore, feel justified to express an opinion, so far as that opinion can be said to be based upon my personal experience; but from my own experience, taken in connection with that of others, as gathered by a careful study of the literature of the subject, I am inclined to believe as follows: (1)—That bovine lymph, if selected, and used with all the care and

precautions with which humanized lymph *is used*, offers as great a protection against small-pox as does humanized lymph. (2) That bovine lymph offers in *this country* an advantage over humanized lymph, inasmuch as it offers an unfailing source of virus for continuous and systematic operation, when humanized lymph cannot often be secured for arm-to-arm to vaccination, in consequence of great aversion on the part of parents to part with lymph from the arms of their children. This difficulty, I believe, has been felt by all medical men in this country, and this difficulty has invariably led to loss of time, interruption in the work, and incomplete protection of a selected area. The bovine lymph meets this local difficulty completely. (3) That bovine lymph offers greater protection than humanized lymph, is a proposition which does not appear to me to have been established upon sufficient grounds, and that this question must be left open for many years to come. (4) The advantage claimed in favour of bovine lymph is that it, at any rate, does not communicate human diseases. This appears to me falacious. The argument first supposes that humanized lymph does communicate human diseases, and then affirms that bovine lymph does not communicate those diseases. In the first place careful vaccination with humanized lymph does not necessarily communicate human diseases, and if it does, the chances are very small indeed, and the same can be said of bovine lymph. It may not communicate human diseases, but it has equal chance of communicating bovine diseases to men. The fact of the matter, as it appears to me, is this, that neither humanized lymph has any appreciable chance of communicating human diseases, nor bovine lymph bovine diseases; if we adopt all the necessary precautions in vaccination—(*a*) proper selection of vaccinator ; (*b*) proper selection of the vesicles from which lymph is to be taken; (*c*) purity of the lymph so taken; (*d*) cleanliness of the instrument used in operation; and (*e*) the health of the child to be vaccinated."

In the *Cuttack* Town of 39 persons vaccinated, 32 or 82·05 per cent. were successfully operated on. The Civil Hospital Assistant says that the vesicles produced by bovine lymph were more characteristic and typical than those obtained by employing humanized lymph.

Puri.—Although the lymph received in this Town was, with the exception of one supply, clear and fresh looking, of 20 operations performed with it not one succeeded. Mr. Lyons, the Civil Medical Officer, thinks that the failure is attributable to impairment of the virus by heat during transit, as the contents of the tubes were quite dry.

In the *Ranchi* Town the first supplies gave partial success, and the lymph in these cases was very gelatinous and rather dark in colour; but all the operations with subsequent supplies in February and March proved successful. The lymph this time was found to be more fluid. From the most suitable vesicles in these cases points were prepared and vaccination propagated by the arm-to-arm process. The Civil Surgeon, Dr. Wilson, says:—"I cannot say that I see any difference in the result, and there is the great disadvantage in the bovine lymph becoming gelatinous in the warm weather. The bovine lymph when humanized seems to act just as well, and the vesicle to have the same diameter as that obtained from ordinary humanized lymph."

In the *Chyebassa* Town of 15 persons vaccinated, 11 or 73 33 per cent. were successfully operated on. After this arm-to-arm vaccination was carried on, but no record was kept as to the number of the successful cases with lymph taken from the 11 cases above mentioned, as humanized lymph was also employed. The vesicles are said to have been well formed and good sized with good areola, and did not rupture or turn into sores. This lymph had, however, one drawback, viz., that it was not of uniform quality; in several tubes it had become dry or stringy. It was, however, noted that when the lymph did succeed the result was very satisfactory.

Places in which trials of Bovine Lymph entirely failed or were abandoned.

212. In the following Towns attempts made to vaccinate with bovine tube lymph to a more or less extent failed completely: Midnapore, Beauleah, Chittagong, Patna, Dinapore, Gya, Mozufferpore, Balasore, and Purulia; and in the following the first trial having failed, further attempts were abandoned: Birbhum, Jessore, City Murshidabad and Purneah.

Howrah.—This Municipality, acting under the advice of the Civil Surgeon, declined to avail itself of calf vaccination; but the Government being satisfied that the difficulties under which the Vaccination Department labours are sufficiently great, and that if its efforts in this direction are to be thwarted by Municipalities acting under the advice of Civil Surgeons, its task would be almost hopeless, and that as bovine vaccination had made considerable progress, and is no longer in the stage in which the preferences or prejudices of individual officers can be allowed to retard its general acceptance, directed that the Civil Surgeon be instructed to render the Vaccination Department all the assistance in his power. It has since been arranged that bovine vaccination shall be adopted in this Municipality.

Value of work done with Bovine Lymph.

In the Metropolitan Circles.

213. Besides supplying calves to the Calcutta Corporation and the Suburban Municipality, as already mentioned, requisitions for virus from public officers and private parties were complied with, and vaccinated calves were sent to Akyab, where animal vaccination has been established. During an outbreak of small-pox in the Baranagore Municipality, two calves were sent there, and many persons were at once vaccinated, with the result that the disease was arrested. A calf was sent to a vessel, which arrived with small-pox, and was detained off Diamond Harbour, for the vaccination of her crew. On the occurrence of small-pox in the General Hospital, all its inmates were vaccinated direct from the calf. During the recess plentiful supplies of lymph were sent to the districts in which small-pox occurred, for the purpose of vaccinating the unprotected. Such a copious supply of virus was never available during this period, when the practice of supplying humanized lymph was in vogue, and this lymph was kept up with difficulty by the arm-to-arm process. It was observed that the prejudice against calf lymph entertained by the Hindus was dying out. A large number of them attended the depôt this year for calf vaccination; native gentlemen even from the extreme end of Howrah applied for calves to vaccinate their children; and a Brahmin gentleman in Bally refused to have his child vaccinated from any other than calf lymph. Dr. Ghose, the Officiating Superintendent, made all the Deputy Superintendents under him practise vaccination on calves, and observe the character of the vesicle in its different stages. All the above shows that very useful and commendable work was done during the year. Dr. Ghose notes that his acknowledgments are due to Assistant Surgeon Jogendro Nath Bhattacharjee for the zeal and interest with which he managed the Central Depôt, and he well deserves them.

Under sanction of Government, the following modifications have been made in the working of the Bovine Vaccination institution. In future lymph will be supplied to and distributed throughout the Province. The vaccination of the Town of Calcutta and its Suburbs, and the expenses connected with it, will devolve on the Municipalities in question, the Government establishment still continuing to attend to private families in their houses, charging a fee of eight annas on each child operated on, and the cost of carrying the calf. The whole time of a Resident Assistant Surgeon being no longer required for supervising the work, it has been arranged to place the Establishment under the general supervision of the Deputy Superintendent of Vaccination in charge of the Suburbs; to employ a Resident Inspector; to reduce the number of the vaccinators from four to three, thus effecting a reduction of Rs. 59 per mensem; and to remove the Central Vaccination Depôt to the Suburbs to ensure better stabling accommodation and pasturage for the calves.

In Calcutta.

214. It is reported that in *Calcutta* the Bovine Vaccination Scheme has been a source of great convenience. It has not only lessened the difficulty hitherto felt in supplying virus to the Southern Division of the Town, but has also facilitated the carrying out of operations in the Northern Division in large numbers. The demand for calf lymph by Natives has also greatly increased, so that it is hoped that hereafter animal virus will do away with the practice of arm-to-arm vaccination—a practice objected to in many cases, both by Natives and Europeans.

WORK OF THE YEAR.

Total number of Vaccinations performed.

215. The subjoined table furnishes this information in comparison with the results of the preceding year:—

CIRCLES.	TOTAL NUMBER OF VACCINATIONS PERFORMED. In 1884-85.	In 1883-84.	DIFFERENCE IN 1884-85. Increase.	Decrease.
Calcutta	15,955	9,538	6,417	...
Metropolitan Circles	366,139	342,543	23,596	.
Bovine Vaccination Department, Calcutta	4,760	3,310	1,450	
Suburbs of Calcutta including Cooly Depôt	15,021	11,397	624	
TOTAL OF METROPOLITAN CIRCLES	385,920	360,250	25,670	.
Darjiling Circle	229,560	221,536	8,024	..
Ranchi "	148,972	146,283	2,689	...
Sonthal Pergunnahs "	123,048	106,985	16,063	..
Eastern Bengal "	397,079	351,016	46,063	.
Orissa "	46,971	52,542		5,571
Behar "	54,755	39,627	15,128	...
TOTAL OF VACCINATION CIRCLES	1,402,260	1,287,777	114,483	...
Municipalities, Dispensaries, &c.	86,036	76,865	9,171	
GRAND TOTAL	1,488,296	1,364,642	123,654	

This table shows that the aggregate number of vaccinations performed during the year under review amounted to 1,488,296 against 1,364,642 during the preceding year, and that of this number the Vaccination Circles returned 1,402,260 operations against 1,287,777 in 1883-84 and the Municipal area 86,036 against 76,865. There was thus an increase of 114,483, operations in the Vaccination Circles, and of 9,171 in the Municipal area, or an aggregate increase of 123,654 operations, indicating very considerable progress in the work of the year. To this improvement all the Circles, excepting Orissa, as well as the Municipal area, contributed. Gauged by the percentages of increase of operations performed this year over the outturn of the preceding year, the Circles which exhibited improvement rank in the order of merit assigned to them in the margin. Distributing the Municipal work to the Vaccination Circles, within the area of which the institutions are respectively located, the following results are obtained.

	Excess percentage of operations in 1884-85.
Calcutta	40·21
Behar Circle	27·62
Sonthal Pergunnahs "	13·05
Eastern Bengal "	11·60
Metropolitan "	6·65
Darjiling "	3·19
Ranchi "	1·80

CIRCLES.	Total number of Vaccinations.	PRIMARY VACCINATIONS. Total.	Number successfully vaccinated.	Percentage of successful operations.	RE-VACCINATIONS. Total.	Number successfully vaccinated.	Percentage of successful operations.
Metropolitan	418,238	409,833	406,860	99·57	8,405	4,089	54·89

Behar	75,301	74,837	71,773	97·31	464	184	54·47

The reduction of work in the *Orissa* Circle is attributed to "the Balasore and Puri districts having been excluded from the areas selected this year, and also to vaccine operations having been stopped during the middle of the season in the areas selected, viz., Juggutsingpur and Tirtol thannahs of the Cuttack district, owing to an outbreak of cholera." It may, however, be noted that the work of one vaccinator in this circle for February and March was not furnished, and does not, therefore, find a place in the summary of the year. The advance made in *Calcutta* was due to a larger establishment having been at work, and to vaccinations having been carried out throughout the year. The substantial improvement seen in the work of the *Metropolitan* Circles was effected in the face of the facts that work which had commenced in the Burdwan, Nuddea, Birbhum and Murshidabad districts had to be abandoned owing to the distress which prevailed in those districts from failure of crops, and that great difficulties had to be contended with in carrying on work with a disorganized establishment in the Suburbs of Calcutta, reference to which has already been made, as well as in the Vaccination Circle, which will be alluded to in a subsequent portion of this Section of the Report. The action which

materially helped to produce a good outturn of work was the early establishment of lymph, which enabled the season's work to be begun at its very outset. The observations made above relating to disorganization of establishment and early commencement of operations, also apply to the *Ranchi* Circle, *vide* paragraph 180 of this Report. Here, however, there was a decrease in the number of vaccinations accomplished by the Government vaccinators to the extent of 2,892 operations. This is wholly due to the resignation of an entire party of vaccinators from causes also mentioned in the paragraph quoted above, whereby work was entirely stopped in the area which had been assigned to them. In the *Darjiling* Circle the increase in the number of operations was effected by the *Licensed agency*, as there was a small falling off in the number vaccinated by the *Government* agency, viz., to the extent of 826 operations. This is attributed by the Superintendent to paucity of subjects to operate on "the field having been cleared in past years," and to the presence of "fewer immigrants" in the area of work. In the *Sonthal Pergunnahs* Circle, both the Government and licensed agencies contributed to the enhanced work of the year, the former to a much greater extent than the latter. But some portion of the increase in the number of operations must have been caused by work having been carried on largely during the recess to suppress outbreaks of small-pox in the Sonthal Pergunnahs, Bhagulpore and Monghyr districts. At any rate the present Superintendent, Assistant Surgeon Kally Prosonno Ghosal, appears to have exerted himself more than his predecessor. In the *Eastern Bengal* Circle also both agencies produced the improvement, particularly the Licensed. The increase in the work of the Government agency is ascribed by the Superintendent to "the moral characteristics of the people among whom the vaccinators worked, as also (but in a subordinate sense) to the zeal of the men employed," and in that of the Licensed agency to the extension of operations in the Mymensing district. It should be mentioned here that the returns of 6,891 operations by Licensed vaccinators were received after the March returns had been closed and the year's summaries made. These figures will be included in next year's report. The improvement seen in the work of the *Behar* Circle was entirely due to the extension of the Licensed system to the Patna district, whereby 83 additional vaccinators (Licensed) were in the field of operations and produced 17,020 vaccinations, for the Government staff, of the same strength as in the preceding year, returned reduced work, the decrement being represented by 1,892 operations. The reasons assigned by the Superintendent for this reduction are:—(1) That a fresh field was taken up for operations in Shahabad, in which great opposition to vaccination had to be contended with, the people being impressed with the belief that a tax would be imposed in connection with vaccination as has been done for water supplied from the irrigation canal which was in the beginning given gratis; and (2) that the interference of inoculators was very great, alleged to have been due to the Magistrate of Shahabad having passed an order on the application of the malis or inoculators, that they shall be permitted to vaccinate the people, and that the Police should not interfere with their work. The consequence was that the inoculators obtained a copy of this order and exhibiting it to the people induced them not to have themselves vaccinated by the Government vaccinators. It appears that as far as could be ascertained these inoculators worked in 129 villages in thannahs Arrah, Belowti, Buxar, Doomraon, Peroo, and Dhangaon in Shahabad, where the Government vaccinators were also at work, and that no less than 42 of them were practising inoculation under cover of their licenses, even in thannahs Arrah and Belowti, where the prohibitory law is in force. Some of them were prosecuted, but the majority of them could not be detected, mostly because they plied their trade among rich families, and the matter was kept secret. This order of the Magistrate is most unfortunate, as it has had the effect of thwarting the efforts of the Government vaccinators to protect the country. I have asked the Magistrate to furnish me with a copy of his order, and will submit the case specially for the orders of Government. *Suburbs of Calcutta.*—It has been usual to include the vaccinations performed in the Cooly Depôts at Sealdah and Entally, this year amounting to 4,257 against 4,246 in the preceding year, with the figures of the Suburbs of Calcutta; but Dr. Ghose, the Officiating Superintendent of Vaccination, Metropolitan Circles, points out that it is not advisable to do so,

because the coolies do not form any part of the population of the Suburbs, and the protection given to them does not, properly speaking, signify protection to the population shown in the census tables as appertaining to the Suburbs. In illustration of this fact, he notes that in 1883-84 protection was stated to have been given to 44·51 per 1,000 of the Suburban population; but as the operations in the Cooly Depôts amounted to more than one-fourth of the whole work, the value of the above proportion is vitiated by 11 per 1,000. The Officiating Superintendent also reported that on examining the registers he found that of the 10,151 operations returned in 1883-84, as having been performed in the Suburbs of Calcutta, 1,604 could not be found in them. With reference to this discrepancy, Dr. Gupta, on rejoining his office, explained that the cause of not finding the operations entered in the registers is that some of the old vaccinators who had been dismissed did not make over their books to the vaccinators, who were appointed in their places, and that two registers of the Alipore and Russa Jails had not been compared by Dr. Ghose. These he forwarded, and they show 646 vaccinations. Another register, he says, in which, according to the *notes* of the Town Inspector, the balance 1,158 cases were entered, and which register was kept up by an Inspector, was seized along with other household papers by the Police when the Inspector in question was charged with a criminal offence. The explanation is not quite satisfactory.

Increase or Decrease of Vaccination in the Municipalities.

216. The subjoined table indicates, on the one hand, those Municipalities in which progress in vaccination had been effected, and, on the other hand, those in which reductions in operations had occurred:—

MUNICIPALITIES WHICH EXHIBITED IMPROVEMENT.			MUNICIPALITIES WHICH EXHIBITED REDUCTION.		
Districts.	Total number of the Municipalities, &c., in the districts.	Increase as compared with 1883-84.	Districts.	Total number of the Municipalities, &c., in the districts.	Decrease as compared with 1883-84.
24-Pergunnahs	16	3,530	Tipperah	3	1,897
Midnapore	6	3,347	Patna	5	1,687
Dacca	3	2,080	Faridpore	5	1,508
Monghyr	3	1,697	Gya	6	1,440
Pubna	2	1,673	Howrah	2	801
Cuttack	8	1,609	Murshidabad	4	638
Balasore	1	1,097	Sarun	6	615
Khulna	4	875	Noakholi	2	490
Mymensing	8	810	Chittagong	3	469
Southal Pergunnahs	4	527	Hughli including Serampore ...	8	414
Rajshahye	3	447	Chumparun	6	330
Bhagulpur	2	429	Darjiling	2	271
Backergunge	5	391	Burdwan	6	229
Bankura...	2	362	Maldah	3	224
Bogra	4	321	Shahabad	8	100
Manbhum	4	302	Puri	1	90
Jessore	4	259	Lohardugga	3	34
Mozufferpur	5	233	Rungpore	2	28
Hazaribagh	3	205	Nuddea	9	2
Dinajpur	1	140			
Singbhum	1	67			
Julpaiguri	3	25			
Durbhanga	5	11			
Birbhum	1	8			
Purneah	1	3			

It will be seen from this table that the majority of the Municipalities, 99 out of 180 exhibit improvement in vaccination, and that the Municipalities which made the greatest progress were those located in the districts of the 24-Pergunnahs, Midnapore, Dacca, Monghyr, Pubna, Cuttack and Balasore. This advancement is traceable, in the first place, to the action of the Compulsory Vaccination Act, which will be explained in the portion of this Section of the Report dealing with the working of this enactment; in the second place, to the supervision of vaccinations in Municipalities other than those in the Sudder Stations having been vested in the Superintendents of Vaccination, by which the work was not only better supervised, but operations were also carried on in a larger number of these institutions during 1884-85 than during the preceding year, the increase being 35; and, in the third place, to several of the Civil Surgeons having evinced much care and attention when inspecting the work of the vaccinators, which induced them to be more active in the performance of their work. In the *Dacca* town the great increase in the number of operations (more than double that of

the preceding year) was attributed to the vaccinators being paid by results, and to their being permitted to find subjects for operation in any part of the town instead of, as in former years, in portions which had been assigned to each vaccinator, and also to the presence of a small-pox epidemic, which drove the people to resort to the prophylactic in large numbers.

On the other hand, the Municipalities which exhibited the largest reductions in operations were those in the Tipperah, Patna, Farridpore, Gya, Howrah, Murshidabad and Sarun districts. The causes of the depreciation briefly stated are—Employment of vaccinators for short periods, one, two, or three months at most, which by lessening the duration of the vaccinating season precludes a larger amount of work being done; failure of first supplies of lymph retarding the commencement of operations; presence of sickness suspending work; objection to part with lymph from the arm resulting in want of vaccinifers; inexperience, apathy, neglect of vaccinators, decrease or change in their number; close examination of the work of the vaccinators by Inspecting Officers preventing them from showing up more work than is actually performed; the Compulsory Vaccination Act allowing a limit of 12 months for vaccination, so that children born within that period cannot be operated on, if the parents are unwilling, which they generally are, &c. I should mention here that the work done in outlying Dispensaries is nominal, for the Civil Hospital Assistants or others in charge of these institutions cannot go about seeking for subjects to operate upon, and therefore operate only on children brought to the Dispensary at the wish or option of their parents or guardians. The inspections of the operations are also materially interfered with, as the children are rarely brought to the dispensary for this purpose.

Vaccination in the Port of Calcutta.

217. As usual the crews of the Maldive boats and Arab buglas were vaccinated, and an attempt was made to afford protection to lascar crews arriving in Port, it having been reported that small-pox is of frequent occurrence among them after leaving London. Vaccination returns of seamen operated in the Port of Calcutta are not submitted, it not being feasible to do so, as with such a shifting population as that in the Port it will always be difficult to get the results of vaccine operations, especially under the provisions of the present Vaccination Act, which allows a limit of 15 days within which the notices served may be complied with. Before the expiration of the time many vessels will have left, or the crews dispersed, or those who have been vaccinated have proceeded to sea before the result could be known. In illustration of this fact the Health Officer reports that between the 4th of March and the 28th of May he served 362 notices to the crews of 17 vessels, of whom only 141 submitted to the operation. These vessels were in Port from 3 to 14 days; in two cases 17 days; in one case 18 days, and in one case 21 days.

218. *Primary and Secondary Operations during* 1884-85.

* Particulars according to Sex of these operations cannot be furnished as no record was kept of them.

Coincident with the progress in total vaccination, there was an increment in the number of the primary vaccinations, amounting to 124,058 operations, which was shared by the Vaccination Circles to the extent of 114,976 operations and the Municipal area by 9,082 operations, Orissa alone exhibiting a decrease of 5,478 operations In re-vaccinations there was on the whole a diminution of 404 operations. The largest decrease is seen to have occurred in the Ranchi circle, which, however, was balanced to a considerable extent by increase in Calcutta, due, the Superintendent says, to a larger establishment having been at work, for reasons explained in a preceding portion of this Section.

Grand Total ...	14,57,105	5,489	13,25,697	6,107	99·38	48·22	98·06	52·58

From this table it is seen that in primary vaccinations approved rates of success were achieved by the Metropolitan, Darjiling, Eastern Bengal, Sonthal Pergunnahs, Ranchi and Behar Circles, the two last named circles exhibiting a higher standard of success than in the preceding year, and the rest slightly varying ratios. On the other hand, the Calcutta and Suburban Circles returned lower ratios. Although a slight improvement was effected in the Orissa Circle and in the Municipal area, the rates of success returned were again inferior. The cause of depreciation in primary successes in Calcutta is said to be due to the results in a large number of cases not having been ascertained; and in the Suburbs of Calcutta to closer inspection of the cases.. In the Municipal area the chief causes of low rate of success are, not trusting to the reports of the vaccinators but strictly examining the cases, and frequent failures of lymph. In several Circles the rates of success in re-vaccination are manifestly wrong. Dr. Ghose, the Officiating Superintendent of Vaccination, Metropolitan Circle, says with regard to the high percentage of success in re-vaccinations in his Circle that, it is due to the fact that most of those who are inoculated are not actually protected, as inoculation, as practised in this country, very often gave a spurious sore, which was taken for successful inoculation.

220. *Average number of Operations performed by each Vaccinator.*

Circles.	Number of Vaccinators.		Number of operations per man.		Difference in 1884-85.

The figures in this table indicate increased energy on the part of the vaccinators of the Darjiling, Ranchi, Metropolitan and Eastern Bengal Circles, as well as of the Municipal area as a whole, as opposed to a decline in the work of the operators in the Behar and Orissa Circles, in the Suburbs of Calcutta, in the Sonthal Pergunnahs Circle, and in Calcutta in the order mentioned.

221. *Comparative Amount and Value of Work performed by the Government and Licensed Agencies during* 1884-85.

Agencies	Circles in which employed.	Number of Vaccinators employed.	Total number Vaccinated during the year.	Primary Vaccination.					Re-vaccination.					Percentage of successful cases.		Average number of Persons vaccinated by each Vaccinator.	Proportion of Persons successfully Vaccinated per 1,000 of Population.
				Total.	Successful.				Total.	Successful.							
					Under one year.	One year and under six years.	Above six years.	Total at all ages.		Under one year.	One year and under six years.	Above six years.	Total at all ages.	Primary.	Re-vaccinations.		
Licensed.	Metropolitan, Darjiling, Eastern Bengal, Behar, Sonthal Pergunnahs, Orissa and Ranchi	1,067	976,226	975,633	156,516	678,314	135,820	970,650	593	...	39	324	363	99·73	62·69	915	20·31
Government.	Calcutta, Suburbs of Calcutta, Darjiling, Eastern Bengal, Behar, Sonthal Pergunnahs, Orissa and Ranchi	329	421,274	414,912	42,816	248,907	116,385	408,108	6,362	...	45	1,772	1,817	99·50	33·57	1,280	8·57

The above and the following *four* tables do not include the 4,760 operations performed by the Bovine Vaccination Department in Calcutta, owing to no records having been kept of particulars relating to *Age*, *Sex*, and *Class* or *Religion*.

Increase or Decrease in the Work of the Licensed agency, as compared with that of the Government agency.

In primary vaccinations	560,721	*I*
„ successful	562,542	*I*
„ infant	113,700	*I*
„ vaccinations of children ...	429,407	*I*
„ ditto of adults	19,435	*I*
„ percentage of successful cases (primary)	·23	*I*
„ number of operators	738	*I*
„ operations performed by each vaccinator	365	*D*
„ proportion of population protected	11·74	*I*

The marginal summary of the figures given in the above table again shows that (eliminating the results of re-vaccinations, which are not quite reliable, particularly those returned by the Licensed vaccinators,) gauged by the primary vaccinations, by the successful infant vaccinations, by the vaccinations of children and adults, and by the standard in the rate of successful operations, the work performed by the Licensed agency was superior to that performed by the Government agency. In point of the number of operations performed by each of them, however, they exhibited less energy in comparison with the Government men.

222. *Vaccination according to Age.*

Circles.	Total number of persons primarily vaccinated in 1884-85.	Ages of the successfully vaccinated, 1884-85.			Proportion per cent. to total primarily vaccinated in 1884-85, excluding the unknown.			Proportion per cent. to total primarily vaccinated in 1883-84.

As usual, relatively, Children of one and under six years of age were the most largely protected, viz., at 67·02 per cent. on the total primary vaccinations, which amounted to 13 90,545; those above six years and Adults in the next degree (18·23 per cent.); and Infants under one year at the smallest rate (14·40 per cent.). Considering the circles individually, this feature in protection prevailed in the Metropolitan, Eastern Bengal, Orissa and Behar Circles, and also in the Municipal area but in Calcutta and its Suburbs, and in the Darjiling, Ranchi and Sonthal Pergunnahs Circles, while Children of one and under six years of age were as in the other Circles best protected, Adults ranked higher in the order of protection than Infants. Contrasted with the figures of the preceding year, improvement in the percentages of Infants and Children protected is seen to have occurred in all the Circles excepting, with regard to the former, in the Behar Circle only, and with regard to the latter in the Calcutta and Eastern Bengal Circles; but in vaccination of Adults a diminution in the percentages protected is observable in all the Circles, excepting Eastern Bengal and Behar. The causes accounting for Children of one and under six years of age being more largely protected than Infants have been furnished in my Report for the past year, and need not be recapitulated.

Calculated on the total number vaccinated, the proportion of males operated on exceeds that of females in every Vaccination Circle, as well as in the Municipal area, the aggregate percentages being 51·75 males against 48·24 females in the former area, 56·28 males against 43·71 females in the latter and 52·01 males against 47·98 females in both areas combined. In relation to populations, males were protected in larger proportion than females everywhere, except in Calcutta and the Suburbs; and on the whole 3·05 per cent. of the male population and 2·81 per cent. of the female received protection, the percentages in the Vaccination Circles being 3 03 males and 2·81 females, and in the Municipal area 3·41 males and 2·79 females. Contrasted with the preceding year, the percentages of both male and female operations calculated on the total number vaccinated were equal in both years. Calculated on population, there was an increase in the proportion of both sexes protected, viz, to the extent of ·12 per cent. in male population and ·11 per cent. in female population. The Circles which exhibited the most conspicuous increases and decreases in this direction were—

The figures in the above table indicate that, with reference to the gross numbers vaccinated, the largest proportion of the operations was performed on the Hindus (56·74 per cent.), next on Mahomedans (40·65 per cent.), third on those returned under the head of "Other races" (2·27 per cent.), and least on Christians (·32 per cent). This order prevailed in the Calcutta, Metropolitan, Ranchi, Behar, and Orissa Circles (eliminating "other races"); but in the Darjiling and Eastern Bengal Circles more Mahomedans than Hindus, in the Sonthal Pergunnahs more "Other races" than Christians and Mahomedans, and in the Municipalities more Christians than "Other races," were operated on. Relatively to populations vaccinated, the greatest protection was afforded to Christians (4·44 per cent.), next to Mahomedans (3·37 per cent.), then to Hindus (2·73 per cent.), and least to the "Other races" (1·86 per cent). The Circles taken individually show that, the Christians were better protected in the Metropolitan, Eastern Bengal, and Orissa Circles, and in the Municipal area, than in other Circles; the Hindus in the Ranchi Circle and in the Suburbs of Calcutta; the Mahomedans in Calcutta; and "Other races" in the Darjiling, Behar, and Sonthal Pergunnahs Circles. In Ranchi, however, an equal percentage of Christians to Hindus received protection. In comparing the results numerically with those of the preceding year, it is seen that of Christians an equal proportion was vaccinated, and that of Hindus and those shown under the head of "Other races" smaller numbers, represented by ·13 and 2·11 per cent., respectively, and that of Mahomedans a larger number to the extent of 2·30 per cent. were operated on. Relatively to population the results indicate an increase in the proportions of Christians, Hindus, and Mahomedans protected, with a decline in that of the "Other races", the increase being represented by ·70, ·08 and ·35 per cent. respectively, and the decrease by 1·52 per cent. In the subjoined table are shown the circles which afforded noticeably augmented or diminished protection to the several Classes of the population:

Increased protection.					Decreased protection.				
Circles.	Proportion per cent. to Population of—				Circles.	Proportion per cent. to Population of—			
	Christians.	Hindus.	Mahomedans.	Other races.		Christians.	Hindus.	Mahomedans.	Other races.

These figures demonstrate that of the estimated births of the year, taken at the low rate of 30 per 1,000 of Population, only 13·93 per cent. were protected by vaccination, leaving, after eliminating the loss by death, amounting to 9·65 per cent., the very large proportion of 76·40 per cent. of unprotected Infants; that in no Circle was the Birth-rate overtaken by the Infant vaccination ratio, and that with defective results throughout, the most unsatisfactory percentages of Infant protection were returned from the Orissa (4·38), Behar (5·18), Metropolitan (10·48), Sonthal Pergunnahs (10·95) and Eastern Bengal (11·32) Circles. Nevertheless, there was, it is satisfactory to find, an improvement in comparison with the results of the preceding year in the proportion of Infants vaccinated in every Circle, excepting Orissa, to the extent marginally shown in the order of progress effected, culminating, notwithstanding a decline of 3·58 per cent in the Municipal area, in an increase in Infant vaccinations to the extent of 1·61 per cent.

Extending the enquiry over a longer period, viz., from 1880-81 to 1884-85, for which there are *complete* data, the following table indicates the protection afforded to the general Population, and to the number born during these four years. The population has been adjusted by adding the Births of this period at 30 per 1,000 of population and eliminating the actual number of casualties that took place during the same time. The information in this

table will be more and more useful in proportion to the length of period to which it is extended :—

Circles.	Protection afforded to the General Population.					Protected afforded to the number Born.						
	Population.	Total number of Primary and Secondary operations during the four years 1881-82 to 1884-85.	Percentage of Population Protected during the four years 1881-82 to 1884-85.	Mortality from Small-pox. Ratio of Deaths per 1,000 of population in 1881-82.	Mortality from Small-pox. Ratio of Deaths per 1,000 of population in 1884-85.	Estimated Births at 30 per 1,000 of Population during the four years 1881-82 to 1884-85.	Number of Infants under one year who were Vaccinated during the four years 1881-82 to 1884-85.	Number of Infants under one year who Died from all causes during the four years 1881-82 to 1884-85.	Number of Infants under one year who remained Unprotected at the close of 1884-85.	Proportion per cent. on number Born. Of Infants who were Vaccinated.	Proportion per cent. on number Born. Of Infants who Died.	Proportion per cent. on number Born. Of Infants who remained Unprotected at the close of 1884-85.

The figures in the above table indicate that during the period under notice, on the whole, 7·43 per cent. of the Population were protected by vaccination; that the mortality from small-pox had fallen from ·26 per 1,000 of population in 1881-82 to ·24 per 1,000 in 1884-85; that the greatest degree of protection was afforded to the Population in the Suburbs of Calcutta, and the least to that in the Behar Circle; that 8·46 per cent. of the Infants born during the period had been protected; that the large proportions of 83·76 per cent. of the Births of the period remained unprotected at the close of 1884-85; and that Calcutta first, the Suburban Municipality next, the Ranchi Circle third, and the Darjiling Circle in the fourth place, excelled all the other Circles in affording protection to Infants; Behar showing the smallest amount of work performed in this direction.

* Includes one Assistant Superintendent.

General results of Inspection Work.

227. The above table discloses the following general results:—

(1) That 4,269 villages were visited by the Superintendents, 3,375 by the Deputy Superintendents, and 25,769 by the subordinate Inspecting Officers; and that these numbers contrasted with those of the preceding years show that 1,690 additional villages were inspected by the Superintendents and 6,369 by the subordinate Inspecting Officers, against diminution of 201 villages by the Deputy Superintendents.

(2) That numerically a larger number of Vaccinations were examined by Officers of all classes, the increase being represented by 43,918 by the Superintendents, 32,888 by the Deputy Superintendents, and 114,376 by the other Inspecting Officers.

(3) That in relation to proportion of Inspections to the total number of vaccinations, which in reality determines the merits of the Inspection Work performed, it is seen that Officers of every grade returned improved results, viz, to the extent of 2·43 per cent. of the total number vaccinated by the Superintendents of Vaccination (the percentages being 11·21 against 8·78 in 1883-84); 1·40 by the Deputy Superintendents (13·24 against 11 84), and 3·98 by the subordinate Inspecting Officers (55 99 against 52·01).

It is gratifying to find that there was generally a satisfactory improvement in Inspection Work, and I attribute this advance to the close check kept by me over the proceedings of the different officers month after month during the year. I now proceed to examine the work of each Officer, as far as the statistics and information furnished in the reports admit of this test.

Supervision Exercised by Sanitary Commissioner.

228. But, before doing so, I should mention that the orders of the Government of India, conveyed in paragraph 5 of Bengal Government letter No. 324, dated 31st January 1884, directing the Sanitary Commissioner to visit the Vaccination Circles, were observed as far as possible during the year under review. I visited during my inspection tours the Metropolitan, Darjiling, Eastern Bengal, and Orissa Circles, and personally communicated with the Superintendents of these Circles with regard to several particulars relating to Vaccination and Sanitary Work, &c., in their Circles. I have also closely scrutinized the monthly diaries of the Superintendents down to those of the Inspectors of Circles, commending good, and condemning bad work—Sanitary, Vaccination, Inspection and Registration—and pointing out the improvements that should be effected under each head. Notes of the action taken by me on these matters will be found interspersed in this Report. I am glad to be able to record that the result has been much improvement in every branch of the work. There has been a considerable increase in the number of Deaths registered, and of Vaccinations performed, *vide* paragraphs 3 and 215 of this Report; a very large amount of sanitary work has been performed by the officers of the Vaccination Department, *vide* next Section of this Report; and the inspections of the work of the subordinate by the Supervising Officers have been more close, and consequently attended with better results, as will be shown in the immediately following paragraphs. I must say, however, that this branch of the work is yet deficient in completeness.

Inspection Work in Calcutta.

229. *Superintendent Dr. J. O'Brien.*—In the hot weather, when large numbers were vaccinated in the bustees, the Superintendent made weekly Inspections of the cases, and in the cold weather he frequently saw cases in the Vaccine stations. During these visits he saw 762 operations, of which he found 747 successful. The percentage of his inspections on the total number vaccinated amounted to 4·77 against 2·99 in the preceding year, showing an increase of 1·78 per cent. Considering the large amount of other onerous duties he has to perform, the Inspection Work of Dr. O'Brien is very satisfactory; but still the small proportion of cases examined to the total indicates the necessity of having an Officer on this duty who can devote more time to it.

Deputy Superintendent—Assistant Surgeon Ram Chunder Mitter.—This officer's inspection work is represented by 46·74 per cent. of the total number vaccinated, being 4·29 per cent. in advance of the preceding year. Regarding his work the Superintendent submits the following observations: "Almost all the home and bustee vaccinations were inspected, but the station cases could not all be seen, because the date and hours of three or four stations being the same, they could not be visited every day; the attendance at the stations was very irregular, and many did not come at all, and so a large percentage had to be returned as not ascertained, and summonses or prosecutions could not be served on those who did not come, as they had given incorrect addresses, the intelligent class always avoided bringing the children back to the station for inspection during the lymph taking stage for fear of parting with the lymph; during the busiest part of the season the Deputy Superintendent is obliged to stay at home up to 8-30 A.M. to receive applications for private vaccination, and to attend to the other wants of the people, so that he could scarcely make it convenient to visit the stations, except those at his own house and at the Medical College."

Assistant Superintendent—Amirto Lall Roy, Civil Hospital Assistant.—This officer was appointed in the latter part of July. His work is represented by 14·24 per cent. of inspection of the total number vaccinated amounting to 15,955.

Inspection work in the Metropolitan Circles.

230. *Officiating Superintendent, Dr. Kristo Dhone Ghose.*—This officer visited 545 villages in the mofussil during a tour extending over 129 days, exclusive of breaks amounting to 53 days, caused by the Durga Poojah and other native festivals, and days spent in Office work. He examined a larger number of cases than were seen during the preceding year, viz., 27,026 against 25,624, yielding the percentage of inspections to total number vaccinated of 7·38, which is lower than that of 1883-84 by ·10 per cent. This slight falling off is attributed to the calculation being based on a larger number of vaccinations. In the *Suburbs of Calcutta* he visited all the thannahs and examined 3,015 operations, being 2,212 in excess of the number of the preceding year. His percentage of inspections to total number operated on in this area was 20·07, shewing an excess of 14·50 per cent. On the whole this Officer's Inspection Work is satisfactory, considering that he paid much attention to work in the large number of Municipalities which were placed under his supervision, and was engaged with me during the working season on an important sanitary enquiry in the district of the 24-Pergunnahs.

Deputy Superintendent, 1st Metropolitan Circle, Assistant Surgeon Neem Chund Gupta.—This officer visited 301 villages in the districts of 24-Pergunnahs, Jessore, and Khulna during his tour, which lasted 121 days. He inspected 11,338 vaccinations, or at 3·09 per cent. of the total vaccinations. This proportion is slightly in excess of that of the preceding year, viz., by ·39 per cent. The work performed by him is most unsatisfactory, but he is physically unfit for his present post. An account of his one month's work is sufficient to show that it is impossible to carry on vaccination with such an incapable officer. During January he was found to have spent 11 days in performing office work, when, in order not to hamper Inspecting Officers with such work, it was arranged by Dr. Ghose that all returns from the Inspectors should be sent direct to the office of the Superintendent and that all correspondence connected with the returns should take place direct with the Inspectors; to have occupied 10 days in travelling, or in making arrangements for travelling, while all the travelling actually done by him was about 40 miles by road and 120 by rail; and that during only 10 days he performed Inspection Work, and that in two thannahs of one Sub-division.

Deputy Superintendent, 2nd Metropolitan Circle, Assistant Surgeon Kasi Chunder Dutt.—This officer visited 705 villages in the districts of Birbhum, Nuddea and Murshidabad in 146 days. He inspected 38,299 operations, or 10·46 per cent. of the total work of the year, showing a decrease of ·38 per cent. He has lately been transferred to the charge of a Civil station.

Deputy Superintendent, 3rd Metropolitan Circle, Assistant Surgeon Jadub Chunder Ghose.—This Deputy Superintendent visited 250 villages in the Burdwan, Hughli, Howrah and 24-Pergunnahs districts during his tour, lasting

four months and 22 days. This number is below that of the preceding year by so much as 422. He inspected 40,168 vaccinations, being 10·97 per cent. of the total vaccinations of the year, and this proportion is in excess of that of the preceding year by ·1·54 per cent.

Deputy Superintendent, 4th Metropolitan Circle.—Two officers worked in this circle in succession (taking only the working season to account), viz., Assistant Surgeon Mohendro Lall Bose, from the 6th of October 1884 to the end of January 1885, and Assistant Surgeon Preumber Nath Mitter, from the 9th of February to the end of March 1885. The Inspection work performed by them is submitted below, the differences as compared with the preceding year being also exhibited :—

	Duration of tour.	Number of Villages inspected.	Difference.	Number of Vaccinations examined.	Difference.	Percentage of Inspections.	Difference.
	Days.						
Assistant Surgeon, Mohendro Lal Bose	90	365	95*I*	11,072	504*I*	3·02	·06*D*
Assistant Surgeon Preumber Nath Mitter	40	308	...	16,362	...	4·46	...
Total ...	130	673	403*I*	27,434	16,866*I*	7·49	4·41*I*

The work of Assistant Surgeon Preumber Nath Mitter was better than that of Assistant Surgeon Mohendro Lall Bose. The latter officer being found to be physically unfit for the active duty of supervising vaccination efficiently was transferred to the General Medical Department.

Inspectors.—Of the 39 Inspectors, the most satisfactory Inspection Work was performed by Haji Mahomed Jan Khan (99·45 per cent. of total vaccination) Jogendro Nath Ghose (98·37 per cent.), Koylash Chunder Mitter (97·63 per cent.), Ramnath Ghosal (97·62 per cent.), Haradhone Dutt (96·37 per cent.), Raghunath Chuckerbutty (96·09 per cent.), Troyluckho Nath Chuckerbutty (95·80 per cent.), Ram Chunder Chatterjee (95·79 per cent.), and Woomesh Chunder Chuckerbutty (95·76 per cent.). On the other hand, distinguished for bad work were Chooni Lall Chatterjee (62·05 per cent.), Bolye Chand Acharjia (58 51 per cent.). Saroda Prosad Banerjee 73·38 and Ram Charan Bhattacharjee (78·85 per cent.). The percentages of inspection of the rest of the Inspectors ranged between 79·4 and 94·79 per cent., and the mean percentage was 84·48.

Dr. Ghose during his inspection tour noticed that in the Midnapore district vaccination work was carried on very unsatisfactorily. The Inspectors had large jurisdictions with the work of which they could not cope. The Deputy Superintendent of this district had hitherto satisfied himself with seeing a number of vaccinated children. The vaccinators were all old inoculators and seemed to be wanting in method, and whether it was owing to their want of persuasive powers, or to obstinate resistance on the part of the people, they looked helpless in comparison to the ex-paid vaccinators employed in other districts.

Inspection Work in the Suburbs of Calcutta.

231. On the transfer of Assistant Surgeon Mohendro Lall Bose to the General Medical Department, Assistant Surgeon Preumber Nath Mitter, who was the Superintendent in this area, was promoted to the post of Deputy Superintendent of the 4th Metropolitan Circle, and Assistant Surgeon Jogendro Nath Bhattacharjea succeeded him as Deputy Superintendent of the Suburbs. There were thus two officers in charge of this area, viz., Assistant Surgeon Preumber Nath Mitter, from the 1st of October to the 8th of February, and Assistant Surgeon Jogendra Nath Bhuttacharjee, from the 9th February to the 31st of March. Both of these officers inspected the vaccinations performed in all the thannahs in the Suburbs, and the Work returned by them is exhibited below :—

	Number of cases examined.	Percentage of Inspections.	Difference.
Assistant Surgeon Preumber Nath Mitter ...	5,075	33·78	No separate data for each officer.
„ Jogendro Nath Bhuttacharjee	2,450	16·31	
Total ...	7,525	50·09	16·32*I*

The work of both the Officers is very satisfactory. Dr. Ghose reported that, before his incumbency, the vaccination work in the Suburbs was in a very

disorganized condition. This subject will be referred to in detail when dealing with the manner in which the Compulsory Vaccination Act was worked in Municipalities in a subsequent portion of this Section.

232. *Superintendent, Dr. J. J. Wood.*—This officer visited only 155 villages situated in the districts of Darjiling, Rajshahye, Bogra, Rungpore, Dinajpur, Julpaiguri and Purneah Details of his inspection work are subjoined, and the differences in comparison with the work of the preceding year are also shown—

Inspection Work in the Darjiling Circle.

	Number of Villages visited.	Difference.	Number of Vaccinations examined.	Difference.	Percentage of Inspections.	Difference.
Paid Agency ...	17	2*I*	639	598*D*	4·79	3·95*D*
Licensed „ ...	138	38*I*	3,745	52*D*	1·73	·10*D*
Total ...	155	40*I*	4,384	650*D*	1·91	36·*D*

Judged by these figures it is seen that this Superintendent performed his Inspection Work very unsatisfactorily, although during the course of the season I addressed him on the subject of his remissness in the matter. It appeared moreover from his Diaries that he failed to inspect vaccination in thanahs in several districts when marching through them. This is the second season I have had to comment unfavourably on the manner this Officer supervises the vaccination work of his Circle. The result of this neglect is that the protection of the country is not progressing, as evidenced by the frequent occurrence of small-pox in the districts.

Deputy Superintendent, Moulvi Tajumul Hossein.—This officer was out on inspection duty throughout the season. He visited 354 villages in the Purneah, Julpaiguri, Dinajpur, and Maldah districts and in the Terai sub-division of the Darjiling district, and examined 8,815 vaccinations, or at the rate of 4 07 per cent. of the total vaccinations. In comparison with the work of the preceding year, there was a diminution in the number of Villages visited of 107, in the number of Cases seen of 524, and in the percentage of Inspection of ·43 per cent. I concur in opinion with the Superintendent that this Officer "maintained his character for energy," and that " he evidently tests the cases he sees severely." Still I think that more work could have been performed by him.

Deputy Superintendent, Assistant Surgeon Norendra Nath Gupta.—This officer visited 244 villages in the Rajshahye, Rungpore and Bogra districts. The observations made with regard to the Village Inspections of the Superintendent also apply to this Officer. There was a break in his tour of 17 days, caused by his having come down to Calcutta for examination for promotion to a higher grade. He inspected 7,883 vaccinations, which yields the percentage to total number vaccinated of 3 64. In comparison with the work of the preceding year there was a diminution in the number of Villages visited of 17, in Cases seen of 2,390, and in percentage of Inspections of 1·31. It is thus seen that this Officer's work was altogether very unsatisfactory, as he had a much more populous country to deal with than the other Deputy Superintendent. His diaries also disclosed that he only visited the localities most convenient to himself, and this course of conduct seems to have been overlooked by Dr. Wood.

Head Vaccinator, Mothura Nath Sen had the supervision of the Government vaccinators who worked in the Hill portion of Darjiling. In this area, comprising thannahs Darjiling, Kurseong and Kalimpong, he visited 186 villages and inspected 8,097 cases, being at the rate of 65·60 per cent. of the total number vaccinated. This is commend able work.

Inspectors, the Superintendent ranks the Inspectors of the Licensed vaccinators in the order of merit indicated below:—

1*st.*—Chunder Coomar Mukerjee of Rungpur; 2*nd*, Sodoruddin of Rajshahye; 3*rd*, Nubiruddin of Rungpur; 4*th*; Mir Bahadoor Ali of Maldah; 5*th*; A. C. Chuckerbutty of Bogra; 6*th*, Mohima Churn Chatterjee of Purneah; 7*th*; Messiruddin of Rajshahye; 8*th*, Sherajuddin of Purneah; 9*th*, Hedayutullah of Dinajpur; 10*th*, Shakatullah of Dinajpur; and 11*th*, Mohiuddin of Julpaiguri. The last named Officer was reported as stupid and old, and has been dismissed. Numbers 9 and 10 are not so efficient as the rest, and number 9, Inspector Hedayutullah, spent nearly the whole of January in Dinajpur and

in the sudder thanah. It is evident that he was merely passing his time in the manner most convenient to himself, and that he was permitted to do so from want of supervision and attention to the matter by the Superintendent, who should have insisted on regular inspection of all the vaccinations. He has been transferred to another district.

Inspection Work in the Ranchi Circle.

233. *Superintendent Dr. W. Owen.*—This officer visited during his tour, without a break, of 167 days, 479 villages in 53 thannahs in the districts of Hazaribagh, Lohardugga and Singbhum, and in the Sirguja Political State. Eliminating 1,305 operations from his inspections, which he says were so recently performed that no opinion could be pronounced on them one way or another, his work stood as set forth in the subjoined table, the differences in comparison with that of the preceding year being also exhibited :—

	Number of Villages visited.	Difference.	Number of Cases examined.	Difference.	Percentage of Cases inspected.	Difference.
Government Agency ...	479	86*D*	14,172	7,140*I*	42·28	22·53*I*
Licensed " ...			13,819	227*D*	12·04	·92*D*
Total ...	479	86*D*	28,291	6,913*I*	18·99	4·38*I*

These figures show that a good season's work was performed, and that this was achieved in the face of the almost insurmountable difficulties referred to in a previous portion of this Report is very creditable to Dr. Owen.

Deputy Superintendent, Assistant Surgeon Prosono Coomar Dey.—This officer visited 501 villages in 14 thannahs in the Manbhum and Singbhum districts. This area was assigned to the Deputy Superintendent, and was not traversed by the Superintendent. There were breaks of several days in this officer's tour, during which he was in Calcutta for examination, or at head-quarters performing Office work. During the 181 days he was on duty he examined 11,932 operations, representing 10·39 per cent. of the total vaccinations. In comparison with the work of the preceding year there is an increase of 125 villages visited, and a decline in the number of cases inspected of 144, or of ·67 per cent. on the total operations of the year. This is not quite satisfactory. With reference to this Officer's work, the Superintendent remarks that his returns were not sent in according to rules; that some particulars were omitted in his report, such as the names of thannahs visited by him; that he appears to have spent 150 days inspecting in Manbhum in 10 thannahs, and to have seen in that time 5,506 children; whereas he spent only 28 days in four thannahs in Singhbum, and saw 6,426 children; and that consequently he could certainly have inspected more cases in Manbhum as well as in Singhbum, where the vaccinators required to be looked after very much. The neglect of the latter district is clearly due to its being rather distant from the Deputy Superintendent's head-quarters.

Inspectors and Native Superintendents.—The percentage of vaccination inspected by these Officers ranged from 44·34 to 83·14 on the total operations of the year, the mean ratio being 67·14. Many of these Officers returned unsatisfactory work from causes which it would be tedious to detail here; but the following officers were favourably mentioned by the Superintendent, Fazel Kurrim, Mahomed Lall, Bunsidhur, Mohamed Ali Khan, Behari Lall, and Chatoorbhooj Lall.

Inspection Work in the Sonthal Pergunnahs Circle.

234. *Superintendent, Assistant Surgeon Kali Prosunno Ghosal*—This officer joined his appointment on the 15th of May 1884, and from the 22nd of that month he commenced his inspection tour, which lasted up to the 31st March, with the following breaks: 1st to 3rd October 1884, employed in examining the Inspectors and Head-vaccinators in hygiene, and 29th to 31st March, engaged in preparing the Annual Report. He was actually on duty 306 days. During this period he visited 1,002 villages in 23 thannahs, in the district of Bhagulpore, Monghyr and Sonthal Pergunnahs. The details of his Inspection Work are subjoined, the table also showing the differences in comparison with the work of the preceding year. It should be stated that this comparison is made with the work of the late Deputy Superintendent, who in reality

performed the Inspection Work, the then Superintendent being unable to do so from causes already explained :—

	Number of Villages visited.	Difference.	Number of Vaccinations inspected.	Difference.	Percentage of Inspections.	Difference.
Government Agency ...	621	435*I*	18,092	11,614*I*	32·46	16·59*I*
Licensed " ...	381	73*D*	9,680	4,962*D*	14·37	7·69*I*
Total ...	1,002	362*I*	27,772	6,682*I*	22·57	2·86*I*

indicating satisfactory progress ; but it should be recollected that in the above Work is included a large number of the operations performed during the recess for the purpose of suppressing outbreaks of small-pox.

Inspectors and Head-Vaccinators.—The operations of these Officers show percentages ranging from 6·21 to 19·58. While none of these officers can be said to have performed even fairly satisfactory work, the following returned notably bad work:—Ram Churn Mukerjee (6·21 per cent. of total vaccinations), Monohar Dass (7·31 per cent.), Aughore Nath Sircar (7·72 per cent.), Uma Churn Gupto (9·12 per cent.), Bhagiruth Dass (9·67 per cent.), and Haradhon Sen (10·18 per cent.).

Inspection Work in the Eastern Bengal Circle.

235. *Superintendent, Mr. A. Lyons.*—This Officer did not begin his inspection tour before the 19th November, and no plan of inspections appears to have been laid down by him for the Deputy Superintendent. During his tour extending to 137 days, he inspected only 133 villages in seven thannahs in the districts of Tipperah and Noakholi, leaving the Licensed agency work and a part of the Government agency work to the Deputy Superintendent. Particulars regarding his work are furnished below, with the differences as compared with the preceding year. The comparison is instituted with the *total* work in 1883-84, *Government* and *Licensed*—

	Number of Villages visited.	Difference.	Number of Vaccinations examined.	Difference.	Percentage of Inspections.	Difference.
Government Agency	133	43 *D*	17,248	1,358 *D*	8·19	2·89 *I*

The work of this Superintendent is unsatisfactory, and even as set forth may be incorrect. I have been unable to check his proceedings in any way throughout the working season, as he has obstinately detained all his Diaries, except one for a few days in November. He should be removed from his present post as soon as possible.

Deputy Superintendent, Assistant Surgeon Doorga Das Roy.—This Officer appears to have been deputed in the early part of November 1884 to supervise work being done by the Government agency in Tipperah, instead of being made to look after the Licensed agency work in the areas assigned to him. He commenced work on the 16th October, and continued it up to 31st March with several breaks aggregating 48 days, and performed work during 160 days. The breaks were caused, it is said, by his proceeding to Dacca to draw his salary at the local treasury, being ignorant that he could draw it at any treasury in the Circle; but as three of these breaks extended to 14 days each, it is difficult to believe that the above was the real cause. He visited 347 villages in eight thannahs in Tipperah, one in Noakholi, two in Pubna, seven in Dacca, five in Faridpore, and two in Mymensing, so that the bulk of the Licensed vaccinations carried on in Mymensing, Pubna, Dacca and Faridpore, particularly in the two first-named districts, were left entirely without inspection. The above-named thannahs are nearly all on the banks of rivers, so that in order that he might travel in a boat for his own convenience, the Deputy Superintendent left the interior thannahs unvisited. He examined 21,891 operations, or at the rate of 5·51 per cent. of the total vaccinations, showing an increase of 4·84 over the percentage of the preceding year. The Superintendent says he is not satisfied with the Deputy Superintendent's plan of inspection, who, he thinks did not understand the position of his field of operations, and consequently the exact centres to which he should have proceeded to enable him to make a concentrated inspection, but the Superintendent apparently forgets that it was his business to have laid down the plan of proceeding.

Inspectors and Native Superintendents.—The percentages of Inspections returned by these Officers ranged from 3·87 to 9·17, so that none of these

Officers can be said to have done satisfactory work. The following observations have been made by the Superintendent on the work of these officers. Inspector Mahomed Idris performed a fair amount of work, and besides inspections he started Licensed operations in West Mymensing for the first time,—work which was beset with difficulties. This should have been done under the supervision of the Deputy Superintendent employed for the purpose of looking after the Licensed agency, and not have been left to an Inspector who was, moreover, on probation. Inspector Tomizuddin's work was insufficient, but he pleaded that he was sick, and he looked so, and he also had to start Licensed vaccination in East Mymensing. Native Superintendent Koylash Chundra Chatterjee had fallen off in his inspections. He had been promoted to his present post for good work, and the deterioration in his work was unexpected. Head-vaccinators Anand Chandra and Mohim Chandra Bhumick performed insufficient amount of inspections. The last-named officer has always returned deficient work, and he has been warned for the last time. Head-vaccinator Koylash Chandra Ghosh's inspections are greater in comparison with the preceding year, being the result of the frequent warnings he has had. They are, however, still below standard; but he had to bring up arrears, and he is constitutionally infirm. Head-vaccinator Radha Kishore Shaw (a passed pupil of the Dacca School of Medicine) returned the highest percentage of inspections, and he is an active and intelligent young man. Inspector Raj Mohun Malakar, although careful and reliable, did not attain a satisfactory standard in his inspections. Inspector Baikunt Nath Bhumick's inspections were below the expected percentage. Inspector Abdul Hamid's work was insufficient. He was, however, ill with fever and had fractured one of the bones of the fore-arm and dislocated the elbow joint. Head-vaccinator Chandra Madhub Dhur made a great advance in his inspections and his work is fairly good. Inspector Abdul Bari is zealous and active, but his work is insufficient, owing to his having lost much time in overcoming the prejudices of the Ferazis who abound in his area of work.

Inspection Work in the Orissa Circle.

236. *Superintendent, Mr. P. Veeriah Naidu.*—This officer visited 963 villages in all the 13 thanahs in the Cuttack district, and in the Khurda thanah in Puri. There were two breaks in his tour, one from the 9th to the 13th of November, during which he went to Juggutsingpur to enquire into an outbreak of Cholera there, and the other from the 27th January to the 2nd February, during which he was employed in Office work at head-quarters at the time of the Sanitary Commissioner's visit. He inspected 24,490 vaccinations or at 52·13 per cent. of the total operations of the year. Compared with the work of the preceding year, while there was an increase of 169 in the number of Villages visited, there was a decline in the percentage of Vaccinations inspected to the extent of 5·55. On the whole the Inspection work of this Superintendent was very satisfactory, and he ascribes his inability to have returned better percentage of inspections than during the preceding year to the greater portion of his time having been taken up in travelling between distant areas.

Head vaccinators.—Beyond stating that Head-vaccinator Bany Madhub Mookerjee failed to complete his Inspection duty, the Superintendent's report furnishes no account or statistical data regarding these Officers.

Inspection Work in the Behar Circle.

237. *Superintendent, Assistant Surgeon Mothura Nath Sen.*—This Officer visited 513 villages in 10 thannahs in the Shahabad and Patna districts, during his tour extending to five months and 24 days. Particulars relating to his Inspection Work are subjoined with the differences in comparison with the Work of the preceding year:—

	Number of Villages visited.	Difference.	Number of Vaccinations inspected.	Difference.	Percentage of Inspections.	Difference.
Government Agency	408	16*D*	12,020	1,226*I*	31·85	4·62*I*
Licensed „	105	.....	1,743	......	10·24	......
Total ...	513	89*I*	13,763	2,969*I*	25·13	2·20*I*

These figures show that, on the whole, progress has been made, but the Licensed agency work, which was for the first time introduced into this Circle, should have been looked after much better. If certain irregularities had not been permitted to exist in this Circle, better work would have been secured. Here the subordinate Inspecting Officers make no arrangement for the protection of the villages before the arrival of the vaccinators, the latter spend months in the same villages, again, more than one man works in the

same village, by which responsibility for bad work cannot be fixed. The thannahs in the Patna district, which were inspected this year, comprise only a small part of the district, and lie along the Railway line, and yet the Superintendent only saw 54 successful cases per diem. In explanation for not producing better work, the Superintendent submits that there were monthly breaks in his tour, caused by his having to return to head-quarters to draw the pay of the establishment, and to dispose of office work; that he had gone twice or thrice to the same areas in Shahabad owing to the people not consenting to vaccinate the children at one and the same time; that he had also to make house-to-house visitation, owing to the prejudices of the people against producing their children for inspection; and that he had to enquire into the sanitary condition of the villages, which occupied much time.

Inspectors and Native Superintendents.—The percentages of the Inspections performed by these Officers ranged between 9·95 and 29·27. Their Inspections cannot therefore be considered satisfactory. The Superintendent does not furnish any account of the work of these Officers, beyond stating that they had to spend much time in inducing those who resisted vaccination to accept it, which impeded their work to some extent.

In an outbreak of small-pox in the Town of Durbhunga, it appeared that the people were directed to take their children to the Dispensary to be vaccinated. I recommended that the vaccinator should proceed to their houses and protect the children there, and that by making proper arrangements the vaccinators can operate on the children of groups of houses, and so bring vaccination to the doors of the people. This procedure was the more necessary, as it is known that women will not take their children to Dispensaries for vaccination.

238. The reports of this year show that much attention was paid by many of the Civil Surgeons and some of the Assistant Surgeons in closely inspecting the work of the vaccinators. With regard to the Municipalities placed under the Superintendents of Vaccination, those placed under the Superintendents of the Metropolitan and Sonthal Pergunnahs Circles seemed to have received much attention in this direction, with the result that more attention was paid by the vaccinators to their duties. Close, commendable Inspection Work was performed by Assistant Surgeon Kali Prosono Chowdhry of Burdwan, Assistant Surgeon Radha Romon Ghose of Ranigunge, the Civil Surgeon and Assistant Surgeon of Bankura, Dr. Roy of Birbhum, Dr. Tomes of Midnapur, Dr. Gregg of Hughli, Dr. Beatson of Jessore, Assistant Surgeon Ackhoy Coomar Dey of City Murshidabad, Dr. Crombie of Dacca, Assistant Surgeon Anand Chundra Mookerjee of Noakholi, Dr. ffrench-Mullen of Tipperah, Dr. French of Patna, Assistant Surgeon Asder Ali Khan of Barrh, Assistant Surgeon Amulya Chunder Champati of Behar, Dr. MacLeod of Gya, Dr. Mathew of Mozufferpur, Dr. Shaw of Durbhunga, and Dr. Manook of Chaibassa.

Gross Expenditure.

240. The total cost paid by Government for vaccinations performed during the year amounted to Rs. 1,40,746-8 8, and of this Expenditure Rs. 73,663-9-0 represent the cost of the operations performed by the Government vaccinators, and Rs. 67,082-15-8 that of the establishment provided by Government for supervising the operations of the Licensed vaccinators. In comparison with the amount expended during the preceding year, the Government had to meet an additional expenditure of Rs. 13,997-4-9 for vaccination during the year under review. The cost of vaccination to the Municipalities amounted to Rs. 10,702-5-8, being greater than that of 1883-84 by Rs. 1,856-10-9. Thus the entire cost of the year for vaccination—Government and Municipal—comes to Rs. 1,51,448-14-4, which is greater than the entire expenditure of the preceding year by Rs. 15,853-15-6.

Average Cost of each Successful Operation.

241. The average cost of each successful operation performed by the Government vaccinators was 2 annas and 10 pie, and that by the Licensed vaccinators 1 anna 1 pie, aggregating 1 anna and 8 for both departments. The differences, as contrasted with the average cost of the preceding year, are an increase of 3 pie per case in the operations of the Government agency, against a decrease of 1 pie per case in those by the Licensed agency, culminating in the cost per case in both years being the same. The average cost of the Municipal operations was 2 annas 2 pie each, and this cost was in excess of that of 1883-84 by 1 pie per case. On the whole the entire operations of the year cost 1 anna 8 pie per case against the same average per case in the preceding year. In the Vaccination Circles individually considered, the cost per case (excluding the Bovine Vaccination Department where it stood at 1 rupee, 12 annas and 4 pie) varied, ranging from 8 annas 1 pie in Calcutta to 9 pie in the Eastern Bengal Circle. It was lower in the Ranchi, Calcutta, Behar, Suburbs of Calcutta and Metropolitan Circles, but higher in the Sonthal Pergunnahs, Orissa, Eastern Bengal and Darjiling Circles to the extent indicated in the margin.

Contributions to cost of vaccination from other sources.

242. In addition to the regular expenditure incurred for vaccinations in the Circles and Municipalities as exhibited in the table in paragraph 239, the following contributions were made in aid of the work:—

Rs. 100 for two vaccinators entertained by Government for the Angul Estate in Cuttack.

Rs. 115-2-6 paid by the Rajah of Durbhanga for one vaccinator for the Durbhunga Municipality, and one vaccinator for the Tajpore Dispensary.

Rs. 200 paid by the Rajah of Hutwa, for two vaccinators for the Hutwa Dispensary, one vaccinator for the Gopalgunj Dispensary, and one for the Bhori Dispensary.

Rs. 284-2-8 for two vaccinators for the Dhenkanal Tributary Mehals in Cuttack paid by the Rajah of the place.

Rs. 15 for one vaccinator for the Kurnafuli Tea Plantation paid by the Kurnafuli Association.

Rs. 10 paid by the Northern Bengal State Railway for a Licensed vaccinator for vaccinating the children of the Railway employés from Sara to Silliguri.

Rs. 170 paid by the East Indian Railway for vaccinating the Railway employés at the Jamalpore station.

Rs. 74-5-10 for a vaccinator for the Barakpore Cantonment paid from the Cantonment Fund.

Rs. 120 for a vaccinator for the Dinapore Cantonment paid from the Cantonment Fund.

Rs. 83 for two vaccinators for the Sursund and Tajpore Dispensaries, paid from the Dispensary Funds.

Rs. 30 being contribution for the cost of one vaccinator paid to the Puri Municipality from the Puri Lodging House Fund.

Explanations accounting for the increase in the gross and average cost of Operations.

243. *Calcutta.*—The increase in the gross cost for vaccinations is due to the entertainment of temporary and permanent establishments, the former for two months and the latter from July, for reasons already explained in this report. *Darjiling Circle.*—The increase in the gross and average cost of operations was due to the head-vaccinator's pay having been raised, and to an emergent vaccinator having been entertained for eight months, and to a portion of the pay of a peon undrawn in 1883-84 being charged to the accounts of this year. The charge for travelling allowance was also greater. *Sonthal Pergunnahs.*—In this Circle the average cost per each successful case would have been much greater, owing to the following causes, were it not that the gross cost was distributed over a much larger number of operations performed. The causes of increase in the gross cost are—the appointment of a separate Superintendent, of a clerk, and of a sweeper, and retaining an emergent staff during the recess to suppress outbreaks of small-pox in Bhagulpore and Monghyr. The total cost incurred for the latter purpose amounted to Rs. 6,084-4-5. *Eastern Bengal Circle.*—The cause of the increase in the gross and average expenditure per case is due to the appointment of a Deputy Superintendent, of two Inspectors and a peon, and to travelling charges having been greater under the Civil Travelling Allowance Code. *Orissa Circle.*—The cause of the increase in the average cost of each successful case is said to be "due to the Balasore and Puri districts having been excluded from the selected areas this year," thus decreasing the gross number of operations. *Behar Circle.*—The increase in gross expenditure is due to the pay of the Superintendent having been increased on promotion to the second grade of Assistant Surgeons, and to more vaccinators having been employed than during the preceding year.

Particulars regarding the Licensed Agency.

244. The areas, old and new, assigned to the Licensed vaccinators have been indicated in paragraphs 118-119 of this Report, and the extent and the quality of their operations in paragraph 221, where it has been shown that they performed very satisfactory work. I now add some noteworthy particulars regarding them.

In the *Metropolitan Circles* Dr. Ghose, the Officiating Superintendent of Vaccination, found that the Licensed vaccinators were not an organised body as they should be; that neither the Superintendent nor the Deputy Superintendents had any control over them; and that there was no register kept of them, nor an account of their distribution over the Circle. In fact, their appointment was in the hands of the Inspectors, which led to much abuse, the paying villages being given away for money considerations. On assuming charge of the office, Dr. Ghose endeavoured to rectify these irregularities, but the Clerks in the office could render him no assistance, and what assistance the Inspectors tendered was of a negative character, and thus the whole matter was left to be taken up next season. The only hold the office had over these men for securing punctual appearance was a security of Rs. 16 from each; but Dr. Gupta, before proceeding on furlough, sold off the Government Promissory notes in which the security money was vested, and returned the deposits to the vaccinators. Regarding the merits of the Licensed Vaccination System, Dr. Ghose writes:—"The Licensed System of operations in my experience is superior to the system of work with paid vaccinators, in so far as it ensures thorough protection. The licensed man knows that he will have to earn his livelihood from the people, and he persuades and coerces them to accept vaccination. He also knows that he will not be paid for unsuccessful cases, and therefore is careful in inserting lymph and selecting good *virus*. But its great drawback [and this calls for the consideration of Government] is that the difficulty of realizing fees is increasing. People are beginning to know that there is no law to compel them to pay the vaccinators' fees. Even if it were possible to go to a Civil Court, practically such a course could not be adopted by the vaccinators; they would have to institute hundreds of small cases for four annas and eight annas, and dance attendance at the Court to the

neglect of their work. While the vaccinator will be attending Court, his lymph would be dying out. But I doubt if any Judge would give the vaccinator a decree when the parties bring up the fact in defence that they did not want the operation, but it was forced on them." Deputy Superintendent Jadub Chunder Ghose reports that in many villages in thannah Habra, in 24-Pergunnahs, people objected to pay the vaccinators' fees, the majority being those who could afford to do so, but would not. At Autgurrah, in the 24 Pergunnahs, of 104 persons vaccinated the fee could not be realized from one. Refusal was also made in thannah Sahebgungo and Mongulcote in Burdwan.

In the *Behar* Circle the Licensed vaccinators, who were for the first time employed this year, could not write, so they entertained a man in each thannah to write up their registers and to prepare the monthly returns. This shows that the Superintendent appointed imperfectly educated men, and had not taken the trouble in previous years to get good men and train them.

Need for legalizing the position of Licensed Vaccinators.

245. In a special report, which was forwarded to Government with this office letter No. 7219, dated the 17th December 1884, Dr. Ghose suggested the advisability of inserting some clause in the Local Self-Government Bill, making the licensed vaccinators' fee realizable as a public debt by the village Unions, as he found that some of the Licensed vaccinators had not been paid their fees for September and October, and had to loiter for them in one locality, and did not therefore advance to fresh villages, thus leaving unprotected centres in various parts of the Circle which form dangerous foci from which small-pox spreads.

Connected with the subject under consideration, the Superintendent of the *Ranchi* circle says:—"Some legislation is required to punish men who vaccinate without a license or order from some recognized authority. The people being illiterate and extremely ignorant cannot understand the difference between successful and unsuccessful vaccination, hence there is great opportunity for a bad, unscrupulous man to deceive them to their great detriment, and to bring vaccination into disrepute. Further, the villagers, since inoculation has been prohibited by law, look on all vaccinators, Government or Licensed, as men sent by Government for their benefit, and hence it would be rare to find villagers asking a man by what authority he worked, and rarer still to find any one asking a vaccinator to produce his *parwana.* They would in 999 cases out of 1,000 be content with the answer that he was ordered to vaccinate their children, and that if they did not bring them, he would report them, and get them punished. He vaccinates them, takes excessive fees, and is quite unconcerned whether the cases are successful or unsuccessful. The people require to be protected from such men, and, as the law stands at present, it is inadequate to do so. Great difficulty is experienced in obtaining the services of good men. In many cases the department seems to be looked on as a *refugium peccatorum*, bad men who have been discharged from other departments coming to seek employment here. It is often impossible to find out the antecedents of men who seek employment, and it is sometimes necessary to entertain men to fill up vacancies, about whom nothing is known, and frequently it is only after they have worked for some time, that it is found they are bad and unsuited for employment. The difficulty is very great in this Circle, as nearly all the men seeking employment come from other districts—Gya, Behar, Bankura, &c. I need not point out, if this be true, how injurious it is to discipline, and how useless it is to inflict punishment on or discharge vaccinators."

Legal opinion on question as to whether Fee payable under Vaccination Act for Home vaccinations can be reduced.

246. The Civil Surgeon of Midnapore having enquired whether the fee payable for home vaccination in the rules framed under Section 33 of the Bengal Vaccination Act, could be reduced by Municipalities, if they consider it advisable to do so, the question was referred to the Superintendent and Remembrancer of Legal Affairs, and that Officer furnished the following opinion:—"Section 8 of the Act says that when a public vaccinator attends elsewhere than at a public vaccine station *for the purpose of vaccinating a child*, he should be paid a fee not exceeding *eight* annas,

such fee to be appropriated as the Lieutenant-Governor may direct. The rule referred to says that persons applying for home vaccination shall pay a fee of *four* annas *for each vaccination* (which would seem to mean each person vaccinated). Both the Act and the rule are loosely worded. Under the former the fee would seem to be payable for the *visit*, and then only when a *child* is vaccinated; while the rule requires a separate fee from *each person vaccinated.* I see no objection, however, to the Municipal Commissioners themselves paying a portion of the fees if they choose, or to their remitting a portion of the fee if (as I believe is the case) the fees are made over to them by the Lieutenant-Governor."

Training of men in Vaccination.

247. In the *Darjiling* Circle the licensed vaccinators entertain apprentices, but they are not allowed to practise independently, until they evince a competent knowledge of vaccination both in theory and practice. In the *Eastern Bengal* Circle 14 men were trained in vaccination. The Superintendent says that the great drawback with regard to these men is that they are generally illiterate and unable to write; but that they take kindly to the work and practise it with fidelity. The Superintendent should, however, have trained more men for the new areas to be placed under Licensed agency. In the *Behar* Circle 12 inoculators were trained during the year. *Orissa Circle.*—The Superintendent suggests that, should the licensed system be introduced in his Circle at the ensuing working season, 20 inoculators be trained in vaccination during the recess, or at the commencement of the next cold season on a subsistence allowance of Rs. 4 each per mensem.

The local reports do not show that more men were trained anywhere in this work. This subject must be attended to more carefully, as the Licensed System of vaccination is being extended year after year, and the need for trained Vaccinators is consequently greater.

Attitude of the people towards Vaccination. Opposition offered. Local aid rendered.

248. There is evidence in the reports of the Officers of the Vaccination Department that vaccination is appreciated in many places, and that the ignorant prejudices, mistrust, and opposition of former years are gradually giving way to a healthier view of vaccination. I will therefore indicate under this head where such conditions, which militate against the measure, still exist, what aid was rendered in promoting vaccination, and the nature of the opposition which was offered to it.

In *Calcutta* the steady increase of home and station vaccinations clearly indicate that vaccination is readily accepted. The station vaccinations amounted to 58·48 per cent. of the total operations of the year, the home vaccinations to 18·21 per cent., and the bustee operations to 23·30 per cent. The corresponding proportions of the preceding year were 57·18, 15·97, and 26·85 per cent. respectively. The up-country people of all classes still offer resistance. The lower classes among them reluctantly submit to the measure through fear of prosecution, but the opposition of the upper class is still very great, and they adopt various stratagems to evade the law. Consequently the progress of vaccination among them is very slow. The police rendered cordial assistance in all matters connected with vaccination.

Suburbs of Calcutta.—Here also the up-countrymen who have settled for business, or who work as day-labourers, are opposed to vaccination, and will not accept it until notices under the law are served on them. Upon the admission of several cases of small-pox in the Campbell Hospital, it was deemed expedient to vaccinate all the work-people who were employed in repairing that building; but on vaccinators being sent for that purpose, the labourers absconded.

In the *Metropolitan Circles* the Ferazees in the 24-Pergunnahs, Khulna, Jessore, Nuddea, Murshidabad and Birbhum districts, a few Hindu families known as '*Echar Ghar*,' and the Hindu population generally in the Midnapore district, strenuously resist vaccination, the Ferazees most obstinately. Dr. Ghose doubts whether the Ferazees will ever be protected without strict legal intervention, which should reach their zenanas. In the Chunderkona town only one Ferazee out of 100 in it accepted vaccination, and the "Sharacktanti" as a class

have never received vaccination. In thannah Ranaghat the Mahomedans bolted their gates on the approach of the vaccinators, although small-pox was present among them. In the Birbhum town the chief objection is to have children under one year vaccinated. In the Midnapore district lymph from the arms of children is not allowed, the prejudices of the people being so great in the matter that violence is sometimes resorted to when vaccinators attempt to take the lymph. With regard to aid rendered in promoting vaccination, Dr. Ghose brings to notice the following Sub-divisional Officers as having distinguished themselves in this direction. Baboo Umesh Chunder Battabyal of Tumlook, Moulvie Bazlul Karim of Ghattal, Kumar Gopendro Krishna of Baraset, Babu Troyluckho Nath Sen of Bongong, Babu Ram Churn Bhuttacharjee of Ranaghat, and Babu Narendra Nath Roy Chowdhry of Bagirhat. Babu Kartick Chunder Sircar, the Sub-Inspector of the Bhagwanpur thannah, rendered every possible assistance for the progress of vaccination in his thannah. He was the only Police Officer in the whole district of Midnapore who took real interest and trouble in the work. The Sub-Inspector of thannah Egra was indifferent with regard to the help expected from him in the work of vaccination. He evaded furnishing the Deputy Superintendent with the village population list, although a readymade one was in his station. In Howrah a village punchait, named Ramdan Shaikh, not only refused to have his household vaccinated, but also dissuaded the Mahomedans in his neighbourhood from accepting it. Dr. Ghose recommended that such a person should not be allowed to hold a position of importance in the village. The matter was referred to the Magistrate. The Government tehsildar, Bhagabut Chunder Das, in village Nilkantpur, in thannah Contai, was reported to be the ringleader in the resistance to vaccination which was offered in that village. With regard to Police and Civil assistance in general, Dr. Ghose says:—"The question of help given by the Police or other Civil authorities depends on the idiosyncracies of individual officers. Some readily give help, others are very averse to interfere with the prejudices of the people. But where assistance was given much good work was done." It is gratifying to find that the Marwaries in the Burdwan town, who had long held out against vaccination, have submitted to the measure, and have now been well protected.

Dr. Ghose, finding it difficult to enforce vaccination in certain unprotected rural areas, suggested the advisability of arming the village Unions, to be formed under the Local Self-Government law, with power to compel people to accept vaccination when the Superintendents of Vaccination desire them to do so. The question was submitted to Government.

Darjiling Circle.—In this Circle also the Ferazees of Rajshahye and Maldah and the Hindus in Dinajpur and Sherpur offer much resistance, and the people in the Dinajpur district decline vaccination from dislike to their children being carried from village to village as vaccinifers, although the chowkidars are willing to accompany them. In the Julpaiguri district the objection is to have children vaccinated in certain months and during festivals, and especially when the females are in the family way, but the Magistrate says that there is less objection to vaccination in this than in almost every other district he has served in. Managers of Tea gardens all over the Circle rendered aid and encouraged their coolies to be vaccinated, and Dr. Wood has "to thank the gentlemen of the Terai and Duars for their kind assistance." The only exception was the manager of the Garidara Tea Estate, who refused to have the coolies vaccinated in December, which is a busy month. It appears that in some places chowkidars and police constables accompany the vaccinators and render assistance. The Magistrate of Rungpore believes that the presence of a Police Officer makes vaccination unpopular.

Ranchi Circle.—In this Circle the Brahmins, Rajpoots, Bunyas and higher castes, the Marwaries and the up-countrymen, especially the Bunyas, do their best to avoid vaccination and give trouble, and the lower classes take their cue from them. In the Lohardugga district the people generally accept vaccination only through fear of being punished. The aborigines in the Circle take the prophylactic readily and willingly, excepting the Koles in

Singbhum and in thannah Balumath in Lohardugga, who objected strongly, and gave much trouble, as they feared that some evil result would follow the measure. In some places in Hazaribagh great difficulty is experienced in carrying out arm-to-arm vaccination, as the people believe that the child will be hurt, or suffer otherwise if the lymph is taken. The people of Manbhum and Singbhum consider vaccination "as a religious rite. They do not shave their beards, do not send their clothes to the washerman, do not take fish or flesh, and do not use turmeric in their curry, &c." In several cases, however, men and women voluntarily had themselves or their children vaccinated, indicating that the people here are beginning to appreciate the benefits of vaccination. The Pachete Rajah, who had strenuously opposed vaccination for a long time, this year allowed, after much persuasion and explanation regarding the benefits of the prophylactic by the Deputy Superintendent, his grandson and two granddaughters to be vaccinated, and his example was followed by the leading men of the place, who had also to be collected and addressed on the subject. After this vaccination was carried on without much difficulty in the Rajah's territory. Valuable assistance was received from the Civil authorities generally, particularly from the Assistant Commissioner of Palamow, Mr. Rennie, who used every endeavour to forward vaccination, in most cases successfully. The Police also rendered appreciable aid, especially Tanki Proshad, Inspector of Mankah; Bankar Ali, Head-constable of Panki; Ram Jatan Singh, Head-constable of Labiahar; Mufti Hossein, Sub-Inspector of Hosseinabad; Ishri Sahai, the Sub-Inspector of Silli; Gridhari Lall, the Sub-Inspector of Burway, and Guru Sharu Singh, the Ilakadar of Sonahatu. The Municipal Commissioners of Purulia evinced great interest in the work; but the Municipal Commissioners of Ranchi, are said to have maintained an attitude of passive indifference to vaccination. The Superintendent takes the opportunity of recommending to favourable notice the great assistance to vaccination, and generally, given by Babu Bajrang Sahi. This Babu was formerly clerk in Dr. Owen's office, but on his taking up a better appointment as Court Nazir he still exhibited great interest in vaccination. His thorough knowledge of the conditions of this large Circle, of its previous history, of a large number of men who seek employment, and his perfect willingness to furnish full information and assistance in every way, have been of very great service to Dr. Owen, who adds that, the difficulties of carrying on the work in this large area, which are extreme, would have been unsurmountable were it not for the aid rendered by this Babu. Of opponents to vaccination, zemindar Chumru Sahie was very obstructive, and prevented vaccination being carried on in Silli, a large and important village on the Ranchi and Purulia high road, and in 12 of his other villages. The zemindar of Baranda, the Illakadar of Thakoorgaon, the Thakoor of Jorai, Kali Das Bakshi Illakadar of Gola, a very large place, the Ilakadar of Okri, Gopal Thakoor of Marapari, Sukaram Patwar and Chandri Patwar and Dev Charan Thakoor of Joggessur, and Hari Mati thikadar of Jhurpo, also opposed vaccination and prevented its being carried on in their villages. Hit Narain Lall of Balumut would not permit the vaccinated children to be inspected.

Sonthal Pergunnahs Circle.—In Bhagulpore the people generally, and the Rajpoots and Mughia Brahmins especially, resist and distrust vaccination. The same is the case in Monghyr, but in a greater degree, the Rajpoots, zemindar Brahmins and higher classes of the Mahomedans often assuming a hostile attitude. The lower classes of Hindus and those who come under the head of "Other races" in these districts, however, appreciate the measure, and the Superintendent has to a great extent succeeded in breaking down the resistance offered by the above-mentioned higher classes. The Sonthals in the Sonthal Pergunnahs district are docile and voluntarily have their children vaccinated, but the Hindus of Goldar Kaista among them, resist obstinately. The Marwaries in the Colgong and Rajmehal towns, and the same class and the Brahmins in the Monghyr town are bitterly opposed to vaccination, even preferring in the last-named town to pay large fines levied on them, a notable instance of which will be found narrated in a subsequent portion of this Report. The people in the Bhagulpore town, especially the lower class, have no faith in vaccination, as it does not bring out an eruption as in inoculation, without which they consider protection inefficacious. The Magistrate

of Bhagulpore, the Sub-divisional Officers of Banka, Jamoee, Pakour, Rajmehal and Deoghur, and the Police in Rajmehal and Pakour rendered every assistance in promoting vaccination.

Eastern Bengal Circle.—The Forazees who inhabit every district in this Circle, and the educated and well-to.do higher castes of Hindus and a section of the Hindus known as "Haribolas" are most obdurate in resisting vaccination. The Ferazees reject both vaccination and inoculation on religious grounds, but the Hindus of the above-mentioned classes prefer inoculation, considering it more efficacious than vaccination. The Superintendent is of opinion that nothing short of the Compulsory Vaccination Act will break down the opposition of these classes, many of whom resist simply because they know that vaccination is optional. All others, comprising the great mass of the population, either appreciate vaccination, or follow the lead of the "Prodhan" or proprietor of the village in accepting it. A smart outbreak of small-pox in the town of Dacca, after a long period of immunity from the disease, roused the people from their usual obstinate resistance to vaccination. The fanatical Mahomedans in this town hold that their Koran forbids vaccination. In the town of Faridpur vaccinating with tube lymph is objected to, otherwise they are favourably disposed. In the Backergunge town the people were lectured on the subject of vaccination, but they were still obstructive. The law rendering vaccination compulsory is indicated. This enactment is also required for the Muktagachee town, which "may be said to teem with natives of rank and wealth," who are apathetic and indifferent in the extreme towards vaccination. In the Perozepore town the resistance was so persistent that only two persons could be vaccinated. The same cause resulted in only nine being vaccinated in the Bauphal town. In the Pubna town the Muchi class reject vaccination on religious grounds. Mr. Cooke, the Magistrate of Tipperah, Mr. Barooah, the Magistrate of Noakholi, and Mr. Todd-Naylor, the Sub-divisional Officer of Naraingunge, rendered great assistance in promoting vaccination. The last-named officer endeavoured much, but ineffectually, to overcome the prejudices of the Ferazees in char Baktaboli. Babu Pran Nath Basu, the Sub-Inspector of Daudkandi, also gave much help. Of the Municipal Commissioners of the Pubna town, Babus Grish Chandra Roy and Kally Mohun Bose rendered great assistance; but in the Chittagong town, at a meeting of so enlightened a body as the Municipal Commissioners, it was not difficult to see that they were very apathetic about enforced vaccination, and thought inoculation good enough.

Orissa Circle.—In this Circle the greatest opposition is offered by the high castes, such as Brahmins, Mahanties, and Priests, on the ground that no eruptions appear on the body after vaccination, as is observed in cases of inoculation. The low caste people, Mahomedans and Native Christians, readily and willingly accept it. In the Cuttack town, in addition to the high castes, the Bhoojpoories and Marwaries stand in the way of vaccination. In the Puri town the feeling against vaccination is strong, and, as usual, there is great dislike manifested in parting with lymph from the arm. They believe, the Civil Surgeon says, "that a tie is established between the donor and the recipient, and that the ills of life of the latter may also befal the former." In the Balasore town no definite mode or plan of operations can be carried on, as the people have literally to be coaxed for their consent in the matter. In fact all the details, as to day, time and extent of operation, the spot where virus is to be introduced, are settled by the villagers, and the Civil Surgeon says "we simply act the humble part of introducing the virus." The adoption of the Compulsory Vaccination Act is strongly indicated. The Police, Rajahs and Zemindars are reported to have afforded every assistance in carrying out vaccination.

Behar Circle.—In this Circle the people generally are not well disposed towards vaccination, as they distrust its protective power on the ground that no eruptions are caused by it as by inoculation, and because they are strongly impressed with the idea that the imposition of a fresh tax will follow its introduction. The higher classes, such as the Brahmins and Rajputs, are highly refractory, and the poorer classes dislike having their children operated on by the Licensed vaccinators. In Shahabad the people assaulted two of the vaccinators, and it is only the Mahomedans who appreciate the measure, very few opposing it. In the towns of Behar, Gya, Durbhanga and Tajpur

dislike to vaccination exists among the higher classes and the well-to-do. In the Patna town the orthodox of both Hindus and Mahomedans are still reluctant, particularly the Marwaris, who consider it "a special blessing if their children get small-pox spontaneously." In the Mozufferpore town vaccination is regarded with indifference or active hostility. The latter attitude is displayed most by the higher classes of the Hindus, especially the Brahmins and Rajputs. The Mahomedans seem to object to vaccination on the ground "of its novelty." The people in the Allapur pergunnah in Naraya, in Durbhanga, dislike re-vaccination. In the Dumraon town the fact of the Maharaja having allowed his family to be vaccinated had a favourable influence on the higher classes of Hindus. Of all the towns in this Circle, in only Barrh the people entertain a favourable opinion of vaccination, and many parents here asked voluntarily to have their children vaccinated. The Cantonment Magistrate of Dinapore and the Sub-divisional Officer of Buxar rendered much assistance in promoting vaccination, the latter Officer doing his best to remove opposition to the measure in thanahs Dumraon and Buxar. The Police were indifferent to the matter everywhere, except in thanah Belauti, and the Zemindars and Punchayets evinced similar indifference, and some of them opposed the measure, notwithstanding the receipt of the Magistrate's purwannahs. In Bhabuah town, in Shahabad, the Municipal Commissioners aided the work of vaccination. The Magistrate of this district says that the vaccinators in the district received every assistance from the officials and zemindars, and such success as attended their efforts would have been wanting but for this. This is opposed, so far as the zemindars are concerned, to the Superintendent's statement, and also to the following opinion furnished by the Civil Surgeon of Sarun, Dr. Russell, who says, in explanation of not seeking local aid for promoting vaccination, that "long experience has shown that such measures, as far as this district is concerned, are practically useless. All that the Civil authorities can do is to furnish purwannahs which are of no real value, and if the Police are appealed to in order to render assistance, the procedure takes the form of compulsory vaccination. Influential natives are quite apathetic and indifferent as to the success of the measure."

Extension of the Compulsory Vaccination Act.

249. During the year under review the Compulsory Vaccination Act V (B.C.) of 1880 was brought into operation in the towns and thanas named below. The law is now in force in 81 towns, 4 cantonments, and 9 rural areas; and preliminary steps have been taken to extend it to the Chittagong and Sudharam Municipalities.

TOWNS.	THANAS.
Kotechandpur in Jessore.	Brahmanberia, Nobinagur, Moradnagur, Kotwali, Chandina } In Tipperah.
Deoghur, Sahibgunge, Dumka, Rajmehal } In Sonthal Pergunnahs.	
Brahmanbaria, Comillah } In Tipperah.	
Darjiling.	
Cuttack	
Balli in Howrah.	
Sherpore in Bogra.	
Patna.	
Durbhanga.	
Hazaribagh.	
Purneah.	
Puri.	

Mozufferpore.—Dr. Mathew, the Civil Surgeon, has corresponded with the Chairman of the Municipality of *Mozufferpore* regarding making vaccination compulsory in that town; but he says that "circumstanced as we are here,

this is a matter not to be lightly undertaken, and will no doubt be actively opposed by the leading members of the Behari community, whose prejudices are, if anything, more difficult to overcome than those of the humbler and more ignorant classes of the population." The Magistrate also fears that the Municipal Commissioners will refuse to accept the measure, as the Hajipore Municipal Committee have done. *Dinajpur* Municipality.—The Civil Surgeon strongly advocates the introduction of the Act, in order that vaccination may be systematically carried on and the town thoroughly protected. This he thinks the more necessary as the new Railway may bring in cases of small-pox which may spread the contagion. But the Municipal Commissioners are against the measure, and the Magistrate says that "when the place is so free from small-pox that only one case of mild type occurred in the year (and none during the preceding four years) there does not seem to be any very urgent necessity for the introduction of compulsory vaccination against the wishes of the representatives of the community. Vaccination if accepted voluntarily is preferable to compulsory vaccination;" and he finds no difficulty in inducing the people to allow their children to be vaccinated. *Mymensing*—The Civil Surgeon thinks that the Mymensing and the other Municipalities in this district are ripe for the introduction of the Act, and that it could be enforced with ease and without resistance.

Law how worked in the Towns in which it is in force.

250. The administrative details connected with the introduction of the Act during the year into the places mentioned above need not be recapitulated here, as they were, *mutatis mutandis*, the same as mentioned in former Reports. The following observations relate, therefore, only to the attitude exhibited by the people towards the measure, the steps which were adopted to enforce its provisions, the results, and to other cognate matters.

In *Calcutta* the law was more vigorously enforced than before and worked throughout the year, additional establishment being engaged for tracing out the unprotected children by making house-to-house enquiry. It was found that the parents or guardians of 5,716 children had failed to produce the statutory certificate of having had them vaccinated. These cases were enquired into, with the result that 3,717 of these children were subsequently vaccinated; 384 were found to be ill, and vaccinations were postponed in their cases; 739 were found to have left town; 252 had died; 415 could not be traced; 22 had natural small pox; and 187 were prosecuted and vaccinated by order of the Magistrate. There were besides 221 prosecutions of persons who had disregarded the notices served on them, or had omitted to bring their children back to the station for inspection after vaccination. The law is said to have worked very successfully among the lower classes particularly of the floating population, but, as above shown, many evade its requirements. Very few of them have the births of their children registered, and those who do so do not get the children vaccinated, and when the evasion is detected, say that they have sent the children to their native country. In many cases incorrect addresses are given, either intentionally or accidentally, so that these cases cannot be traced afterwards. It is extremely difficult to obtain information of unprotected persons, and children in Burrabazar, Jorasanko, and the other quarters frequented by up-country people, and as a consequence small-pox prevailed to a large extent in these wards. Reviewing the work of the year, Dr. O'Brien writes:—"There can be no question that the results of the working of the Act during the year under review was highly satisfactory. If vaccination is pressed on with the same vigour in succeeding years, the state of protection of the town will improve materially. Nevertheless, it would be chimerical to expect that the town will be ever free from attacks of small-pox as long as its population is a fluctuating one, largely reinforced every year from districts where vaccination exists but in name, and as long as the town is open to the direct importation of the disease by rail and boat from districts where inoculation is still openly practised." *Suburbs of Calcutta*—From Dr. Ghose's report it appears that the whole establishment of the suburban municipality from the Deputy Superintendent downwards were ignorant of the

provisions and requirements of the Compulsory Vaccination Act; that the vaccination depôts were seldom opened, the bulk of the operations being carried on by house-to-house visitations; and that notices under the Act were seldom served and prosecutions for evasions never instituted. Thus the law was a dead letter. Dr. Ghose had therefore to commence the work *de novo*. He first weeded out the obstructive element in the establishment, and then taught the establishment their duty in connection with the law, and throughout the season watched the operation of its provisions. The result was complete success. The work of inspection has become simple; accuracy of figures has been secured; the poor people had the advantage of free vaccination by being saved from the illegal exactions of the vaccinators; and extraneous help in the shape of assistance from the Police, except in the matter of serving notices and summons in which they gave all the assistance which was required, was not much needed. The law is said to have worked successfully in all the five Municipalities in the Burdwan district, viz. *Burdwan*, *Ranigunge*, *Khulna*, *Dainhat* and *Cutwa*, the institution of prosecutions not having been found to be necessary anywhere. In *Burdwan*, owing to the presence of small-pox, operations had to be carried on throughout the year, and it is satisfactory to find that the Marwaris, who were at the outset strongly opposed to the measure, have at last acquiesced and allowed their children to be vaccinated. No reports were received with regard to the manner in which the law was utilized in the towns of *Bankura* and *Bishenpore* in the Bankura district. The report from *Soori* in Birbhum shows that 30 persons who refused to have their children vaccinated were prosecuted, but when they appeared before the Magistrate they agreed to submit to the measure, and did so. There were 22 house vaccinations on payment of the prescribed fee. The registration of births is advocated to enable the law being duly and more efficiently enforced. The law is in force in the six Municipalities—*Midnapore*, *Ghattal*, *Chundrakona*, *Khirpai*, *Ramjibunpore* and *Tumlook*—in the Midnapore district. In *Midnapore* the Civil Surgeon, Dr. Tomes, took great and commendable interest in working out the provisions of the law, resulting in the disappearance, to a great extent, of the resistance, apathy, and indifference hitherto exhibited, and to the attendance at the stations being at last recognized and adopted. The milder measures adopted in the preceding year being found insufficient to induce the people to conform to the requirements of the law, prosecutions of evaders were therefore instituted this year and 90 persons were thus brought up, most of whom were convicted and fined. The result was most marked. The stations were thronged, and the Act works smoothly now. The low classes, however, require to be still looked after, as they are so indifferent and apathetic by nature as to require a stimulus in the shape of a prosecution from time to time. Two hundred and seventy-four home operations were performed, which realized in fees Rs. 68-8. In *Ghattal* the law is said to have greatly lessened, without the institution of prosecutions, the opposition to vaccination hitherto exhibited A hostile attitude is no longer assumed, but some disinclination is manifested in permitting *virus* to be taken from the arms of children. Eighty-nine home vaccinations were performed, which realized Rs. 22-4. The report from *Tumlook* only says that the law was worked in the usual manner and its provisions enforced in cases of necessity. In the three remaining towns, *Chundrakona*, *Khirpai* and *Ramjibunpore*, the provisions of the law do not appear to be utilized, the main reason being that there is only one vaccinator who has been appointed to attend to all the three towns, who, moreover, is deficient in tact and industry. The law was in operation in the seven Municipalities of *Hughli*, *Serampore*, *Bansberia*, *Utterpara*, *Kotrung*, *Boidabatti* and *Bhudressur* in the Hughli district. In *Hughli* the enactment is said to have worked satisfactorily under the usual arrangements. In *Serampore* the Civil Surgeon, Dr. Barker, who is in charge of the working of the Act, paid close attention to the subject. In company with the Registrar of Births, who took his register with him, he went through the town ascertaining in which families children were born during the preceding year. In this way he discovered that children between 3 and 6 months of age of over 100 families had not been vaccinated. He then caused

notices to be served on the parents or guardians of these children, and had those who were in a healthy state vaccinated. In *Utterpara* the people willingly resort to the vaccine stations. A few notices had to be served, but all the recusants, excepting two, submitted to the measure. These two were prosecuted, but the Magistrate acquitted them on the ground that, being above 14 years of age, they could not be punished, *vide* Section 3 of the Act. There were 39 home vaccinations, which realised Rs. 9-13 The Vice-Chairman of the *Boidabatti* Municipality says that, "since July 1883, the time of the introduction of the Compulsory Vaccination Act V of 1880, the health of the town has much improved." There is one vaccine station, and although it is open for two days in the week, the vaccinator has to go to the houses of the respectable persons. There was no opposition. In the *Howrah* town the working of the law is under the supervision of the Deputy Superintendent of the Suburbs of Calcutta with a staff of 3 vaccinators. The people are said to have been reconciled to the measure, but the outturn of work was not satisfactory, and this is ascribed to Balli having been separated from it and to the transfer of the Inspecting Officer on promotion during the working season. The operations were carried on with humanized lymph, as proposals made for the introduction of bovine lymph were rejected by the Municipality under the advice of the Civil Surgeon. On *Balli* being constituted a separate Municipality from that of Howrah, it made its own arrangements for carrying on vaccine operations. Sanction was obtained for the introduction of the law, which came into operation on the 1st of October of this year, and two vaccine stations were established, one at Balli and the other at Belloor, to both of which a vaccinator was appointed; but the latter station was not opened until the end of the working season. There was a falling off in the number of operations, due to the vaccinator having been retained only during the working season instead of throughout the year, as was the case when Balli formed a part of the Howrah Municipality. The law is in operation in 15 Municipalities in the 24-Pergunnahs district, excluding the Suburban, which has been separately reported on. In the *North Suburban* or *Baranagore* Municipality the up-country people, a large number of whom are attached to the mills, opposed the operation of the law, and after steps had been taken to enforce its operations, the opposition was overcome, but with great difficulty. As the area of the *South Suburban* Town is very large, no vaccine depôt arrangements could be made, and consequently the two vaccinators employed by the Municipality went from village to village vaccinating children as they came across them. The work was under the immediate supervision of the Deputy Superintendent of the 3rd Metropolitan Circles and the Inspecting Vaccinator of the Alipore Division. In the *North* and *South Dum-Dum*, *Joynuggur* and *Barripore* Towns the provisions of the law were not strictly enforced. In *Takee* no operations were performed; and in the rest (7) of the Municipalities the law was not worked at all, owing mainly, it is said, to the areas being large, requiring several vaccine stations to be opened and more than one vaccinator to be employed at each. Moreover, the operations in these Municipalities were limited to two or three months only. The Municipal Commissioners of all these municipalities should make better provision for carrying on vaccination and should fully utilize and enforce the provisions of the law. There are 8 Municipalities in the Nuddea district into which the law has been introduced. In *Kishnaghur* the law was worked with much attention, and it is noteworthy that four of the vaccine stations are located at the houses of native Municipal Commissioners, who are persons of position and popularity, and who take much interest in promoting vaccination. There was no opposition, except in one case only, on whom notice had to be served, and who on its receipt submitted to the measure. The Magistrate observes that as the number vaccinated was 525 and the births 549, there is very reason to suppose that the Compulsory Vaccination Act is efficiently administered and observed; but he should have remembered that as the registration of births is incomplete, the unreported births have not been affected by the measure. In the *Ranaghat* Municipality the provisions of the law were not sufficiently or strictly enforced, and no vaccinator was appointed up to the 10th of November. The

Magistrate was communicated with on this point. In the *Nuddea* Municipality no operations were performed. No reports have been received with regard to the other five Municipalities. Similarly no reports have been received with regard to the manner in which the law was worked in the three Towns of *Satkhira*, *Chanduria* and *Debhatta* in the Khulna district, except that at all three Municipalities vaccinators carry out the operations and that at *Satkhira* no vaccine station has been opened. The probability is that no steps have been taken in these Municipalities to carry out vaccinations under the provisions of the Act. The Act was in operation in the *Jessore* and *Mohespore* Towns in the Jessore district. No report has, however, been received regarding the last named town, and with regard to the other, it is said that no necessity had arisen for the enforcement of the provisions of the law. The Civil Surgeon of Jessore suggests that in order to comply with the requirements of the Compulsory Vaccination Act, births should be registered in the Town by the Municipality and not by the Police, in order that the notices may be served as required at the time of registration. In the *Kotechandpur* Municipality the Act was introduced on the 1st of February 1884, but no report has been received as to how it is being worked. In the four Municipalities in the Murshidabad district—*Berhampore*, *City Murshidabad*, *Kandi* and *Jungipore*—the people do not object to the measure, but the Civil Surgeon says that much remains to be done before it can be said to be everywhere in real working order, particularly in the two last named towns. In *Berhampore* it has had a good effect, for the people, knowing that they have to undergo the penalty prescribed by it for evasion, readily bring their children to be vaccinated. In *City Murshidabad*, with the exception of a few old bigotted Mahomedans and shopkeepers who are prejudiced and apathetic, the rest of the people, besides presenting no resistance, exhibited signs of increasing appreciation of the measure, as a number of them had themselves and their children re-vaccinated. Home vaccinations were also carried on, which realised Rs. 18. On the whole much attention appears to have been bestowed on the subject in this town, which resulted in an improvement. Dr. Ghose, the Officiating Superintendent of Vaccination, Metropolitan Circles, has proposed the employment of a permanent vaccinator throughout the year for this town, in order that *virus* may be kept up and any outbreak of small-pox which may occur may be attended to. The Magistrate considers this to be absolutely necessary. In *Jungipore* the law does not appear to have been systematically worked. Rs. 3 were realized for home vaccination. It was reported that in *Kandi* there is no necessity to enforce the provisions of the law, as the people readily accept vaccination. Nevertheless, a depôt should have been opened and fees realized for home vaccinations, which were performed free of charge. In *Beauleah* town in Rajshahye the law is said to be favourably received and to have worked remarkably well, but the late outbreak of small-pox does not indicate that this statement is correct. In the *Rungpore* town the vaccinators have to vaccinate the people, high and low, in their houses without payment of the prescribed fee. The Magistrate says that "until vaccination becomes popular it must be performed free of charge. One can hardly expect even the tame and humble Rungporian to pay for an operation which he objects to and disbelieves in." *Bograh* and *Sherpore* Municipalities in the Bograh district: Nothing special has been reported with regard to the working of the law in the former Town, and in the latter in which it was introduced late this year—on the 1st of October—the people at first opposed the measure, but on notices being served on some of them, their opposition ceased, and the law is now working with "improved results." In the *Pubna* Town the Act, although introduced in 1882, was not systematically worked until the year under review. The people, particularly the Mahomedan women, strongly objected to attend the two vaccine stations which were opened, and insisted on home vaccination. It was deemed advisable to relax the rule at the onset, and the vaccinators were allowed to operate on the people at their houses. Sixty notices had to be served, and prosecutions were instituted when persuasive and other means failed. The lower classes still evince reluctance. For these reasons, as well as on account of the prevalence of fever, progress has been slow; but it is believed that the people will be gradually reconciled to the

measure. In the *Darjiling* Municipality the Act was introduced this year. The usual procedure was adopted, viz., establishment of vaccine stations, notifying to the people that the law was in force, &c. Although the vaccinator regularly attended the stations, a large portion of his work was done by the usual house-to-house visitations. No reports as to the manner in which the law was worked in the *Comillah* and *Brahmanberia* Municipalities in the Tipperah district, into which it was brought into operation on the 31st of March 1884, have been received, except that there was no opposition exhibited by the people. In the *Patna* Municipality the law was introduced this year in October. The usual steps were taken for bringing it into operation, and an Inspector appointed to supervise its operation. The measure being new, the people did not understand it, but they are at the same time extremely apathetic and do not trouble themselves about vaccination, except when it is forced upon them. House-to-house operations were also carried on, it appears, without the prescribed fee being charged, as the upper classes are reluctant to send their children to the depôts. It is expected that during the next season there will be an improvement in the attendance at the depôts when the people will have been impressed with the benefits of vaccination. In the *Gya* Town generally, the Mahomedans appreciate the measure more than the Hindus, but the higher classes and well-to-do of both communities and the Priests still resist the operation of the law by every means in their power. Five hundred and sixty-five notices had to be served, and 130 of these cases had to be handed up to the Magistrate before the recusants would comply with the requirements of the law. There were besides 81 prosecutions for evasions, resulting in 31 persons being fined and the rest having their children vaccinated before the Magistrate. Home vaccinations were carried on, which realized Rs. 48-4. On the whole, however, the work is said to be progressing well. In the *Durbhanga* Municipality the law was introduced this year, and the usual steps taken to give effect to it. No opposition was offered, and it was observed that the reluctance exhibited in former years had given way under the operation of the law, and the system is reported to be working well. In the *Monghyr* Municipality the major portion of the rich kept aloof. They are either active opponents or simply apathetic. The Police were also less zealous in reporting recusants. It was noticed that parents sent away their children till the vaccination season closed, when they were brought back to be a danger and centre of infection the moment an epidemic of small-pox breaks out. This cannot, it is said, be checked till birth registration is more efficiently carried out. The Honorary Magistrates, it is reported, added largely to the difficulties which had to be contended against. Cases for refusal to comply with the law sent up to them were either postponed time after time, or the accused were fined an anna or two. The Magistrate says that notice has been taken of this. Moreover, the idea gained currency that punishments for refusal could not be inflicted in consequence of the child being under one year. The poorer classes do not offer active opposition ; but of the rich people above alluded to, the Bunneahs and Marwaris are still bitterly opposed to vaccination, resist its introduction into their families by every means in their power, even preferring to pay large fines levied on them. "In this way one of the richest of the community has successfully evaded complying with the Act, the delays attending a legal process having seen him pass through an entire season without his children being vaccinated." His example has encouraged others, as he makes no secret of his intention to continue the operation. The Magistrate states that the Bunneah in question is one Sental Pershad, who has been fined twice, once Rs. 50 and another time Rs. 100, for not vaccinating his children, but is still recusant. He and others have sent up a memorial to Government praying that they may be exempted from the operation of the law. A report on this memorial was called for and submitted, and the opposition will no doubt vanish when they find that they cannot be exempted. In the *Jamalpore* Municipality in the Monghyr district there were 24 prosecutions, in which 10 of the accused were fined, and the rest let off as they vaccinated their children after service of summons. Home vaccinations were carried on, which realized Rs. 21-12-0. All the Railway employés have been vaccinated within the last two years, as under an

order of the Agent they are bound to be vaccinated under penalty of dismissal or heavy fine. The Act was introduced into the *Bhagulpore* Municipality on the 15th of February 1884. At first the vaccinators were posted at the stations, but as the people did not bring their children to them, it was decided that they should proceed from ward to ward, the Municipal Commissioners of the several wards undertaking to collect the people of their respective wards in their own houses and to render every assistance in their power. In the *Colgong* Town in the Bhagulpore district the Marwaris and Brahmins refused to allow their children to be vaccinated, but on being prosecuted they accepted the measure. In the *Purneah* town the provisions of the law are well received, and it has not been found necessary to prosecute any person. In the *English Bazar* Town, in the district of Maldah, the law is said to have worked as in the preceding year. Notices had, however, to be served on those who refused to have their children vaccinated, and two of the accused were prosecuted. It is said that on the whole the measure is approved. The Act was introduced into the four Towns in the Sonthal Pergunnahs district—*Sahebgunge*, *Rajmehal*, *Dumka* and *Deoghur*—on the 1st of October. In *Sahebgunge* the measure was not favourably looked on by the people, particularly by the Marwaris, who obstinately opposed it, but on the law having been brought to bear upon them they yielded. Similarly there was some opposition in *Rajmehal* Town, which was subdued by the enforcement of the law. No reports have been received regarding the operation of law in *Dumka* and *Deoghur*. In the *Cuttack* Municipality and *Cuttack Cantonment* the Act was introduced on the 1st of September, and the necessary steps taken to give effect to its provisions. The Superintendent of the Orissa Circle says that the law is working satisfactorily in both Town and Cantonment. *Puri Town.*—This Town was divided into two sections, and a vaccinator worked in each and one in the neighbourhood of the Town. Each of them was furnished with a certificate stating that he was authorized to vaccinate, but the people being very averse to vaccination, the progress was very slow. In the *Hazaribagh* town the Act was brought into operation on the 1st of January 1885. The practice here is for the vaccinator to apply twice for permission to operate, and if vaccination is refused, he takes down the names of the parties who decline to comply, for prosecution. This procedure, the Civil Surgeon, Dr. Meadows, says, removes all objections and prejudice, as here the "people understand direct orders and believe in their efficacy when they see that the authorities are in earnest."

Operation of the Compulsory Vaccination Law in the Rural Circles.

251. In the district of *Bhaugulpore* the Act was in force in the *Rural Circles* of *Bhaugulpore*, *Sultangunge*, *Colgong* and *Bihipore* from the 15th February 1884. The administrative details connected with its introduction have been mentioned in the report for 1883-84. The Superintendent of Vaccination, Sonthal Pergunnahs Circle, mentions in his report that the people were generally against the measure, and great resistance was met with, particularly from the Rajpoots and zemindar Brahmins; that several cases of evasions of the law had to be reported; and that some of the persons implicated in these cases were vaccinated before the Magistrate and others subsequently, while several were punished. A more comprehensive report should have been furnished of so important a subject. *Tipperah.*—In this district the law was introduced into the *Rural Areas* of *Brahmanberia*, *Nobinagore*, *Mooradnagore*, *Kotwali* and *Barkampta* on the 31st of March 1884. No particulars have been furnished referring to the *modus operandi* connected with its introduction. The Magistrate reports that he received no complaints as to its working, and he therefore presumes that its provisions are not repugnant to the feelings of the people. The law, however, is not suited to rural areas and can never be efficiently worked in them.

Results of the operation of the Compulsory Vaccination Act.

252. The effect on vaccination which the action of the Compulsory Vaccination Act has brought about during the year under review in the areas in which the law was in operation will be gathered from the subjoined table.

Districts.	Areas.	Total number vaccinated in 1884-85.	Difference as compared with 1883-84.		Percentage of successful operations to total number vaccinated.

The returns from the above-mentioned *Municipalities* show a very considerable improvement in comparison with the preceding year, inasmuch as there was an increase, on the whole, of 11,804 in the number of the operations performed, eliminating Balli, which forming a part of Howrah in the preceding year, furnished no separate returns, and Colgong, in which the work of both years was equal. Fifty-eight of the remaining 80 Municipalities in the above list contributed to the improvement—most largely, Calcutta (6,417 operations), Midnapore (1,959), Monghyr (1,509), Darjiling (1,314), North Suburban town (861), Bussirhat 791), Pubna (745), Ghattal (482), South Barrackpore (448), and Bhagulpore (441). On the other hand, the largest decreases in the number of the operations were returned by the Suburban (3,633), Patna (1,800), Gya (1,232), Howrah (1,024), Burdwan (910), Brahmanbaria (524), Berhampore (497) Municipalities. With regard to the quality of the vaccinations performed, many of the Municipalities exhibit inferior percentages, due no doubt to the close and systematic inspections of the work of the vaccinators by the Inspecting Officers, which prevented them from passing off fictitious figures.

With regard to the *rural* areas, while every thana in the *Bhagulpore* district exhibits increased operations, those in *Tipperah* show considerably diminished results, but this is accounted for by the withdrawal of the Government vaccinators to other areas.

Points on which the Compulsory Vaccination Act requires Amendment.

253. Opportunity was taken when reporting on the memorial presented to Government by Sir Richard Garth and certain other influential residents of Calcutta, complaining against the working of the Bengal Vaccination Act, 1880, in the Town, particularly with regard to their being no suitable accommodation for small-pox patients nor any hospital, to discuss the question as to the points on which the abovementioned Enactment required amendment. The amendments suggested by me were, (*a*) provision to be made for compelling unprotected persons to report themselves for vaccination instead of waiting for the serving on them of the notices prescribed by Section 11. (*b*) In cases where this notice has to be served, the period of 15 days allowed by it, within which an unprotected person is required to submit himself for vaccination, be reduced. (*c*) Under Section 3 of the Act, the parent or guardian is not *bound* to present a child for vaccination within the following periods, viz., if the child is born in Calcutta, within one year after its birth, and if a child of under 14 years of age is brought to reside in Calcutta, within six months after arrival, or if the child is at the time of its arrival less than one year old, within one year and three months after its birth. These periods are considered generally, both in the Metropolis and in the mofussil Towns, as too long, favouring the postponement of vaccination to which the people are naturally prone, and thus affording them the chance to remove their children in an unprotected condition. But the most serious result in connection with this defect is that, the most important and vital end for which vaccination has been established, viz., the suppression of small-pox, is rendered abortive, for it is well nigh impossible to extinguish the epidemic prevalence of the malady in an affected locality where there is a large number of unprotected subjects who cannot be operated on immediately. From the reply of Government it appeared that most of my suggestions had been already recommended by a Committee appointed by the Municipal Corporation of Calcutta to report upon the working of the Vaccination Act and was under the consideration of Government, and that this Committee had proposed further that the Act should also be amended so as to render re-vaccination compulsory at periodical intervals and to provide for the compulsory isolation of persons suffering from small-pox in suitable wards, so as to prevent infection. In connection with this point I was requested to report whether the balance of medical opinion in favour of re-vaccination is so decided as to justify Government in enforcing such a measure; if so, to indicate in some detail the measures that would be necessary to enforce the operation, having regard to the circumstances of Calcutta and the habits of the people, and to specify any measures that might, under the above circumstances, be legitimately taken to prevent the spread of infectious disease. I submitted the following report. That the balance of medical opinion in favour of the necessity of revaccination for the complete protection of any community from small-pox is overwhelming; that the necessity of its legal enforcement has often been favourably discussed in Medical Publications in England; and that, if His Honor finds that he is able to be guided by medical opinion alone, he will be fully justified in amending the Act. With regard to the detailed measures that would be necessary to enforce the operation under the circumstances of Calcutta and the habits of the people, I suggested that it appeared to me that revaccination could be successfully accomplished, provided the present system of house-to-house inspection is kept up; and that the officers of the Vaccination Department have powers granted them whereby they can legally examine persons found in Calcutta as to their state of protection, and, in the event of its being insufficient or doubtful, that they have power to serve notices on such persons, if in good health, requiring them to submit themselves to re-vaccination within a period of 15 days. That fines should be inflicted in case of recusancy. That the officers of the department should also have the right of entry into public institutions, such as schools, mills and factories, to enable them to ascertain the state of protection enjoyed by the scholars and employés. That it should be made a rule that all persons vaccinated, inoculated, or having

gone through natural small-pox in youth, should be obliged to submit to re-vaccination when adults; but that even before attaining to this period of life, the necessity of re-vaccination should rest with the Officers of the department. That it might be premature to amend the Act on the above points for the whole Province, but that their application to Calcutta, the Suburbs and Howrah is indicated. With regard to the measures which might be legitimately taken to prevent the spread of infectious disease, and taking small-pox as the type with which we have to deal in Calcutta, I recommended (*a*) that sufficient hospital accommodation should be provided, if such is not at present the case, for the isolation of all sufferers from small-pox in whose cases perfect segregation cannot be provided in their own houses, till the danger of infection is past. (*b*) That in the event of the Officers of the department finding that, from circumstances of family or dwelling, it is impossible to isolate patients in their own homes, that they have power to require their removal to the appointed hospitals and their detention there till danger of infection is past. (*c*) That the disinfection and, if necessary, the destruction, of clothing used by infected persons should be carried out by the Officers of the department; and that, in the event of thorough disinfection of articles, such as rezais, blankets, &c., not being immediately practicable, the Officers should have power to destroy them, compensation being given by the Corporation if the owners are in poor circumstances; but that it would be well, however, if the Corporation kept in possession disinfecting stoves, some of which are constructed so as to be moveable from place to place. (*d*) That the purification of houses should be placed within the powers and under the control of the Vaccination Department, and that they should be empowered to even order complete destruction of mat or other huts, as mats being very absorbent of small-pox discharges, cannot easily be dealt with by fumigation or otherwise, and that in cases of destruction compensation should be made by the Corporation. In addition I suggested that, it would be useful to make the notification of the presence of small-pox compulsory; that every householder, lodging house-keeper, or head of a family be required to report the presence of the disease at the Police Station in the jurisdiction in which his residence is situated, and that the police should then report to the Health Officer, Calcutta, or, in the case of the Suburbs and Howrah, to the Superintendent of Vaccination, Metropolitan Circles.

The Commissioner of the Orissa Division suggested certain amendments, principally verbal, in the rules framed under Section 33 of the Compulsory Vaccination Act to make them applicable to the Cantonment to which the law had been extended. I approved of the modifications, and suggested that the revised rules be printed for use in all the Cantonments in Bengal to which the Enactment may in future be extended.

During the year the Civil Surgeon of Midnapore enquired what action could be taken under the Bengal Vaccination Act in a case where an unlicensed and unqualified person is found to be practising vaccination and taking fees in a Municipality to which that Enactment had been extended, as he had reason to believe that such irregular vaccination was being carried on in the town of Midnapore, which seriously interfered with the proper working of the Act and rendered the people liable to indifferent vaccination at cheap rates. The question was referred to the Superintendent and Remembrancer of Legal Affairs, and that officer's opinion is that "there does not appear in Act V (B.C.), 1880, to have been any intention to prohibit private vaccination, and consequently no warrant for the Civil Surgeon regarding such men as criminals."

During the year the Health Officer of the Port of Calcutta reported that it was difficult to work the Compulsory Vaccination Act afloat, and that it was inapplicable to the shipping. The question was submitted to Government. The chief difficulties appear to be the allowing of 15 days from date of notice within which to accept of vaccination, the results being that the crews disperse before the 15 days have expired, and Commanders of vessels deliberately calculate the time which the loading of them will take up and withhold leave from their crews to enable them to get vaccinated, if they find that their vessels

will be ready for sea before the expiration of the limited time. There is also no provision existing in the law to prevent the unprotected on board pilgrim ships in which small-pox has broken out from leaving the vessels, it being at present optional with them to accept vaccination, and detention for the purpose is objected to. The Health Officer suggested the desirability of vesting the sanitary authorities with the power of limiting the spread of the disease in the localities to which the pilgrims may proceed, by the immediate vaccination of all unprotected persons found on board of not only pilgrim ships, but also of *all* infected vessels, on arrival, as no such power is given by section 13 of the Bengal Vaccination Act, which only provides for the serving of notices on unprotected persons warning them to have themselves vaccinated within 15 days. It was observed that within this limit men may leave their ships, take service in others, scatter over the town in sailors' boarding-houses, or disperse over Bengal, &c. The adoption of the practice obtaining in New York, where immigrant steamers are boarded by the Health Officer and vaccinators, and vaccination performed whenever necessary without delay, was suggested as the only efficient safeguard, and it was pointed out that in the event of this procedure being approved, it would be necessary to provide for the detention of such persons as might refuse vaccination until the period of incubation had, in their cases, been passed without the appearance of small pox. I also submitted this question to Government with my approval and with the further suggestion that the Health Officer should also have the power of re-vaccinating such of the men as in his opinion require it.

No orders have been received on the above references, but I suppose that they will be taken up in connection with the question of amending the Compulsory Vaccination Act, which, I believe, is yet under the consideration of Government.

Particulars regarding Inoculation.

254. The law prohibiting inoculation, Act IV (B.C.) of 1865, was extended during the year under review to the two remaining thanas of Faridpore and Goalundo in the district of Faridpore; to thanas Dumraon, Buxar, Peroo and Dhangain in the district of Shahabad; to thanas Begumgunge and Ramgunge in the district of Noakhali; to the remaining thanas Kasba, Daudkandi, Hajigunge, Chandpore, Laksham, Jagannathdighi or Chandogram in the district of Tipperah; to the remaining thanas of Hilsa, Mokamah, Patna and Bankipore in the district of Patna.

In the following places this law has not yet been brought into operation. The whole of the Backergunge district. *Chittagong.*—The whole district, excepting Chittagong town. Thanas Sundeep, Fenny, Chagalnaya, Hatia and Lakhipore in the *Noakhali* district. *Gya.*—The whole district, excepting the towns of Gya, Aurungabad and Jehanabad and thana Jehanabad. *Mozufferpore.*—The whole district, excepting Mozufferpore town. *Durbhunga.*—The whole district, excepting Durbhanga town. Thanas Sasseram, Khargher or Nokha, Bhabuah, Durgawati, Chand, Dehree, and Mohania or Ramgarh in the *Shahabad* district. *Sarun.*—The whole district, excepting Chupra, Revilgunge and Sewan towns. *Chumparun.*—The whole district, excepting Bettiah town and thanas Adapur, Dhaka and Motihari. Thanas Tegrah and Beguserai in the *Monghyr* district. *Cuttack.*—The whole district, excepting Cuttack town. *Puri.*—The whole district, excepting Puri town. *Balasore.*—The whole district, excepting Balasore town.

Metropolitan Circles.—Inoculation is not carried on in the Suburbs of Calcutta, and the Officiating Superintendent had no information of its practice anywhere in his Circle during the year. But the tenor of the local reports generally indicate that inoculation is a thing of the past in all the districts of this Circle, excepting Midnapore and Khulna, where, if in vogue, the practice is rare. In the *Darjiling* Circle it is believed to be hardly prevalent anywhere, one or two cases only having been heard of in the Purneah district. It, however, prevails in parts of Nepal bordering on the Darjiling district, in Sikkim, and in Bhootan, whence small-pox is liable to be introduced into the Circle. *Ranchi* Circle.—The Civil Surgeons of Hazaribagh and Manbhum say that the practice of inoculation is gradually dying out in these districts. In the *Sonthal Pergunnahs* Circle it is not practised in the Sonthal Pergunnahs district, but

prevails in parts of Monghyr and Bhagulpore, mostly in thana Beguserai in the former district, and even in some areas in which the prohibitory law is in force. Of course in those places in which the law is not in force it is universally resorted to. In the Monghyr district the rich people and the Bunneahs and others not only allow inoculation in their families, but also do everything in their power to protect and screen from punishment the inoculators when their practices are brought to light. Four cases of inoculation which occurred in Bungaon in Bhagulpore were reported to the Subdivisional officer. In the *Eastern Bengal* Circle wherever the Act is not in force inoculation is freely resorted to by the people and fostered by the wealthy Hindus. The practice is, however, reported to be dying out in Chittagong, chiefly due to want of *virus*, small-pox being almost absent from the district. In Noakholi it is said to be resorted to in places where it is difficult or impossible to secure the services of vaccinators. In Chandpore thana in Tipperah inoculation was freely practised both before and after the prohibitory law was brought into operation in it. Several of the inoculators were reported, prosecuted, and punished. It was also carried on in the Ramgunge thana in Noakholi. Here also two of the inoculators were prosecuted and punished. In the *Orissa* Circle it is freely practised in the interior of all the three districts of Cuttack, Balasore, and Puri encouraged by the wealthy, the Brahmins, Mohanties and Priests, and by the worshippers of the goddess of small-pox in the village of Berajah in the vicinity of the Jajipur town. It is said that any one in the Balasore town preferring inoculation to vacination, has simply to cross the municipal boundary, and have himself operated on without fear. In the *Behar* Circle inoculation is freely practised in the areas in which the prohibitory law is not in force, and even in some where it is in operation. It was extensively carried on in parts of the Shahabad district, chiefly by the inoculators to whom the Magistrate had granted perwannahs to practice vaccination, under circumstances mentioned in a foregoing portion of this Report. These men were troublesome in the extreme and greatly interfered with vaccination, notwithstanding that the Head vaccinators exerted their best to put a stop to their practice by prosecuting several of the delinquents, so that, according to the Superintendent, the promulgation of the prohibitory law did not virtually stop the practice of inoculation in this district. The Police Officers were reported to have been also here, as usual, quite indifferent in the matter, particularly in thana Arrah. The Civil Surgeon of the district, at the instance of the Superintendent of Vaccination, very rightly refused to grant licenses to inoculators or ex-inoculators, on the ground that they make use of the licenses to practice inoculation in places where it is prohibited. In the *Sitamurhee* sub-division in the Mozufferpore district the people are still opposed to have their children vaccinated, and seem to dislike the vaccinators. The Compulsory Vaccination Act is suggested as the only means of rooting out inoculation. Inoculation is universally practised in *Durbhanga* amongst all classes of the Behari community. The people have implicit confidence in it, and do not recognize its dangers. The operation is, as elsewhere, associated with religious ceremonials connected with the worship of Shitola, and it is owing to this religious association that it finds so much favour with the people. The practice is carried on in some of the villages in the *Behar*, *Hilsa*, *Masouri*, *Bickram*, and *Silao* thanas in the Patna district, notwithstanding that the prohibitory law is in force in them. Two of the inoculators were punished, but 21 cases from five villages were reported to the sub-divisional officer of Pattygunge outpost in thana Bickram, but "to no effect." Although prohibited in the *Behar* town by law, the practice of inoculation finds favour with the wealthier sections of the community. The Assistant Surgeon advocates the introduction of the Compulsory Vaccination Act to check this tendency.

Influence of Vaccination and Inoculation on Small-pox.

255. The reports show that, as a rule, the controlling influence of vigorous and well-directed vaccination in localities affected by small-pox had the effect of arresting the progress of the disease. Where the efforts in this direction were loose, spasmodic, or misdirected, such as was the case in the Sonthal Pergunnahs Circle, success did not follow the measure. I submit below the opinions of some of the Officers of the Vaccination Department on the relative

merits of Vaccination, Inoculation, and Non-protection. The figures illustrating these opinions have been collected carefully on the spot by the vaccination department, but they are limited and below the number furnished by the Registration agency so far as deaths are referred to, because the figures of this agency embrace entire districts. But partial as they are, the Vaccination department figures are more reliable. It is also to be regretted that deaths under each head of information dealt with could not be furnished by the Vaccination Department separately, as their absence deprives the deductions to be drawn from the information of their chief value.

Calcutta.—Dr. O'Brien, the Superintendent, says that, in accordance with the habit of the disease observed through a long series of years, 1884-85 ought to have been a year of maximum prevalence; instead of this, we find that for an epidemic year it shows very low figures. It may be said with much reason that the epidemic spread of the disease was controlled and abated by wide-spread vaccination. A special establishment of six vaccinators was employed for two months to stamp out the disease by pushing on vaccination in the immediate vicinity of infected houses, and on the expiration of this period a strong establishment in addition to the regular staff, with an Assistant Superintendent, was employed permanently, who made a regular and systematic enquiry to find out unprotected persons in some of the sections of the Town notorious for outbreaks of small-pox, reporting for prosecution a large number who evade the requirements of the law on the subject. In the previous year there were no prosecutions, but large numbers were then vaccinated during the hot weather and rains, and this had the desired effect of reducing the disease from an epidemic to a sporadic form. Dr. O'Brien notes that of 451 reported cases of small-pox enquired into, 335 were temporary residents and had been in the town for less than one year and that 116 had resided in it for upwards of a year, and that of this total 96 had been previously vaccinated, 116 had been inoculated, and 239 were unprotected; but that of the 96 post-vaccinal cases, 14 occurred among children recently vaccinated, before protection could be effectual.

Metropolitan Circle.—It is to be regretted that the Officiating Superintendent of this Circle could not collect sufficient data with regard to the influence of vaccination on small-pox. But from the figures he obtained it is seen that of 64 unprotected persons who were attacked by the disease, 19 died, being at the rate of 29·68 per cent. of the attacked, and that there were 39 ascertained outbreaks of the disease in the districts in this Circle, involving 936 persons, of whom 100 had been inoculated, 67 had been vaccinated, 4 had natural small-pox, and 765 were unprotected—and that in the Suburbs of Calcutta there occurred 122 cases, of whom 13 had been inoculated, 6 vaccinated, and 103 were unprotected, the deaths numbering 57. I may mention here that of the 39 outbreaks abovementioned, 12 were traced to contagion, the history of which (too long for reproduction here) has been furnished in detail, fully establishing the fact; and that of these 12 outbreaks, traced to contagion from a distance, 9 were found to have been imported from Calcutta to light the fire in the unprotected localities in the mofussil to which the infected went, and this, Dr. Ghose thinks, corroborates the view taken by the Commission appointed to enquire into the sanitation of Calcutta, that "it was rather Calcutta and its Suburbs which were the centres from which contagion passed into the mofussil than *vice versa.*" He also submits that inoculation does not give actual protection, as is proved by the high percentages of success in re-vaccination. Thus in 43 cases of vaccinations in certain villages in thana Midnapore, he found 26 re-vaccinations all successfully operated on, and Assistant Surgeon Jogendro Nath Bhattacharjee reports that he saw six vaccinated persons in Jeliaparah in the Suburbs of Calcutta who had been inoculated in childhood; and that in all these cases the operations looked very well, the vesicles being typical. Dr. Tomes, the Civil Surgeon of Midnapore, reports that in an outbreak which occurred in the Town the benefit of vaccination was exemplified in a striking manner which could not fail to attract the notice of the people, inasmuch as the disease constantly singled out unprotected in-

dividuals of a community, the protected occupying the same house or group of houses always escaping.

Sonthal Pergunnahs.—It is a significant fact, affording inferential proof of the benefits of vaccination, that in the Monghyr and Bhagulpore districts, where small-pox has been prevailing with a persistency unapproached by any of the districts in the other Circles, where vaccination is strongly resisted, and where, consequently, there are a large number of unprotected subjects, no less than 7,011 cases of small-pox were reported to have occurred during the year under review, attended with 1,114 deaths, yielding the percentage of 15·89 to number attacked.

Eastern Bengal Circle.—In this Circle there occurred 656 cases of small-pox, of whom 64 were protected, 49 by vaccination and 15 by inoculation; and the unprotected numbered 592, or in the proportion 90·24 per cent. of the number attacked. The Civil Surgeon of Dacca reports that in a severe outbreak of small-pox in the Dacca town it was observed that the highest mortality occurred in that part of it where the greatest resistance to vaccination was offered; and that it is worthy of note that in a Mahomedan family, consisting of 400 members, the majority of whom had been vaccinated or re-vaccinated, small-pox did not attack the protected members, whereas among the other members who would not allow themselves or their children to be vaccinated, there were many cases and several deaths. In the Mymensing Jail, of the total number admitted during the year, amounting to 1,944, 180 or 9·26 per cent. of the admissions were found to have been vaccinated, 1,189 or 61·11 per cent. to have been inoculated, 274 or 14·10 per cent. had small-pox, and 301 or 15·48 per cent. were unprotected.

Behar Circle.—The report from this Circle shows that of 583 cases of small-pox only 3 were protected, 2 by vaccination and 1 by inoculation, and 580 or 99·48 per cent. of the total number of cases were unprotected.

The subjoined statement exhibits, collectively, the figures illustrating the subject under consideration furnished above.

Circles.	Total number of cases of Small-pox.	Number protected by				Number Unprotected.	Ratio per cent. to total cases of the number				
		Vaccination.	Inoculation.	Natural small-pox.	Total.		Protected by Vaccination.	Protected by Inoculation.	Protected by natural Small-pox.	Total.	Unprotected.
Calcutta	451	96	116	......	212	239	21·28	25·72	......	47·01	52·99
Metropolitan Circles	936	67	100	4	171	765	7·16	10·68	·43	18·27	81·73
Suburbs of Calcutta	122	6	13	......	19	103	4·92	10·65	......	15·57	84·43
Eastern Bengal Circle	656	49	15	......	64	592	7·47	2·29	......	9·76	90·24
Behar Circle	583	2	1	......	3	580	·34	·17	......	·51	99·49
Total ...	2,748	220	245	4	469	2,279	8·00	8·92	·15	17·06	82·93

The foregoing facts and figures, carefully considered, will be found to furnish evidence in favour of Vaccination as possessing greater protective power than Inoculation; and to show that those protected by either process, but particularly by the former, are less liable to the ravages of small-pox than the entirely unprotected, or in other words, are not attacked by, and do not succumb to, the disease in such large numbers as the Unprotected.

SECTION VIII.

SANITARY WORKS (MILITARY).

256. The information under this section is not required from the Sanitary Commissioner for Bengal.

SECTION IX.

SANITARY WORKS (CIVIL).

MUNICIPAL EXPENDITURE ON SANITATION.

Total income of Municipalities and Objects of expenditure.

257. The income of the Municipalities in each district and the purposes for which it was expended are shown in the subjoined table:—

Districts.	Number of Municipalities and Unions.	Income in 1884, including balance from the last year.	Percentage of Income expended on— Sanitary Works. 1884.	1883.	Roads.	Sanitary Works including Roads.	Police.	Other requirements.

Manbhum ...	3	20,475 8 5	29·52	36·73	11·58	41·10	...	6·15
GRAND TOTAL ..	175	32,78,326 0 2	37·60	34·48	19·17	56·77	2·19	15·67

From the above table it is seen that the total income of all the Municipalities amounted to Rs. 32,78,326 against Rs. 33,28,762 in the preceding year, showing a diminution of Rs. 50,436. Of this income 38 per cent. was expended on Sanitary Works (original and recurring) against 34 per cent. in the preceding year; 19 per cent. on Roads against 18 per cent.; 2 per cent. on Police against 3 per cent.; and 16 per cent. on other requirements against 15 per cent. Thus it will be observed that, notwithstanding a serious diminution of income, the apportionment for Sanitary Works was greater than in the preceding year. To this increment the towns in 25 of the 45 districts contributed at rates ranging from ·16 per cent. in Mozufferpore to 21·71 per cent. in Patna. The towns in the districts named below utilized the following percentages of their revenues in improving their sanitary status:—

	Percentage of income.		Percentage of income.		Percentage of income.
Julpaiguri ...	63·35	Monghyr ...	44·89	Murshidabad ...	36·15
Dacca	53·47	Birbhum ...	43·91	Dinajpur ...	35·83
Hazaribagh ...	52·17	Chumparun ...	43·48	Singbhum ...	35·50
Burdwan ...	51·50	Darjiling ...	42·31	Cuttack ...	34·30
Puri ...	51·39	Rungpore ...	41·71	Sarun ...	34·24
Midnapore ...	50·58	Maldah ...	40·49	Hughli including Serampore.	34·04
Shahabad ...	48·13	Tipperah ...	38·98	Durbhanga ...	34·03
Patna ...	46·26	Lohardugga ...	38·36	Pubna ...	30·87
Bhagulpore ...	46·25	Gya ...	37·61	Rajshahye ...	30·19
Sonthal Pergunnahs	45·31	Howrah ...	37·40	24-Pergunnahs ...	29·69
Jessore ...	45·19	Balasore ...	36·21	Manbhum ...	29·52

On the other hand, the towns in the districts of Mymensing, Khulna, Bogra and Noakholi did the worst in this direction, their percentages being only 13·67, 17·44, 21·03 and 23·27 respectively. In the remaining towns the percentages of income diverted towards sanitary improvements ranged from 25·15 to 28·95.

Details of Expenditure on Sanitation.

258. The special purposes for which the amount allotted for the Sanitation of towns (Rs. 12,32,789 against Rs. 11,47,930 in 1883, exclusive of Rs. 6,28,578, the cost of constructing and maintaining Roads) was expended are marginally indicated. Compared with the preceding year, commendable improvement is observable under all the heads, excepting Establishment and Water-supply. The decrease under the latter head is traceable to considerably larger amounts having been expended for the purpose during the preceding year in Burdwan (Rs. 1,10,519 against Rs. 74,972 this year) and in Darjiling (Rs. 10,523 against Rs. 3,737).

GENERAL PROGRESS IN SANITATION.

Description of Sanitary Works executed in Towns and Districts.

259. Details of the *original* Sanitary Works, excluding the recurring works incidental to every year, are furnished in Appendix IV to this Report. The subjoined abstract taken from this Appendix shows the amount expended for original Sanitary Works, the proportion this amount bears to the total income, and the general nature of the Sanitary Works executed in all the Sudder Municipalities and in those of the minor Towns in which the population numbers 10,000 and upwards. This abstract also indicates the Towns whose sanitary welfare was well attended to, and those in which this matter was more or less neglected. Of the rest of the minor Towns, the following expended nothing on works of the description under consideration:—Dainhat in Burdwan; Patroshair and Joypur in Bankura; Ramjibunpur in Midnapur; Mugra, Panduah, Bali, Utterpara, Kotrung and Koerganj in Hughli; North and South Barrackpur and Taki in the 24-Pergunnahs; Jessore; Goalundo in Faridpore; Burisal and Bauphal in Backerganj; Cox's Bazar in Chittagong; Sudharam in Noakholi; Comillah in Tipperah; Barrh, Futwa and Maner in Patna; Tikari, Sherghatti and Fatehpur in Gya; Dumraon and Bhubuah in Shahabad; Balasore; Garwa in Lohardugga; and Raghunathpur and Jhalda in Manbhum. The remaining towns expended, generally, insignificant sums, but these sums taken collectively amount to Rs. 64,249.

The observation which a review of the above table forces upon attention is that the Suburbs of Calcutta, where sanitary reforms are greatly—I should say imperatively needed—expended only 1·24 per cent. of its large income on *original Sanitary Works.*

260. Of the Sanitary Works which were under consideration during the year, and most of which are briefly referred to in the foregoing abstract, those which claim attention as important sanitary measures calculated to confer much benefit are the following:—

IMPORTANT SANITARY WORKS.

In the Towns.

Water-supply.—The construction of the *Burdwan* water-works has been completed, and they were formally opened by His Honor the Lieutenant-Governor on the 4th of November 1884. The regular supply of water commenced from the 1st of December. The measure has proved, it is said, to be of great benefit to the inhabitants of the northern portion of the town in which the pipes have been laid and hydrants set up. At first many of the inhabitants were unwilling to use the filtered water, but the prejudice soon died away, and now about 99 per cent. of the inhabitants have been freely using it. Many of the respectable inhabitants who were opposed to the water-works scheme on the ground that there was no necessity for it at Burdwan have candidly admitted that they had been mistaken, and that the water-works are really a great boon to the inhabitants. Owing to the scanty rainfall during the last two years many tanks have dried up, and there would have been scarcity of water in some parts of the town, if the water-works had not been completed. The supply of water is ample, and the Government Chemical Examiner's opinion is that, "the water is of good potable quality." The Commissioners have sanctioned house connections, which will be soon established. There are altogether 60 hydrants, but applications for more have been made by the inhabitants. It is hoped that early steps will be taken to confer a similar boon on the people in the southern side of the town, who compose about a third of the population, and who continue to obtain their water-supply from the Banka nulla and Eden canal. But the conservancy of the Banka nulla, from which the water-supply is taken, is very bad. The Civil Surgeon, after a tour of inspection, remarks that, a great deal of jungle overhangs the nulla, and a considerable quantity of vegetation, in all stages of growth and decay, are in its bed. At many places numerous strata of black vegetable mould were seen on the banks where slips have occurred. Large herds of cattle are permitted to swim across the nulla, which must cause considerable pollution, and crushing away of the banks is inevitable. Below where the water is taken off a great part of the town sewage finds its way into the Banka, and when the water at the back of the station gets low, very often a most offensive smell arises from its bed. *Hughli.*—Mr. Finlay, the manager of the Wellington Jute Mills in the Serampore Municipality, has recently had a large cistern constructed capable of containing 73,000 gallons of water from the river, of comparatively pure quality, for the benefit of the work-people in the Mahesh and Rishra bustees. *Howrah.*—The Commissioners of this Municipality have now made arrangements for the preparation of plans and estimates of an approved scheme of water-supply in which the other riparian towns are to join. The estimates, &c., are to be undertaken at a cost of Rs. 3,168 by Mr. Scott, Executive Engineer, whose services for this project have been lent by Government to the Municipality free of cost. At an assembly of delegates from the Kotrung, Serampore, Bali and Baidyabatti Municipalities, the President of the Howrah Water-supply Committee enquired if they were authorized by their respective Municipalities (who had been advised of the matter before) to agree to bear a share of the cost of the plans and estimates. The representative of the Baidyabatti Municipality stated that the Commissioners of that Municipality would contribute, and the other delegates agreed to advise the Municipalities which they represented to contribute. The *Bali* Municipality subsequently consented to a *pro rata* contribution for the purpose. *Rajshahye.*—Opportunity was taken, at the height of the flooding of the Ganges during the rainy season, to flush out the tanks and wells, and to wash out the drains and stagnant pools in the Beauleah and Nattore Municipalities, and thus a thorough cleansing was effected. The inhabitants of the villages in the neighbourhood of these water reservoirs availed themselves of the purer water thus secured, by cutting drains to various distances, and in some cases through public roads and embankments, to introduce the water into the tanks, which had dried up owing to the insufficient rainfall of the past three years. In the *Dacca* town, the

further improvements to the filter beds, calculated to prevent leakage, were completed, and a tunnel giving access at all times (except during the highest floods) to the suction pipe was constructed. The Civil Surgeon believes that now the leakage of subsoil water into the reservoir of clean water has been effectually prevented. An out-house for the water-works, and a man-hole for the south tunnel have also been constructed. The above works cost Rs. 3,656-6-9. Moreover, a boundary wall to the water-works premises has been erected at a cost of Rs. 987-2-6. The land required for building thereon additional settling tanks and filter beds, for the purpose of extending the water-supply, has been acquired and cleared of all huts and buildings. The munificent Nawab Assanoollah has, in commemoration of the visit to India of their Royal Highnesses the Duke and Duchess of Connaught, extended the water-works northwards up to Nawabpore road. The locality along this line is a crowded one, and its water-supply used to be obtained from wells and tanks. Considering the extremely bad condition of these wells and tanks, this undertaking has undoubtedly been a great boon to the inhabitants. The Nawab expended Rs. 11,000 on this work. Mr. A. J. Hughes, the Officiating Superintending Engineer, Sone Circle, evinced great and commendable interest in the sanitary welfare of the *Mozufferpore* Municipality. Among his suggestions for improvement was one relating to water-supply, which is a matter of urgent necessity in this town. He proposed to the Municipal Commissioners to utilize the water of the Gunduck river for drinking purposes, the purity of which was established by use in the jail. This river flows directly under the town, and his scheme was to establish a pumping station on a piece of waste land belonging to the Maharaja of Durbhanga; to raise the water of the river there and deliver it into suitable settling tanks; to cause the water to flow by gravitation from the settling tanks into filters and be stored in a covered masonry reservoir, from which it could be pumped for delivery to the town through hydrants or stand-posts fixed in different parts thereof. House connections were also to be allowed. His scheme was calculated to deliver about 5 gallons of pure filtered water per head of the population, sufficient for drinking and cooking purposes. It is to be regretted that the Municipal Commissioners negatived this very important measure, which would, no doubt, have benefited both the rich and the poor. They were of opinion that excellent water is procurable from the wells in the town, while the water of the little Gunduck is dirty and contaminated, which they say will not be touched by the people. They, moreover, stated that a scheme which would cost Rs. 2,10,000 for plant, &c., and Rs. 24,609 per annum for interest and working expenses, was quite beyond their means, considering that their annual income was about Rs. 32,000. In the *Bhagulpore* town, the water-work project, referred to in the report of 1882, has been sanctioned by Government, and material and plant are being collected for carrying it out. The Government has lent the services of the Superintending Engineer and his subordinates for the undertaking free of cost. The work, it is believed, will be completed within 14 months.

In the Districts.

261. Reports regarding the analyses of water of all places from which it is sent to the Chemical Examiner to Government are now regularly sent to me for approval and opinion. The most important of these is the water-supply of the Nuddea district, which the Collector of that district sent to the Chemical Examiner with a set of questions relating to it [prepared in consonance with the orders of Government No. 32 (Medical), dated 19th January 1880] to be answered. As the prevalence of malarious fever and other zymotic diseases throughout Nuddea is generally stated by those experts who have given their attention to the subject to be due to an impure water-supply, it was thought that wells, properly constructed, can give the people pure water. It was, therefore, proposed to construct wells at some selected sites to demonstrate how far they may be safely used as a source of rural water-supply. The question was referred to me by the Chemical Examiner, and I urged that officer to analyse the water sent. This analysis was the more necessary because, for some reason which has never been clearly explained, the people of the district will rarely use well water, saying that it gives them cold and nasal catarrh. It was, therefore, desirable to know if the water is loaded with salt, or otherwise so impure as to tend to the production of such complaints. The

enquiry is at present incomplete. *Rajshahye.*—The mouth of the Narod river in this district, which had silted up, was excavated at a cost of Rs. 1,000, with a view to afford the people good water from the Ganges, and to inundate the bordering villages and the bhils situated within easy reach. The mouth of the Dhobapara khal, which joins the Hoja river with the Moishakhan river, and of two other water-ways, one through Putia thana and the other from Achintola, all of which had silted up, were opened. By this measure the annual flooding of the Moishakhan river was partially restored, and the stagnant Hoja, to which was ascribed the prevalence of the epidemic fever of a virulent and persistent type referred to in paragraph 129 of this Report, was to some extent flushed. It is under consideration to deal with the Mudungachi embankment so as to enable the country to be flooded for the purpose of both irrigation and the cleaning out of tanks. The *Sarun* canal was improved at a cost of Rs. 20,000.

262. *Drainage.*—The improvement of the drainage of the *Raniganj* town in Burdwan is awaiting the report of the Engineer on the proposed scheme, the levels having been taken. At *Khulna*, the head-quarters of the district (converted into a Municipality at the close of the year), the drainage was diverted from its previous channels towards new channels with a view to improve the sanitation of the place, at a cost of Rs. 16,997 to the Road Cess Department. The work has progressed to a good extent. In *Lalbagh* or *City Murshidabad* the drainage works at Azimganj, commenced in 1883, have been completed. and the outlet, it is said, is now effective. Owing to want of proper flushing the two main channels within the Shamnagar and Mohimapur wards did not work well through the pipes, which are only 6 inches in diameter. The pipes are already a good deal blocked up with silt, and there is no means of cleaning them unless they be taken up and relaid---a work requiring much attention and enormous cost. Proposals referring to proper drainage schemes for Jeagunj and *Azimgunj* and to the improvement of the present drainage system of the *Murshidabad* town proper, estimated to cost Rs. 30,000, are under consideration. Estimates and plans of the scheme for improving the drainage of the *Dinajpur* town, in connection with the general drainage project suggested by the Sanitary Commision of 1878, have been submitted to Government for sanction. The Maharaja of Dinajpur has promised to defray the cost of the project, and it is to be called the "Thompson Drainage Scheme," with a view to commemorate the visit to Dinajpur of His Honor the Lieutenant-Governor of Bengal. The scheme for improving the drainage of the *Chittagong* town, referred to in the Report for 1883, has not yet been taken up. With reference to this subject the Civil Surgeon writes:—"In my last report I mentioned that Government had taken up a very important drain running through a very crowded part of the town. Surveys, reports, estimates, &c., were submitted by the Public Works Department, but, as usual with these things, the labour expended in making the plans, &c., has all been wasted in some pigeon-hole at head-quarters. The scheme for re-digging the Chaktai nulla has also fallen out of sight. This, if carried out, would have immensely improved the drainage of a very large area of low-lying ground to the great advantage of the inhabitants therein. In fact, nothing can be done to drain this area till the Chaktai is re-dug." The question of radically improving the drainage of the *Patna* Municipality was under consideration during the year. The Municipal Engineer was engaged throughout the rainy season in investigating the matter, and has drawn up some excellent reports on a general drainage scheme. But it appears that it is beyond the means of the Municipality to give effect to the undertaking, and that it would entail the raising of a large loan, take years to complete the work, and involve loss of money in surveys, &c. An alternative plan for providing the whole town with pucca spoon-shaped drains to carry off rain water only is under consideration. The work of this year consisted of constructing surface drains in three of the mohullas, and completing (1) the largest pucca main drain, which conveys the drainage of an immense area under the railway line and then discharges it into low ground; and (2) the most important pucca sub-main drain, which conveys the drainage from the densely-populated parts near the chowk to the abovementioned main drain. These works have, it is said, already proved of the greatest service. Their extension is necessary, but want of funds precludes this being done.

In the Towns.

263. In the *Midnapore* district Rs. 88,600 were expended on the drainage of the Supai khal. Further improvements to the drainage of the fever-stricken district of *Nuddea* were effected, the work consisting of the construction of a good many arched culverts and wrought-iron girder bridges on masonry abutments; of the completion of the works on the road from Chagda railway station to Bongong at a cost of Rs. 1,346; and of the construction of four arched culverts on the Chapra and Nishchindpur road at a cost of Rs. 1,967. These culverts span drainage channels. Many drainage schemes were prepared during the year, and some of them have been sanctioned, but none of them have yet been carried out for want of funds—and some elaborate schemes are under preparation. In the *Sonthal Pergunnahs* district the question of draining the stagnant marsh to the south of Rajmehal is still under consideration. Plans and estimates have been prepared, and enquiries are being instituted as to how far the proprietors of the land are prepared to contribute towards the project; but there are so many petty interests involved that it is doubted whether they will combine in carrying out the work. This is much to be regretted, for the Deputy Commissioner says that, "the extreme unhealthiness which has led to the almost total depopulation of the tract once teeming with a wealthy Mussulman population, is said to be almost entirely due to the existence of this swamp, which was formerly an old bed of the Ganges, and became converted into a jheel when the river receded. The high bank then thrown up cut off the drainage into the river, and the water has remained stagnant in it ever since, now some 40 or 50 years. The bottom of the swamp, which is partially exposed during the dry season, consists, it is said, of some 10 to 15 feet of decaying vegetation. There is little or no open water in the jheel, which is covered with a long reed."

In the Districts.

264. *Bustees.*—In the *Suburbs of Calcutta* the improvement of Woolfut-bagan bustee has been taken in hand; the Motijheel and Kantal-bagan bustees have been inspected preliminary to sanitary improvements being carried out, and six other bustees, among which are the gowalla bustees regarding which it is proposed to establish public cow-sheds, have been surveyed. Regarding bustee improvements in the Suburban Municipality, His Honor the Lieutenant-Governor has remarked that "it is imperatively necessary that more rapid and effectual progress should be made in reclaiming the bustees and otherwise improving the sanitary condition of the town; and the Commissioners should understand that this a subject to which the Government attaches the highest importance and to which their most earnest attention must be given." In the *Howrah* town the Rajapara, Kozedangali and Kajal-bagan bustees have been improved.

265. *Conservancy.*—The wire tramway in the *Darjiling* Municipality, estimated to cost Rs. 7,841, is in progress. In the *Dacca* Municipality three of the abominable "Gors" were completely filled up. *Patna* Municipality.—It is gratifying to find that after much opposition and controversy, the house-scavenging scheme has been established in the City Proper, which is most thickly populated. Five thousand, or half the number of private privies are being cleaned, and the night-soil from them is trenched in grounds specially rented for the purpose.

266. **Port of Calcutta.**—The Health Officer had to draw the attention of the authorities eight times to the neglect of the sanitary arrangements on the Calcutta foreshore and only once with regard to the Howrah foreshore.

Calcutta and Howrah Foreshores.

267. It does not appear that any progress has been made in providing additional latrines on the town side of the Strand road beyond the selection of sites for the purpose, although the Government drew the attention of the Calcutta Municipal Corporation to the subject.

Public Latrines on Calcutta Strand Road.

268. The arrangements under this head were satisfactory, except that once the attention of the municipal authorities had to be drawn to the use of the tanks with improperly fitted covers, which exposed the water to the risk of contamination.

Water-supply to the Shipping.

269. Proper attention appears to have been paid to this matter, as no complaints were received from the Shipping of annoyances caused by floating corpses.

Corpses and Carcasses in the River.

MISCELLANEOUS SANITARY OPERATIONS DURING THE YEAR.

Extension of Sanitary Laws.

270. The great event of the year under this head was the passing of the new Bengal Municipal Act III of 1884, which contains excellent sanitary regulations relating to sewage, offensive matter, rubbish, privies, drains, *sections* 186 to 197 and 232; to bathing and washing places and tanks, 198, 199 and 200; to obstructions and encroachments on roads, 201 to 208 and 233 to 235; to general conservancy and improvements, 209 to 219; to excavations, 232; to buildings and blocks of huts, 236 to 248; to sale of food, drink and drugs, 249 to 253; to burial and burning grounds, 254 to 260; to offensive and dangerous trades and occupations, 261 to 265; to water-supply, 299 to 307; to lighting with gas, 308 to 319; to construction and cleansing of latrines, 320 to 334; to markets, 335 to 345; to registration of births and deaths, 346 to 349; and to framing of bye-laws, 350 to 352. This enactment was given effect to on the 1st of August 1884, when all the first and second class Municipalities in which the old repealed Municipal Act V (B.C.) of 1876 was in force came under its operation without distinction as to classification, and the unions also ceased to be such. The law was also extended to Khulna, constituted a Municipality during the year, and to the Julpaiguri and Assensole towns, in which the old Act was never in operation. At first the whole of the new Municipal Act was not, in accordance with the provisions made in it, extended to many Municipalities, but the omitted sections are being gradually brought into operation in them according to requirements, and for some towns bye-laws, framed under the Act, have been sanctioned.

The places to which Act IV (B.C.) of 1873, rendering registration of births and deaths compulsory, were extended are mentioned in section V of this Report, and those in which Act IV (B.C.) of 1865, prohibiting the practice of inoculation, and Act V (B C.) of 1880, rendering vaccination compulsory, were brought into operation, in section VII.

The following enactment was also passed :—Act I (B.C.) of 1884, further amending the "Puri Lodging House Act," IV (B.C.) of 1871.

Another important enactment calculated to benefit sanitation greatly is the Bengal Local Self-Government Act, which was passed by the Bengal Legislative Council in April of the current year, and is awaiting the sanction of the Supreme Government to become law. The District Boards appointed under this law are to provide for the proper sanitation of the districts, to appoint Sanitary Inspectors, to provide a proper and sufficient supply of water, to provide for and supervise vaccination, to appoint Inspectors of Vaccination who are to exercise the powers and perform the duties assigned to the Superintendents of Vaccination under the Bengal Vaccination Act, 1880, to take measures for the relief of famine, to control and supervise dispensaries or hospitals, to submit returns of births and deaths to the Magistrate, and to undertake and carry out any local work likely to promote the health, comfort, or convenience of the people otherwise not provided for. The Union Committees appointed under the same law are to control, construct, and maintain roads, to maintain and manage dispensaries, to provide for the registration of births and deaths and submit to Local Boards returns thereof, to provide for sanitation, to control all drains and other conservancy works, and to control and manage the water-supply, all these work being performed within their Unions.

Qualifications of Sanitary Inspectors and Inspectors of Vaccination appointed under the Local Self-Government Act.

271. In connection with the above law, I submitted, at the request of Government, my opinions regarding the qualifications of Sanitary Inspectors and of Inspectors of Vaccination to be appointed by District Boards. With regard to Sanitary Inspectors I said that they should be men of some medical training, who have qualified as Native Doctors or Hospital Assistants in the Campbell, Patna, Dacca, or Cuttack Medical Schools, or in the Medical College of Calcutta; that men without medical education, but who had been employed for a considerable time in Municipalities as Conservancy Overseers and had exhibited physical fitness and intelligence in the performance of sanitary inspections, might also be employed; and that in any case some medical or sanitary training and perfect physical fitness must be insisted on. With respect to Inspectors of Vaccination, I stated that they should be men who have been well-trained in the different Vaccination Circles and are certified

as qualified for the post of Inspector by the Superintendent of the Circle from which they come; that they must be well acquainted with the natural history of the vaccine disease, the mode of operating, the preservation and storing of vaccine lymph, and the steps to be taken for the suppression of outbreaks of small-pox; and that they must be conversant with the vaccine returns required by Government and the enactments relating to inoculation of variolous matter and compulsory vaccination. I also submitted that it was essential that both the above classes of officers must be men of good character, as, unless very strictly supervised, they will have opportunity of extorting money from the people. In connection with the above suggestions the following draft rule has been framed for adoption when the Local Self-Government law is brought into operation:—

"*Section* 138, *clause* (*g*,) *Sanitary and Vaccination appointments.*—The qualifications for the Sanitary Inspector and of the Inspector of Vaccination shall be such as the Sanitary Commissioner may from time to time prescribe or approve."

The following draft rules relating to matters therein alluded to were also approved by me:—

"*Section* 138, *clause* (*n*), *Sanitation.*—Before drawing up the estimate of annual expenditure it shall be the duty of the District Board to consult the Sanitary Commissioner as to the sanitary works or improvements which are most urgently required in the district.

"2. No original sanitary work estimated to cost, or which is likely to cost, more than Rs. 500 shall be commenced until the approval of the Sanitary Commissioner has been obtained.

"3. It shall be lawful for the District Board to institute a prosecution, or to take other legal action, for abating any public nuisance involving actual danger to the health of the inhabitants of any part of the district.

"4. The District Board, or any officers authorized by them on their behalf, may, between sunrise and sunset, after giving 24 hours' notice in writing, enter upon and inspect any immoveable property in regard to which it has been alleged that a public nuisance exists involving actual danger to the health of the inhabitants of any part of the district."

Deputy Sanitary Commissioner, Metropolitan Circles, proposed to be *ex-officio* Municipal Commissioner of the Suburban Municipality.

272. As there was no provision in the amended Bengal Act III of 1884 whereby the Government may appoint the Sanitary Commissioner an *ex officio* Municipal Commissioner of Municipalities in the Province, I suggested to Government that it would be useful to nominate the Deputy Sanitary Commissioner of the Metropolitan Circles as a Commissioner in the Suburban Municipality of Calcutta, as during the recess season he might give much attention to sanitary matters in the Suburbs and afford advice and assistance to the Chairman and the Commissioners.

Submission of annual returns to Inspector-General of Civil Hospitals, showing how Sanitary and Vaccination duties have been performed by Civil Surgeons. These returns serve important sanitary purposes.

273. Under orders No. 1327, dated the 11th December 1884, I am required to forward an annual statement to the Inspector-General of Civil Hospitals, indicating the manner in which the Civil Surgeons performed their Vaccination and Sanitary duties, to enable that officer to submit to Government confidential reports regarding the officers in question annually. In order that I may be in a position to furnish this report, I issued a circular to all Civil Surgeons requiring them to submit quarterly reports as to the manner in which they performed such duties. These reports are being forwarded, and they serve very important sanitary purposes. In the first place they naturally induce the Civil Surgeons to look after the sanitary interests committed to them systematically, in order that they may be in a position to submit a proper report; and in the second place I am kept informed of the progress vaccination is making, of the sanitary condition of the towns, what improvements have been effected, and what diseases have prevailed or are prevailing in them with noticeable severity. I am thus enabled to take early corrective action in these matters. It is hoped that the registration of births and deaths will also be benefited by this measure.

Summary of recommendations made by Commission appointed to enquire into the sanitary condition of Calcutta.

274. Public attention being directed to the inadequate measures adopted by the Calcutta Municipal Corporation for the maintenance of the sanitary condition of the town, the Lieutenant-Governor, in exercise of the powers conferred upon him under section 28 of Act IV (B.C.) of 1876, appointed, under orders, Municipal Department, No. 1341T—M, dated the 3rd September 1884, and Government Notification of 14th August 1884, a Commission consisting of myself and the Honourable H. Beverley, associated with Mr. Cotton, appointed by the Calcutta Municipal Corporation, to enquire into and report on the adequacy or otherwise of the provisions made by the Commissioners for the cleansing and conservancy of the town, and to state whether these are defective to an extent likely to be prejudicial to the health of the inhabitants of the town or any part thereof, and, if such should be the case, to specify what further provision should be made for that purpose up to the end of 1885-86, with an estimate of its cost. An exhaustive enquiry was made into all matters regarding drainage, water-supply, new roads, bustee improvements, and general conservancy, in connection with statistics of mortality from fevers, typhoid fever, cholera, bowel-complaints, small-pox and other causes, and a Report was submitted to Government on the 19th of January 1885. The following is a summary of the recommendations made in that Report.

Under the head of *Drainage* it was proposed—1 That unfiltered water be laid on to as many sewer summits as possible with a view to the more effectual flushing of the pipe-sewers. 2 That an addition of from 5 to 10 per cent. be made to the establishment for cleaning the sewers, with a view to the more frequent examination of the pipe-sewers. 3 That the connection of house and surface drains with the sewers be pushed on more rapidly. 4 That the supervision of house drainage be improved. 5 That the underground system of drainage be extended to Hastings. 6 That the drainage of Bagh Bazar be taken into early consideration. 7 That the Mahratta ditch be obliterated.

In regard to *Water-supply*—8 That greater economy be exercised in the use of filtered water for road watering and flushing drains and latrines. 9 That more stand-pipes be erected in bustees. 10 That the extension works be pushed on as rapidly as possible. 11 That more rapid progress be made in the distribution of unfiltered water in the principal streets. 12 That foul tanks be filled as fast as possible under the present system. 13 That foul tanks which cannot be filled be dewatered and guarded in the hot season. 14 That section 233 of the Act be more strictly enforced. 15 That some restriction be placed on making excavations. 16 That the Corporation obtain power to fill wells and to forbid the sinking of wells in unwholesome localities. 17 That the river water used at the bathing-platforms be periodically analysed. 18 That at least seventy-five bathing-platforms in all be constructed before the close of the year 1885-86.

As regards *Latrines*—19 That wherever possible privies should have unfiltered water laid on and be connected with the sewers. 20 That the public latrines be made free. 21 That separate latrines be constructed for women. 22 That zemindari latrines be connected with the sewers and with the water-supply. 23 That more public latrines be erected. 24 That more urinals be erected. 25 That the supervision in the night-soil department be improved. 26 That better provision be made for the removal of cowdung either through the sewers or by carts.

In respect to *Roads and Conservancy*—27 That the roads in the north of the town be provided with side drains. 28 That the road-scraping establishment be increased by 20 per cent. 29 That the road-sweeping establishment be increased by 20 per cent. 30 That the establishment for removing horse droppings be increased. 31 That the number of conservancy carts and cattle be increased. 32 That the railway platform accommodation be increased and improved. 33 That the rolling stock of the railway be increased. 34 That the supervising agency in the roads and conservancy department be strengthened. 35 That all the surface conservancy be placed under an executive Health Officer.

And *generally*—36 That the registration of births and deaths be placed more directly under the control of the Health Officer. 37 That the Suburbs be placed under the same Municipal administration as the town.

Traffic in Rags at Railway Stations how to be controlled.

275. In connection with a question regarding the traffic of rags at Railway Stations which was supposed to have occasioned an outbreak of cholera among the employés of the paper mills at Gwalior, I submitted that I agreed with the following recommendations of the District Traffic Superint ndent of Tundla for regulating so objectionable a traffic; that these recommendations might with advantage be introduced at all stations on the various lines of Railway in Bengal; and that all rags on delivery at paper mills should be disinfected by heat or otherwise. The Government, approving of the recommendations, cause them to be put into operation on all Railways in Bengal:

(1) That senders load them (the rags) themselves.
(2) That they on no account be taken to the goods sheds or wharves, but be deposited quite separate on some unfrequented spot.
(3) That senders unload under the conditions of No. 2.
(4) That not more than 24 hours be allowed free of demurrage.
(5) That demurrage, if incurred, be at a greatly enhanced rate.
(6) That all wagons used for the traffic be immediately fumigated when emptied.

Water-supply in the Chief Stations in the Eastern Bengal State Railway examined.

276. During the year I directed the Deputy Sanitary Commissioner, Metropolitan Circles, to have the water-supply at the chief stations on the Eastern Bengal State Railway line in Nuddea examined with regard to quantity, sources, apparent means of pollution, &c. It was ascertained that the water-supply was bad almost all along the line, and no attempt made to procure good water for the passengers. At the *Goalundo station* there is a tank into which water is pumped from the river Pudda. The water is not bad, but is seldom used, as this being the terminus of the line, people do not stay for refreshment. At the *Kushtea station* the unfiltered water of the Gorai river is supplied to the Native passengers and filtered water to the European passengers only. At the *Jugolee station* there is a tank on the banks of which rank vegetation and trees were seen. During the dry weather the water in this tank is subject to decomposition from the fallen leaves, &c. At the *Porada station* water is supplied to the passengers from a tank in the adjacent village, without being filtered. This tank is used for both bathing and washing purposes. At the *Chuadanga station* the water of the locomotive tank is supplied to the passengers unfiltered. The banks of this tank were filthy, and it received the washings from the huts in its vicinity, and in winter, when it almost dries up, there is great scarcity of water, as there is no other tank at a convenient distance from the station. At the *Bugoola station* there is a tank containing fairly good water, but it is covered with aquatic plants, and in April, May and June, before the commencement of the rains, there is very little water in it, which, moreover, is contaminated with decaying vegetation. Sometimes the passengers are supplied with water from a pucca well in the police-station close by. This water is good. At the *Chogda station* water is supplied from a tank which is surrounded by trees and used for bathing and washing purposes. During the winter, when this tank dries up, water is procured from another large tank a quarter of a mile away, but this tank is also used for bathing and washing. At the *Kanchrapara station* water is supplied from the locomotive tank, which is connected with a khal communicating with the Bhagiruthi river. But this tank is covered with aquatic plants. At the *Naihatti station* the water of the Hughli river is supplied after being settled with alum. At the *Barrackpore station* water is supplied to the Native passengers from a tank after being filtered and to the Europeans from a hydrant a mile away from the station. The water-supply in the minor stations is throughout bad and unwholesome.

This matter was reported to Government with a recommendation that deep wells covered over, from which the water could be raised by pumps, be constructed at each station, and that at the Barrackpore station a stand-pipe connected with the Barrackpore water-supply be put up. From the reply of the Director-General of Railways, to whom the question was referred, it

appeared that, while the water-supply is defective and bad at nearly every station, the only action taken by the Manager of the Railway was the sinking of *one* Norton's tube well at Kanchrapara, and that it is intended to enlarge and enclose the tanks at Bugoola and Chuadanga. The steps taken by the Manager are quite inadequate to meet the great evil complained of and carefully enquired into. The matter requires the serious notice of Government.

Planting of Trees in Darjiling Municipality.

277. I was asked during the year by the Commissioners of the Darjiling Municipality for my views regarding the planting of trees within the Municipality. I stated in reply that in my opinion the roads generally in a sanitarium like Darjiling, where the sun is tropical in power, should be planted so as to afford abundant shade to invalids and others moving about during the day, when it is most advantageous for them to spend all available hours in the open air. (2) That these trees should not be planted so closely as either to influence the movement of air, or lead to permanent dampness, or obstruct easy views of the neighbouring mountains. (3) That I considered the natural trees of the country, Oaks, Chestnuts, Walnuts and Magnolias, the most suitable, because this is their natural *habitat*, and disappointment does not result from their dying or becoming unsightly. The Magnolias also, from their beautiful flowers, especially the red flowering ones, would tend to render the station attractive to travellers and invalids. (4) That as a rule it is injudicious to plant trees introduced from higher levels in the hills or from elsewhere, because they do not grow so well as the trees native to the soil, and have to be renewed after a few years, increasing expense, as most of the conifers planted of late years in the station illustrated this, and Cypresses of different kinds, *Funebris* and *Torulosa*, are good examples, as they are generally dying and will require to be shortly replaced. The *Cryptomeria Japonica* is the only conifer which flourishes well, but has this objection that its dense lower branches afford shelter to squatters by the roadsides. This has led to some of them at the Chowrasta having been so cut about, that they are now unsightly objects, and will always remain so. (5) That as trees die they should be removed, and others of suitable kinds put in their places. For instance, one of the sweet Chestnuts above Ashley Dale is dead, but has not been removed. (6) That a few trees planted throughout the bazar would much improve its appearance, which is at present bare and unattractive. Proprietors of holdings there would no doubt give land for the purpose. (7) That the natural wood on the east side of Observatory Hill should be carefully preserved as the only illustration of the shrubs and smaller trees natural to the country within easy observation by visitors, and that its destruction by Nepalese and others, which is rapidly going on, should at once be put a stop to. It has been arranged in communication with the Forest Department to give effect to the above suggestions.

In connection with this subject I should mention that I caused the Officers of the Vaccination Department to report invariably where trees for shade on the roads in Bengal, generally, were wanting, or where those already planted are decaying or have died, and required removal or protection. A large number of reports on the subject were received, and were forwarded to the Road Cess Committees concerned for action.

Sanitation of Villages.

278. The following suggestion submitted by Mr. Nolan, the Magistrate of Shahabad, referring to the sanitation of villages belonging to Government, is worthy of consideration. He says:—"I think that the attention of Government might be drawn to the propriety of taking special sanitary action in its own villages, and of assigning a percentage on the rents for the purpose."

Steeping of Jute in Road-side drains.

279. The question of steeping jute in road-side drains came under my consideration during the year, and I addressed the Magistrates in whose districts the practice was supposed to be carried on, recommending the adoption of the penal bye-law framed by the district Road Cess Committee of Mymensing under Section 180 of the Road Cess Act IX (B.C.) of 1880, *vide* notification *Calcutta Gazette* of 20th July 1884. The replies indicated that in several districts this practice prevailed to so limited an extent as would not justify the adoption of the bye-law; that if the ryots are prevented using the drains for this purpose, they would in all probability use other sources of water-supply, the purity of

which was of greater importance than that of road-side drains, considering that preparing fibre from the jute plant for the market is an important trade. But the further ventilation of the subject was completely set at rest by the opinion of the Superintendent and Remembrancer of Legal Affairs, received through the Chairman of the Bogra Road Cess Committee, showing that it was outside of the competence of a District Road Committee to frame a bye-law of this nature under Section 180 of the Act.

Intra-mural and Intra-village Interments, and throwing of Corpses into Rivers.

280. I referred to these matters, but very partially, in my Annual Report for 1884. During the year under review I thought it my duty to institute a general enquiry, extending all over Bengal, as to where these very reprehensible practices, which pollute the soil and water-supply in proximity to them, obtain, and the following abstract of the reports received call for the consideration of Government. I had purposed to delineate the subject on maps, so that the extent of the practices may be seen at one view, but I could not obtain maps of suitable size, and defining the district boundaries in a special manner suited to the illustration of the subject. It will be seen from these notes that the only places in which the objectionable practice of burying the dead within or in proximity to villages is not in vogue are Chumparun and Singbhum, and some thannas in the Midnapore, Gya, Sarun, Monghyr, Bhagulpore, Sonthal Pergunnahs, Hazaribagh, Lohardugga and Manbhum districts. The Darjiling report does not state the practice which obtains in it in this respect. With regard to throwing dead bodies into rivers and other sources of water-supply, it appears that the practice does not obtain, or exists only in very limited or exceptional instances, in Serampore, Howrah, Rajshahye, Pubna, Julpaiguri, Dacca, Backergunge, Tipperah, Chittagong, Noakhali, Durbhanga, Sonthal Pergunnahs, Cuttack, Puri, Hazaribagh, Singbhum and Lohardugga, and is partially prevalent in Bankura, Midnapore, 24-Pergunnahs, Jessore, excepting in only the Narail thanna, Dinajpur, Bogra, Darjiling, Gya, Shahabad, excepting the Dumraon and Dhungaon thannas, Balasore, excepting in thannas Dhamnaghur, Balasore and Chandbali, and Manbhum. It is also seen that generally the poor chiefly, who cannot afford the cost of cremation, cast their dead into water. But this short abstract of the statements sent in will indicate how extensive both the abovementioned practices are: indeed, they constitute one of the greatest sanitary evils of the Province.

Intra-mural and Intra-village Interments.

281. *Burdwan, Bankura.*—The Mahomedans and the Boisnabs bury their dead in places set apart for the purpose within their villages, and sometimes within the enclosures of their houses, in all the thannas of these districts. Some rich families have a plot of land near their abode, in which all the dead of the family are buried. The infants of all Hindus are buried at appointed places. *Birbhum.*—In this district the Mahomedans in some instances bury their dead within their villages, and the Byragees, as a rule, bury their dead either within the enclosures of their houses or within their villages. *Midnapore.*—The Mahomedans and others bury their dead within their villages in all the thannas, except Debra, Nundigram, Panskurah, Narayangur and Muslundpur, and burials within the enclosures of houses are common in all the thannas, except Salbuni, Keshpur, Jhargram, Gopibullubpur and Sabong. *Hughli.*—In every part of this district the Mahomedans, who are well-to-do, bury their dead within the enclosures of their houses, but the poorer classes bury in the outskirts of their villages. *Howrah.*—In all the thannas in this district the Mahomedans and Jogees bury their dead, some within their villages and some near their houses. *24-Pergunnahs.*—The Mahomedans bury their dead in their villages, and in some cases within the precincts of their houses. Among some classes of the Hindus also the same procedure is observed. Jogees and Byragees bury their dead relatives, if aged, sometimes within the four walls of their dwellings, but as a rule such interments are made somewhere within the village limits. *Nuddea.*—The Mahomedans generally in all the thannas bury their dead within the enclosures of their houses or its vicinity, except those who have separate places allotted for the purpose, which are however very rare. *Jessore, Dinajpur.*—In all the thannas of these districts the Mahomedans and others

bury their dead either within their villages or within the enclosures of their houses. The same is the case in *Murshidabad*, but where regular burying grounds are resorted to, they may or may not be within the precincts of the villages. The road-side is a favourite place. *Khulna.*—In all the thannas of this district the Mahomedans and others bury their dead in their homesteads if sufficient place is available, otherwise in selected places in their own land within the village. Some rich families have a plot of land near their houses, in which all the dead of the family are buried. Infants of all Hindus are buried on the banks of the river. *Rajshahye.*—In all the thannas of this district, excepting the Municipalities, the Mahomedans and the Byragees bury their dead, the former within the enclosures of their houses generally, and sometimes out of them, but within the village, and the latter by the side of any river or canal that may exist in or near their villages. *Rungpur, Bogra, Pubna.*—Throughout every thanna in these districts the Mahomedans and Byragees bury their dead within their villages, and often within the enclosures of their houses. *Julpaiguri.*—The dead bodies of Mahomedans and others are, in all thannas generally, buried within their villages, and sometimes within the enclosures of their houses. The latter is specially the practice in the town of Julpaiguri, and is a common custom with the Boistob caste of Hindus, who do not cremate their dead. *Dacca.*—In all the thannas most of the Mahomedans, Jogees and Byragees bury their dead within their villages, and also within the enclosures of their houses. *Faridpur, Backergunge, Mymensing, Chittagong.*—The same practice is observed in all the thannas in these districts as far as all the Mahomedans are concerned, but in Faridpur the Boisnabs, as a rule, throw their dead into water, their religion forbidding cremation. *Tipperah.*—The majority of the Mahomedans throughout the district bury their dead within their villages, or within the enclosures of their houses. Villagers residing near the rivers generally bury their dead on their banks; but in a very few of the villages a plot of land is also set apart for the purpose. *Patna.*—The Mahomedans throughout this district bury their dead in selected and fixed places within their villages, and in very few instances in their own compounds. The Byragees and Kobirdasees of the Behar subdivision bury their dead close to the temples near their residences. The Jogees in the Patna or Sudder subdivision bury their dead within their own compounds. *Gya.*—In the Gya town the Mahomedans inter their dead in the burial grounds, but also close to mosques, both of which are in the town. In Sherghati the bodies are buried in and out of the villages. In Nowada and Rajowli, and in the village of Hulasganj, the bodies of Fakirs only are buried within the enclosures of their houses. In villages Rufigunge and Kutumba, some of the dead are buried in villages, and some in gardens adjoining houses. *Shahabad, Mozufferpur, Durbhanga.*—In all the thannas of these districts the Mahomedans bury their dead within their villages or within the enclosures of their houses, but in *Durbhanga* the immediate outskirts of the village are also used for the same purpose. In *Sarun.*—Only in the Sewan, Chupra, and Porsa police stations the Mahomedans and others bury their dead within their villages or within the enclosures of their houses. *Chumparun.*—Bodies are nowhere buried in this district within the enclosures of houses, neither does it appear that they are interred within the inhabited portion of the villages, except perhaps in exceptional cases. The burial grounds are generally situated sometimes at long and sometimes at short distances from the houses of the people. *Monghyr.*—In the Jamui, Monghyr, Beguserai, Kharrakpur and Surajgurrah police-stations, the Mahomedans and others bury their dead within their villages or within the enclosures of their houses. In the other thannas burials take place generally outside the villages, rarely within it. *Bhagulpore.*—In the Bhagulpore and Colgong thannas, and in some other places in the Sudder subdivision, the dead are buried within the villages; but in the other three subdivisions of the district this practice is not in force. *Purneah.*—In each village in all the thannas in this district a plot of ground is set apart in the outskirts for the burial of the dead; but wealthy Mahomedans, as a rule, have a portion of their premises set apart for this purpose. *Maldah.*—Throughout the district, most of the Mahomedans bury their dead within their villages, and a small number of them within the enclosures of their houses. *Sonthal Pergunnahs.*—In the Rajmehal station and in the outposts of Sahebganj and

Bahawa, Mahomedans are said to bury their dead within their villages, but in places set apart for the purpose. The Gossains of the Deoghur subdivision inter their dead within the enclosures of their houses. *Cuttack, Puri.*—Throughout these districts the Mahomedans bury their dead either in cemeteries or within the enclosures of their houses. *Balasore.*—In the whole of this district the Mahomedans bury their dead within the villages, and in some instances close to houses; the latter remark applies specially to the Baliapal, Basudebpur, Dhamnagar and Chandbali police-stations. *Hazaribagh.*—In Kharakdiha thanna the Mahomedans bury their dead in the outskirts of the villages and in some instances within the villages. In some villages in the Hunterganj police-station the Hindu mendicants are buried within the villages. *Lohardugga.*—In this district the Mahomedans bury their dead within the villages in all places, excepting in the Ranchi, Lodhma, Choreya, Turpa, Korambi, Tamar, Basia, Biru and Baresand police-stations. *Singbhum.*—In all the thannas in this district the Mahomedans and others bury their dead in grounds set apart for that purpose outside the limits of their villages. *Manbhum.*—In the Raghunathpur, Purulia, Para, Baghmandi and Jaipur police-stations the Mahomedans and others bury their dead within the villages or in the enclosures of their houses. The subdivisional officer of Gobindpur reports that the cholera and small-pox dead—whether of Hindus or Mahomedans—and all lepers, are either buried in the bed of an out-of-the-way streamlet or thrown into the jungle, but never cremated.

Throwing Corpses into Rivers, &c.

282. *Burdwan.*—Only low class Hindus who have no means of burning their dead frequently throw corpses into water in an uncremated or partially cremated state. This practice obtains everywhere in the district. When epidemic disease prevails, dead bodies are sometimes thrown in the jungle. *Bankura.*—It is only in thannas Bankura and Indas that some throw the dead into water uncremated or partially cremated. *Birbhum.*—Throughout the district corpses are cast into water partially cremated and in some instances uncremated by the lower class of Hindus. *Midnapore.*—In the Sudder station and Keshpur and Dashpur thannas, some of the poor classes of people throw their corpses into water uncremated or partially cremated. *Hughli.*—The poorer class of people throw their dead into the Ganges either uncremated or partially cremated as far as circumstances permit. The first class Municipalities of this district are exceptions to this rule. In none of the thannas in the Serampore subdivision are corpses cast into rivers, but the Hindus, according to their custom, throw small portions of the cremated corpses, about half a seer in weight, into water. *Howrah.*—No corpses of any village in this district are thrown into water. They are either burnt or buried. 24-*Pergunnahs.*—The poorer classes, those who are actually unable to afford the cost of cremation, throw the remains of their friends and relatives into the river, either partially cremated or uncremated; but these cases are of rare occurrence. *Nuddea.*—The Hindu poor are generally found to cast their dead into water either uncremated or partially cremated for want of necessary funds. *Jessore.*—The same practice is observed throughout this district by the poorer classes of Hindus, excepting in the Narail thanna. *Murshidabad.*—The poorer classes in this district can only partially cremate their dead, which they then throw into the nearest convenient piece of water. *Khulna.*—Throughout the district the lower orders touch the mouth of the dead with fire and then cast them into the river. Some low caste Hindus throw their infant dead into the river. *Dinajpur.*—In only the Patnitolah, Baliadangi, Kotwali, Bungshidhari and Hemtabad thannas in this district corpses are cast into water uncremated or partially cremated. *Rajshahye.*—It is only under extraordinary circumstances, such as death from snake-bite, that the dead are thrown into the water uncremated. *Rungpur.*—The poorer Hindus partially cremate their dead and then throw the bodies into the river. *Bogra.*—Excepting in the Bogra, Sherpur, Nawabganj, and Adamdighi thannas, the poorer classes, who are unable to procure wood, throw their dead into the water either uncremated or partially cremated. In *Pubna* isolated cases occur of the Hindu dead being cast into the river when difficulty is felt in procuring firewood. Dead bodies of suicides and of snake-bitten persons are generally thrown into rivers. *Darjiling.*—Some of the poorer classes in the Darjiling, Kurseong and Silliguri thannas, who cannot afford to burn the dead, do sometimes throw the corpses into the water uncremated

or partially cremated. *Julpaiguri.*—There is a general order directing the police to guard against the throwing of partially cremated bodies into rivers. Instances of breaches of this prohibition, however, occasionally occur, specially in times of epidemics. The Magistrate says it is not possible to specify the names of any thannas in which the practice alluded to is more specially prevalent. *Dacca.*—Very few Hindus of this district throw their dead into water partially cremated. *Faridpur.*—In all the thanas of this district the lower classes of the people and the poor throw their dead into rivers uncremated, the latter owing to inability to meet the necessary expenses for burning and sometimes to save the trouble of burning. *Backerganj.*—Here only the pauper dead are partially cremated and thrown into water. Unclaimed bodies and those of some Byragees are thrown into water uncremated. *Mymensing.*—In all thannas a certain percentage of the Hindu dead are thrown into water partially cremated. This practice also obtains in the cases of all the pauper dead and of persons dying intestate. Hajangs, Garos, Balois and Mandais, hill and jungle tribes, mostly found in thannas Fulpur, Durgapur, Jamalpur, Dewanganj and Sherepur, throw their dead uncremated into water. *Tipperah.*—Nowhere in this district is the practice of casting corpses into water, uncremated or partially cremated, prevalent. In cases of death occurring in boats, the corpses are said to be thrown into water uncremated. *Chittagong, Noakholi.*—In no place in these districts are corpses cast into water uncremated or partially cremated. *Patna.*—The poorer Hindus, who cannot afford to pay the cost of cremation, throw their dead into the river partially cremated, and sometimes with weights attached to sink the bodies. *Gya.*—In the jurisdictions of the Gurna, Nawada, Gobindpur, Warsabganj, Baruï, Daudnagar and Goh police-stations corpses are cast into water, uncremated or partially cremated, by those of the people who cannot afford to pay for wood. *Shahabad.*—Here the Hindus cast their corpses into water either uncremated or partially cremated, excepting in the Dumraon and Dhangain thannas. *Mozufferpore.*—In all thannas the poorer Hindus throw their dead into water, partially cremated or uncremated, after putting fire in the mouth. *Durbhunga.*—It is only when cholera rages in this district that corpses are cast into the water uncremated or partially cremated. *Sarun.*—In all the thannas in this district corpses are cast into water uncremated or partially cremated. *Chumparun.*—Only partially cremated bodies are thrown into rivers, to a more or less extent, all over the district. Very frequently the burning consists of a little fire being placed on the mouth of the corpse. *Monghyr.*—The poorer classes almost invariably dispose of the corpse partially cremated, generally only touched by fire. *Bhagulpore.*—Throughout the district the poorer classes throw the corpses into water partially cremated. *Purneah.*—The poorer classes of the Hindus cannot afford to fully cremate their dead, so they abandon it either uncremated or partially cremated. *Maldah.*—In all the thannas in this district corpses of Hindus are generally cast into the water uncremated or partially cremated. *Sonthal Pergunnahs.*—Hindus in straitened circumstances, who are unable to procure fuel, do sometimes throw their corpses into the water uncremated or partially cremated. *Cuttack.*—Nowhere in this district do Hindus throw dead bodies into the river. The Sub-Deputy Collector in charge of Killa Banki, formerly a Tributary State, annexed by Government in 1840, complained that the people of Khandpara, a bordering Tributary State, were throwing many corpses into the Mahanadi river just above Banki. *Puri.*—In no thannas of this district are corpses cast into water uncremated or partially cremated. *Balasore.*—There is not one thanna in the district in which the bodies of the dead are not cast into the water, either uncremated or partially cremated; but the statement of the Assistant District Superintendent of Police is that in thannas Balasore, Dhamnagar and Chandbali, corpses are either burnt or buried, but never cast away. *Hazaribagh, Singbhum.*—There is no thanna in these districts in which corpses are cast into water uncremated or partially cremated. *Lohardugga.*—In a few exceptional cases where people cannot collect wood for burning, they cast the dead partially cremated into water, or bury them. Among the Moondas the custom is to burn the dead close to their dwelling-houses. *Manbhum.*—In thannas Raghunathpur, Purulia and Baghmundi corpses are cast into water uncremated or partially cremated.

283. From the report of the Inspector of Emigrants, Calcutta, which has been submitted to Government, it appeared that the arrangements connected with the accommodation of the Cooly emigrants were good; that the number of rejections amounting to 47, indicated that there was some laxity in accepting recruits; that the mortality was not excessive, but that there were 14 cases of small-pox in a batch of coolies recruited in Burdwan, a district supposed to be vaccinated; that the Inspector exercised vigilance over the proper protection of the emigrants from small-pox by vaccination; and that all other matters were efficiently supervised by him during the year.

Sanitary condition of Emigration Depôts.

The report of the Medical Inspector of Emigrants, Goalundo, which was also submitted to Government, showed that the provisions of the Inland Emigration Act regarding the supply of food and clothing to the emigrants had been attended to; that the accommodation, buildings, latrine, water-supply and ablution arrangements had received attention and were kept in an efficient condition; that there was a diminution in the number of the emigrants, from causes which were explained, with a marked increase in the number of infants and children; that there was a serious outbreak of cholera during February and March which attacked 84 persons and caused 63 deaths, children and infants being mostly affected in curious contrast to the incidence of the disease in the preceding year, when not one of 777 children was attacked; that the classes of whom these coolies were made up (mostly jungly tribes from Chota Nagpur) are peculiarly liable, and are affected in much higher proportion than people from the endemic area, who appear to have, by constant exposure to the causes of cholera, acquired a certain immunity. As the time of passing through Bengal of emigrants is also one of high prevalence of the disease, so that such outbreaks are often to be feared until communications are accelerated, it is hoped that after the opening of the new Railway from Monihari on the Ganges opposite Sahebgunge no coolies for Assam will be permitted to go to Goalundo, but will be sent through Northern Bengal from the Ganges to Dhubri at once, so that coolies only for Sylhet and Cachar would come to Goalundo, and thus the danger be considerably diminished. With every extension of Railways towards the Tea districts saving of life will be effected.

284. An important work, viz., the History of Cholera in India from 1862 to 1881 prepared by Deputy Surgeon-General H. W. Bellew, Sanitary Commissioner, Punjab, was received in the office, and I was asked whether a further portion of the history, which relates to Cholera in Bengal, which was still in manuscript, should be printed or not, as the Government of India did not think it desirable to sanction the publication of the extra volumes of the history, and left it to the discretion of the several Local Governments concerned as to whether the part of the manuscript which deals with its jurisdiction should be printed or not. I replied that I considered it desirable to obtain copies of that portion of the history which relates to Bengal.

Works on Sanitation submitted by Public Officers.

At the request of Dr. Ghose, I submitted to Government the introductory chapter of a treatise which he was writing entitled "The Public Health in India," the object of which is the application of sanitary science to the special conditions of this country, for the prevention of Indian diseases, based on actual experience gained in Indian districts, with the recommendation that Dr. Ghose be privileged to present 200 copies of this treatise for the use of Municipalities. The Lieutenant-Governor preferred to have the entire work before deciding whether it could be patronized by Government.

285. In April 1884 an asylum in connection with the "Mission to Lepers in India," a private society, was started at Lohardugga under the superintendence of the Reverend F. Holn of the Lutheran Mission, the Honorary Secretaries and Treasurer of the Mission being Miss Pim and Mr. G. E. Eves, Dublin, and Mr. W. C. Baily, Edinburgh, and the Reverend J. W. Buddum, Almora. It is by no means a proselyting institution, although Christianity is brought to the notice of the patients. Its principal object is to provide a comfortable home and living and medical treatment to destitute lepers, and thereby to mitigate their sufferings and, if possible, cure them. Ten lepers had been admitted, to each of whom a separate room was given, those of them who were married being

Leper Asylum in Lohardugga.

permitted to have their families with them. Patients are admitted without distinction as to caste or creed, and, although the asylum is intended primarily for the lepers of Lohardugga, lepers of other districts will not be refused assistance. Each leper is granted a monthly allowance, varying, according to requirements, from Rs. 2 to Rs. 5 per head, and a person has been appointed to look after them on a salary of Rs. 6 per mensem. This man holds a small school, in which the children of the lepers are taught the rudiments of knowledge. It is intended, should funds be forthcoming, to provide separate accommodation for the children, to prevent them being infected by the disease. The Superintendent visits the institution twice a day, and sees that all the arrangements are properly carried out. The patients are treated on recognised principles with chalmoogra and gurjan oil, and the Native Doctor of the Charitable Dispensary visits them thrice a week, for which he is paid Rs. 5 a month, and if his services are required in cases of emergency, he is allowed one rupee per visit. The Deputy Commissioner visited the asylum while on tour and found it working in a satisfactory manner, everything kept clean, and the patients comparatively happy and comfortable.

Sanitation promoted by District Officers and others.

286. Mr. Anderson, the Magistrate of *Bankura*, who was in charge of the district for a part of the year, continued his work of having tanks reserved for the separate purposes of drinking, bathing, washing; isolated tanks during outbreaks of cholera; and caused excreta and vomit of cholera cases to be buried. The Sub-divisional officer of Rampurhat in *Birbhum* reports that believing long before Dr. Koch came to India that the germ of Cholera (as well as of many other diseases) existed in water, he was always rigidly strict in seeing that his orders relating to the conservation of water were carried out. He not only reserved tanks at the head-quarters, but also applied section 270 of the Penal Code to all cases in the interior of the Sub-division in which the banks of public tanks were fouled. He was also very energetic in adopting preventive means for arresting the progress of Cholera, by causing sulphur to be burnt in affected houses; by preventing the resort to tanks that had been used by those attacked; and by throwing in large quantities of lime into tanks in the villages where the disease was present. By these means he says he confined the progress of the disease to Pakuria, a village about a mile from the north-east limits of Rampurhat, to which village the disease had gradually come down, attacking village after village, from the north and north-east; and thus Rampurhat, which had for years previously suffered from the disease, escaped it again. In *Manbhum* Babu Rash Behari Lal Singh contributed very liberally to the completion of the Govindpur lake, and Rs. 1,000 were given for the same purpose from the funds of the late Maharáni of Pandra. The Zemindar of Jheria has also put up a very substantial and commodious shed for the local market.

SECTION X.

PERSONAL PROCEEDINGS.

PROCEEDINGS OF THE SANITARY COMMISSIONER.

Officer in charge of the Office during the year.

287. I was in charge of the Office throughout the year.

288. The 27 Municipalities named in the margin were inspected by me during the year. More would have been done had the greater part of last cold season not been taken up with the Sanitary Commission on the state of Calcutta. I also inspected, on the 17th July, at the request of the Suburban Municipality, the Moti Jheel and Kantal Bagan bustees in company with Dr. Jackson, the Civil Surgeon of the 24-Pergunnahs, and forwarded a joint report indicating the defects observed in them and the recommendations for their reclamation and improvement. Improvements had been effected, to a more or less extent, in all the towns inspected, in comparison with their condition when last visited, excepting in Chupra, where a retrogression appeared to have taken place, and in Soory, Gya and Old Maldah, where hardly any progress had been made. The sanitary condition of Burdwan, Darjiling, Monghyr, Kurseong, Berhampore, City Murshidabad, Hughli and Chinsurah, Howrah, Durbhunga and Purneah may be said to be fairly satisfactory. Not so that of the rest of the towns, chiefly Bettiah, Jamalpore, Motihari, Naraingunge, Arrah, Dacca, Serampore, Gya, Patna and Suburbs of Calcutta, the worst of all, and including Chupra, Old Maldah and Gya, already alluded to. Fuller details regarding the towns inspected will be found in Appendix IV to this Report. I may mention here, although the subject will be alluded to in fuller detail further on, that a large number of the minor towns were visited and thoroughly inspected by some of the Officers of the Vaccination Department, most largely by Dr. Ghose, the Officiating Deputy Sanitary Commissioner of the Metropolitan Circles.

Places visited and inspected during the year with results.

Lectures on Hygiene delivered at the Medical College.

289. In the capacity of Professor of Hygiene in the Medical College, I delivered 20 lectures on the subject to 33 students.

Reports on Sanitary questions submitted to Government.

290. I was appointed on the 3rd September a member of a Commission formed by the Lieutenant-Governor to enquire into and report on the adequacy or otherwise of the provisions made by the Calcutta Municipal Corporation for the cleansing and conservancy of the town, &c.—*vide* paragraph 274 of this Report. This duty occupied a great portion of my time between October 1884 and January 1885.

At the request of Government I visited the country in the Sub-division of Baraset, in the 24-Pergunnahs, drained by the Nowyee and Soontee nullahs; and investigated into the health of the locality and the causes of its alleged deterioration, &c. A full report on the subject has been submitted to Government, and the main particulars have been embodied in paragraph 122 of this Report.

PROCEEDINGS OF THE HEALTH OFFICER OF THE PORT OF CALCUTTA.

Inspection of Vessels.

291. The Health Officer of the Port of Calcutta inspected all the inward and outward bound vessels, the former amounting to 715 with 30,992 European and native seamen on board, against 815 with 29,611 seamen in

the preceding year, and the latter to 482 vessels with 15,579 seamen, against 649 with 18,378 seamen in 1883, as per details marginally furnished. It will be observed that there was a large diminution in the number of vessels inspected, excepting inward bound steamers, which show an increase of 21; but the decrease has followed a falling off of shipping entering the Port. The Health Officer performed all his duties with commendable zeal, energy and care.

PROCEEDINGS OF THE NATIVE SANITARY INSPECTOR OF THE PORT OF CALCUTTA.

Nature of duties performed.

292. A primary duty of the native Sanitary Inspector of the Port was to watch the health of the crews of all native craft in the Port, and it is satisfactory to find that this duty was zealously performed, for while in 1883 there were 212 admissions into hospital, this year the number has increased to 301. He is also charged with the inspection of the foreshore of the river, of latrines on its banks, and of drains and water-courses entering it, and with the duty of reporting to the Health Officer the existence of nuisances. He also assists the Health Officer in disinfecting vessels. During this year he inspected 12,622 boats and 371 latrines, and found 286 of the former and 18 of the latter in a filthy condition; made 289 complaints to the police; traced 341 cases of sickness on board of boats; and inspected 114 Police water-boats.

PROCEEDINGS OF THE OFFICERS OF THE VACCINATION DEPARTMENT IN CONNECTION WITH THEIR SANITARY DUTIES.

Number of Villages visited.

293. The subjoined table exhibits, collectively, the number of villages visited by the Deputy Sanitary Commissioners and the Deputy Superintendents of Vaccination, in connection with their sanitary duties, compared with the returns of the preceding year. The village sanitary inspections of Inspectors, Native Superintendents, and others holding similar rank, are not included in this table, as comparatively only a small number of them have performed this work, and they are so illiterate that what they have written on the subject in the vernacular of their districts is not worth translating; and I propose to discontinue asking for such sanitary reports, except with regard to a few particulars, as the time occupied in compilation is time almost wasted and affords excuse for neglect of duty, and the translation throws heavy work on the Office clerks of Circles, and delays the general Office work to its detriment. Their chief attention was directed to verifying the registration of births and deaths, and the account as to the manner in which they performed this duty will be found in a subsequent portion of this Section of the Report

CIRCLES.	By the Deputy Sanitary Commissioners. Number of Officers. 1884-85.	1883-84.	Number of Villages inspected. 1884-85.	1883-84.	By the Deputy Superintendents of Vaccination. Number of Officers. 1884-85.	1883-84.	Number of Villages inspected. 1884-85.	1883-84.

Behar ...	1	1	399	390				
Total ...	7	6	2,712	2,353	9	9	2,574	1,267

This table indicates that, on the whole, the sanitary condition of 5,286 villages was examined by the Officers of the Vaccination Department against 3,620 during the preceding year. Of this number, the Deputy Sanitary Commissioners inspected 2,712 against 2,353, and the Deputy Superintendents of Vaccination 2,574 against 1,267. Considering the Inspections in each Circle separately, some Circles show improvement while others show retrogression

On the side of improvement we have the Deputy Sanitary Commissioners of the Metropolitan, Darjiling, Orissa and Behar Circles, and the Deputy Superintendents of Vaccination of the Metropolitan, Eastern Bengal and Darjiling Circles. The additional number of villages inspected by these Officers are marginally noted in the order of numerical value. On the side of retrogression we have the Deputy Sanitary Commissioners of the Ranchi and Eastern Bengal Circles, and the Deputy Superintendent of Vaccination of the Ranchi Circle. The extent of retrogression is also marginally indicated. Conspicuous for good work in this direction is Dr. Ghose, the Officiating Deputy Sanitary Commissioner of the Metropolitan Circles. The Deputy Sanitary Commissioner of the Orissa Circle, Mr. P. Veeriah Naidu, has a good return, and Dr. Owen of Ranchi, though showing a less number than last year, did a good season's Inspection. The large increase shown by the Deputy Superintendent of Vaccination, Eastern Bengal Circle, Assistant Surgeon Doorga Das Roy, arises from a full season's duty being exhibited for this year against part of one in 1883-84. The Deputy Sanitary Commissioner of the Darjiling Circle and the Superintendent of Vaccination, Sonthal Pergunnahs Circle, have done little Sanitary Inspection.

294. The Subordinate Officers of the department, that is, the Inspectors, Native Superintendents, and others holding similar rank, inspected 25,769 villages, and with very few exceptions regularly verified mortuary statistics at the thanas, after ascertaining them at the villages. Extracts from their verification statements, a very large number of which was received during the year, indicating non-entries of deaths which occurred in the villages, in the registers kept up at the thanas, were, in every instance, sent to the Magistrates of the districts concerned, and this procedure was attended with the good results mentioned in paragraph 5 of this Report. I have, however, in this connection, to note that some Deputy Sanitary Commissioners and several of the Deputy Superintendents of Vaccination omitted to perform this duty, or performed it perfunctorily. A notable instance was the Deputy Superintendent of Vaccination, 2nd Metropolitan Circle, who had to be warned that if similar neglect recurred he would be reported to Government for removal from his post.

Work of the Subordinate Officers of the department.

295. All the Deputy Sanitary Commissioners, with the exception of Mr. Lyons of the Eastern Bengal Circle, and all the Deputy Superintendents of Vaccination, submitted their Diaries of vaccination and Sanitary Inspections month by month. Mr. Lyons' omission in this respect has been already animadverted on in paragraph 235 of this Report. These diaries were closely checked by me, and whenever insufficient, improper, or perfunctory work—Vaccination, Sanitary, or Registration—on the part of the Officers, from the Deputy Sanitary Commissioners down to the Head Vaccinators—was detected, due notice was taken of it, and the recusant Officer was warned or reprimanded. The chief irregularities committed by the Officers generally, as disclosed in their Diaries, were,—making Inspections in places convenient to themselves, or not far from their homes, or in places easy of access by rail or boat, whereby Inspections in the interior of the districts were omitted; incomplete Inspections; reports on Sanitation or Vaccination not made in accordance with prescribed rules; omission or delay to attend to outbreaks of Small-pox, or not reporting their occurrence; leaving large numbers unprotected in the area visited; using bad Lymph; testing Registration incompletely, or omitting to do so wholly; and by the superior Officers, insufficient supervision and omission to make observations on the work of their subordinates. Some Deputy Superintendents reported at full length on the sanitary condition of small villages with nothing special calling for remarks, thus expending much time and labour for no useful end. This was checked.

Submission of Diaries. Irregularities noticed.

296. I should mention here that whenever reports were made in the Diaries relating to the insanitary condition of any place, or to other cognate matters calling for attention, copies of such reports were forwarded to the local authorities concerned for the necessary action.

Action taken on Reports made in the Diaries.

297. A *resumé* of the observations bearing on the Sanitary condition of the Villages inspected, submitted by the Deputy Sanitary Commissioners and Deputy Superintendents of Vaccination, is subjoined. It should be mentioned that these observations are very condensed summaries of the Sanitary work performed during the working season, consisting of six months.

Reports on the Health condition of the Villages, &c., inspected, and recommendations made for rectifying their Sanitary defects.

298. METROPOLITAN CIRCLES.—*Dr. Kristo Dhone Ghose, Officiating Deputy Sanitary Commissioner.*—This Officer's observations relate to 613 villages inspected by him in thanas Bariepore, Tollygunge, Joynuggur, Baraset, Bussirhat, Habra, Baduria, Hosseinabad and Nowabgunge in the 24-Pergunnahs; thanas Kalarooa, Satkhira, Kaligunge and Assasooni in Khulna; thanas Tumluk Panchkura, Debra, Midnapore, Keshpore, Daspore and Ghatal in Midnapore; thanas Bongong and Gouripotha in Jessore; thanas Dumjoor, Jagatbullubpore and Ampta in Howrah; thanas Goghat and Jehanabad in Hughli; thanas Santipore, Ranaghat and Chogda in Nuddea, and in the Suburbs of Calcutta which he inspected frequently. *Village Sanitation.*—Dr. Ghose says that words cannot describe the insanitary condition of the villages in this Circle. The dwelling-houses are crowded together, precluding facilities for conservancy or ventilation. Site or soil are not attended to. Sweepings and refuse are heaped up in courtyards, or behind the huts, or thrown into a ditch. Frequently cowdung and cow-house litter are seen on the banks or on the slopes of tanks. These insanitary conditions prevail mostly among Mahomedans, and the poultry they rear aggravate the evil by scattering the rubbish in search of insects. Low jungle abounds all round the huts, along roadsides and paths, in the courtyards of houses, and even on the walls of the pucca houses. *Drainage.*—This is commonly defective and causes widespread malaria. Even where there is a good outfall, the village sites are not drained into them. Roads and paths in high bustees often serve as drains, while in low lands high narrow ridges are thrown up for communication, and deep trenches are consequently formed on both sides, where rain-water accumulates, stagnates, and is used for steeping jute in. Surface drains, where excavated, lead into drinking water tanks; and the drainage passes from tank to tank until the spill-water flows into a paddy-field or a bheel. Dr. Ghose noticed that in many malarious villages the outfall is invariably defective, and consists of either a silted up bed of a stream, or an undrained bheel; while in some instances, specially towards the southern portion of the 24-Pergunnahs, in the villages bordering khals which efficiently drain away much of the bheel water, leaving enough for paddy cultivation, very little malarious fever is seen, as the rain washes away all surface impurities from the villages into the paddy-fields or bheels, the impurities deposited over the fields serving as manure, and comparatively pure water flows from the khals. The immunity from malaria is specially noticeable if the khals are sluiced to prevent flood-water from entering the bheels and lowlying places in the villages. In illustration of these observations Dr. Ghose writes:—"This feature in some of the villages in the Midnapore district struck me. On my way from Kola to Gopigunge I went through a long line of villages lying on the right bank of the Roopnarain river. These villages are protected from floods by means of a very high embankment, and drained by means of sluices. The result is that such lowlying places, which in other parts of Bengal and near Ghattal in the same district would be pestilential marshes, are here smiling fields of corn. The village sites are dry, every inch of ground is under cultivation, and there is no weed or jungle to be seen anywhere. Even shallow tanks show no sign of aquatic weed in them. The people have not the appearance of malarious cachexia in them, and the children look fat and well nourished. During my tour I have also noticed that in a recently formed deltaic plain the water does not stagnate, and a sort of drainage goes on. From rivers rise *khals*, which during the rains flood all lowlying depressed basins in the country, and from these again other *khals* begin and flow, either into the same river at a lower level, or into another having a lower flood-level. Except during very high

floods, the surface drainage of the country passes either into the *khals* or into the low basins, and from there freely flows away. There is no stagnation, but a continual flushing, by means of fresh water, carries all impurities before it to the sea. But unfortunately the water in these rivers brings with it sand and silt which are deposited irregularly. Thus in time the lowland rises, *khals* are obstructed, and neither the rain-water nor the flood-water can flow. The rush of water being impeded, roads and bridges are easily made, and are made with insufficient waterways. Stagnation of moisture in the ground occurs, and malarious fevers are the consequence. At this stage artificial drainage becomes necessary. For illustration of what I have said, I will describe the condition of a tract of country which is very important and which immediately adjoins Calcutta. It extends from a line drawn from North Barrakpore to a little beyond the town of Baraset, down to another drawn across the Dum-Dum parade ground and produced east and west. It thus forms almost a triangle, having the river Hughli for its base. It was at one time inhabited by a flourishing population, and within it are situated the Infantry station of Barrakpore and the Artillery station of Dum-Dum. Since the last 30 years or so this tract of country has become very malarious. In December last I visited almost every village within this area and explored its drainage system. Forty years ago the Barrakpore, Khurdah and Kamarhatti khals, rising from the Hughli, used to bring in water and spread out into a basin of low ground lying between the high left bank of the Hughli on the west and the high villages on the right bank of the Nowyee on the east. From this basin other khals again used to carry the water into the Nowyee, which had a lower flood level than the Hughli, but a considerable portion of the drainage used to flow over the sloping country in the south and discharge itself into the Salt Water Lake. The discharging khals and the Nowyee have now silted up, and, by a series of embanked roads and railways, the free flow of water into the Salt Water Lake has been impeded. The whole area has thus been converted into blocks of marshes, the culverts and bridges acting only when the country is overflowed. In addition to the re-excavation of the Nowyee and the Soontee *nuddees* to drain the eastern portion of this part of the country, an efficient drainage channel ought to be excavated leading all the drainage from the low basins, above alluded to, to the Salt Water Lake, which in its turn ought to be reclaimed by means of embankments and sluices." *Water-supply.*—On this important sanitary question Dr. Ghose's observations are valuable. He says that no village can be said to have a supply of pure drinking water. Those situated on the banks of rivers are better off in this respect than those which depend on tanks and bheels for water, but even here it is not safe, as it is contaminated in various ways. The tanks in the inland villages all receive surface drainage, and water washing down all organic impurities and surface fœcal matter can, after a little stagnation and evaporation, be nothing more or less than sewage. The leading of surface drainage into tanks is believed to tend to their speedy silting up, and the surface detritus of years carried by the drainage into the tanks is causing the old ones to dry up. Thus the water, in addition to being bad in quality, is fast becoming insufficient in quantity. Doctor Ghose is inclined to think that the obstructed drainage of the country has something to do with the speedy deterioration of tanks, as "the soil of a deltaic country must have much organic matter in it, and as soon as the sub-soil moisture becomes stagnant, rapid decomposition of organic matter sets in. The water in the tanks being continuous with the sub-soil sheet of water must share with it in the decomposition process of the organic matter in suspension, and a prolific growth of organic germs is the result." *Food-Supply.*—Dr. Ghose's remarks on the distress caused by diminished food-supply from failure of harvest are very pertinent. After stating that he has not seen that this distress has been the cause of disease and death anywhere, he writes:—"I was struck with the indirect starvation through which a certain class of the village population are going. The price of food is rising year after year, and is telling on some of the high caste people, who have either a stationary or declining income. There are those who depend on rich relations and neighbours. These latter have either become less charitable, or their notions of charity have changed, or they have removed to Calcutta. There is the village priest and village writer whose incomes have considerably fallen. The weavers in the Ghattal and Jehanabad Sub-divisions and the artizans in Bankura, competing with the Manchester fabric, are suffering from poverty, the insanitary results of which are

slow but sure. Of course such a state of things is inevitable in a transition state of society, but it must be taken note of in accounting for disease and death in the country." *Conservancy* is conspicuous by its entire absence, and with regard to the *Disposal of the Dead*, the practice common all over Bengal of burying in shallow grounds in and near house compounds obtains in this Circle also. *Recommendations.*—On this point Dr. Ghose writes:—"From my observations, I am of opinion that want of drainage and bad water-supply are the general and crying evils in all these districts. The former has made malarial fevers and the latter cholera the endemic diseases of the country. The remedial measures in both are questions involving heavy expenditure of money, and if left to poor Municipalities and Local Boards will never be undertaken. With regard to the unhealthy dwellings and insanitary habits of the people, advancing knowledge and material progress can be pointed out as the prime remedies. The Sanitary Instructor must be abroad. Even in civilized Europe habits of cleanliness and observance of sanitary laws is of very recent date. The recent agitation in Calcutta has somewhat awakened the educated portions of the community to a sense of the importance of sanitary reforms. During my tour I found people too eager to know what would keep them in health. For this awakening to be lasting sanitary education must be extended. It is too much to expect that village *gurus* shall explain the Bengali translation of Dr. Cunningham's Sanitary Primer. The work of such teaching must begin in high schools and filtrate downwards, as all knowledge does. It is for the University to begin the work. Hygiene is not yet a separate subject of examination for the degree of Bachelor of Medicine, and the vernacular Schools of Medicine do not teach even the elementary principles of preventive medicine. The Native Doctors and Civil Hospital Assistants educated in these schools, are ignorant of the practice of vaccination. This I fear is also true of the Licentiates and Bachelors of Medicine, and yet the Compulsory Vaccination Act (Act V of 1880) accepts the certificates of "Medical Practitioners" in schedules A, B, and C. The evil effects of passing a spurious sore as successful vaccination are not fully appreciated. I therefore think that a short course of hygiene should be introduced in the Campbell Medical School, and all medical students should be compelled to practise vaccination in some of the vaccine stations in the City or in the Suburbs." *Municipalities.*—Dr. Ghose inspected the 20 Municipalities named in the margin. His reports on them show that he inspected them with great and commendable care and attention. Copies of these reports were forwarded to the Chairmen of the Municipalities in question for the necessary action, but his summary of results referring to the Suburban Municipality may be advantageously quoted here:—

Suburbs of Calcutta.		Bussirhat	Municipality.
South Suburban	Municipality.	Tanki	"
Barnagore	"	Bariepore	"
Balli	"	Joynuggur	"
Ranaghat	"	Baraset	"
Santipore	"	Tumluk*	"
Chanduria	"	Ghattal	"
Beernuggur	"	Khirpai	"
Goburdanga	"	Chundrakona	"
Baduria	"	Ramjibunpore	"

"I paid several visits to this Municipality, and am surprised to find that such a slough of dirt and filth should be allowed to encircle the Metropolis of British India. The Municipality has no means of exercising sanitary supervision. The conservancy and surface cleansing are done by contract, and the Overseers and Nuisance Inspectors are without a departmental head who has time at his disposal. Thus the establishment is ornamental, and the work is done in a perfunctory manner. The contract system should be given up, and the whole work of conservancy and cleansing should be placed under an executive Health Officer and under a good Officer. The contractor's profits would more than cover the pay of the Health Officer. To detail the evil effects of the present system would be too long for the space of this report, but I mention one or two facts to show that the sanitary administration of this Municipality is a farce. Under bustee improvement, the owner of a *bustee* is served with a notice on the opinion of two medical men, and is required to open a number of roads for purposes of conservancy The roads are opened, but no conservancy cart goes over them, because the contractor by his contract is bound to clean only the roads that existed at the time of his contract. Again, as a rule, a public latrine is built at municipal expense in a bustee on the zemindar's land. The zemindar takes possession of it, leases it

out to the night-soil contractor, who charges a fee to all inhabitants of the *bustee*. On the strength of this latrine, the Municipality disallows any private privy in the bustee and yet charges a house service fee. The poor day-labourer has thus to pay double dues, sometimes to the extent of eight and ten annas a month for himself and his family; and yet he has not a clean place to resort to. There is no drainage in the Suburbs of Calcutta. The so-called drains are deep ditches without proper levels, and sewage of all kinds passes into them. Undrained land abounds, which becomes positively swampy during the rains, or if situated near a bustee becomes a receptacle of sewage. Thus not only the rain-water percolates into the spongy sub-soil, but takes with it a large amount of organic impurities. As a result, malarious fevers, very often attended with typhoid symptoms, are prevalent. Pulmonary, consumption, dysentery and cholera are common. The water-supply is almost exclusively from tanks. No tanks in a sewage-saturated soil can be a reservoir of pure and safe water. Very often surface drainage is carried purposely into tanks for filling them. Add to this the fact that no care is taken to prevent contamination by human agency, and some conception of the quality of the water used by the people will be formed. Privies are often found all round on the immediate bank or slopes of tanks, although section 230 of the Bengal Municipal Act prohibits it. Section 225 is seldom observed. Section 232 is not observed. Many privies open on to public roads, infringing section 231 of the same Act. The Mahomedan burial grounds of Calcutta are situated in the Suburbs, too close to its thickly inhabited parts, and the burial itself is not under proper supervision. Loose shallow graves are crowded together at Manicktollah, in a badly drained piece of land, within a few feet of tanks and alongside of one of the finest thoroughfares of the city."

299. SUBURBS OF CALCUTTA.—*Assistant Surgeons Preumber Nath Mitter and Jogendro Nath Bhuttacharjee, Deputy Superintendents of Vaccination.*—The last-named Officer took over charge of this Deputy Superintendentship on the 9th February 1885, and could not consequently make any extended inspection in his charge. There is not any material point in his report which has not been dealt with by Dr. Ghose and his predecessor, Assistant Surgeon Preumber Nath Mitter. So to avoid recapitulation I omit mention of his observations here. The last-named Officer has done excellent work in the Suburbs. He inspected 132 bustees in the 14 thanas into which the Suburban Municipality is divided. His report indicates that he bestowed much attention on his charge. It is, however, too lengthy to be done full justice to in this Report; but the following record of the main facts connected with the insanitary conditions prevalent in the Suburban Municipality generally, and in certain portions of it particularly, will no doubt be useful. *Conservancy.*—There is a want of adequate and proper arrangements for the removal of sewage and refuse and surface impurities. Promiscuous defœcation was observed in some places in the drains. The latrines are filthy. *Drainage* is obstructed in many places. The ditches are in bad condition and filthy, containing decomposed vegetation and animal matter. There are many pits and hollows, containing foul, stagnant water, covered with moss or weeds, and the land is water-logged. *Cattle sheds.*—Accumulations of cowdung and urine and cow-house litter are common. This was particularly the case in Haldar Bagan, where they were found lying to the uniform width of about two yards all along the main road, and in Jogeepara and Buniapara, in thana Baliaghatta, where large quantities of dung and urine were seen in excavations and on lowlying land within and about habitations. *Water-supply.*—The tanks are polluted in every possible manner, and covered with weeds or aquatic plants, with jungle and ordure on their banks. *Ventilation* is defective generally, and free perflation of air impeded in various ways. The following are some of the most important defects which were noted in particular localities in the Suburbs. *Thana Baliaghatta.*—The site of this thana is lower than the level of the high water spring tide of the river Hugbli. It is therefore water-logged and swampy. The tanks in and about the bustees of Shaheb Bagan and Narcoldanga were pronounced by the German Doctors, deputed to investigate into the cause of Cholera in India, to contain bacilli which occasioned the cholera outbreaks in these bustees. The conservancy arrangements are bad in the extreme, and this is said to be due to the removal of night-soil and refuse being conducted by the contract system.

The practice of burning shells for lime is reported to be one of the causes of the insalubrity of the Chingrihatta Bustee. One source of unhealthiness in Butcherpara is the keeping for days together in heaps the offal of cattle slaughtered before removal to Dhappa. *Thana Manicktolla.*—The water-supply of this thana is obtained from impure sources. *Thana Kashipur.*—The malarious fever prevailing in this thana is attributed to its abounding in bad jheels, morasses and swamps. *Thana Bhowanipore.*—The main roads of this thana are comparatively clean, but as the interior of the bustees is reached many very objectionable and nasty localities are to be seen where filth abounds. This is particularly the case in Potopore, Boloram Bose's bagan, Poribazar, Gossye bustee, Gungaram bustee, Kassey bagan bustee, Badrapara and Jelliapara, where scavenging is not properly attended to; the houses are surrounded with filth, animal and human excreta not excepted; the private privies not regularly cleaned, and the public ones, although clean in appearance, stink, indicating similar neglect. The maidan and water-courses on the north of Mr. Lington's tank at Kassey bagan are freely resorted to for defœcation. The blocks of huts at *Kalighat* are surrounded with filth, and the kundu, a sacred tank to the west of the temple of Kali, was filthy and stinking. Almost all the tanks in this thana are filthy in the extreme. *Thana Garden Reach.*—The settlement of the King of Oudh and his dependents has, it is said, made Mateabrooj in this thana, once a good locality, an unhealthy bustee. *Thana Entally.*—The unhealthiness of this thana is stated to be due to the contamination of the tanks. *Thana Ekbalpore.*—A proper system of drainage is a crying want in this thana. *Thana Baniapukur.*—The disagreeable odour caused by the tanning of hides, which is largely carried on in Dugdugipara, Chamarpara and Tantibagan in this thana, is said to be a constant source of impurity to the air, likely to prove injurious to health. *Thana Tollygunge.*—Fever prevails to a greater extent in this than in any other thana in the Suburbs, due to its being damp, imperfectly drained, jungly, and to a certain extent marshy. Good tanks are nowhere to be found in it, all being contaminated and impregnated with rank vegetation. The *suggestions* for the rectification of the defects observed, submitted by the Deputy Superintendent of Vaccination, are—(1) To compel the owners to have their foul tanks reclaimed or replenished, or at least to clear out the impurities which have made the water in them unwholesome; and to fill up useless and offensive ponds. (2) To cause the Municipal Conservancy Department to attend to the cleanliness of the bustees and to conservancy generally, and to see that the municipal laws are strictly observed by the people. (3) To make the Police report defœcation in the streets, drains, and in waste places and unoccupied land. (4) To reclaim the gowalla bustees, and to compel the gowallas to keep their premises scrupulously clean. (5) To remove the tanneries to the outskirts of the bustees. (6) To attend to the drainage of the bustees, keeping them in effective working order. (7) To cause the owners of land to remove all jungle and rank vegetation. (8) The roads to be watered, and their surface cleansing to be attended to. (9) Arrangements to be made for the daily removal of night-soil from all public and private latrines.

300. 1st Metropolitan Circle.—*Assistant Surgeon Neem Chand Gupta, Deputy Superintendent of Vaccination.*—This Officer's observations refer to 300 villages in the 24-Pergunnahs, Jessore and Khulna districts. He says most of the villages are in a primitive state, abound in jungle and hollows containing stagnant water, the receptacles of vegetable refuse and sweepings. These hollows are great nuisances, emitting a foul stench. There is no regular drainage anywhere. The rain-water passes over the kutcha roads and footpaths into a bheel, paddy-field, or waste land. The villagers in Kajeepur, in thana Kotowalli in Jessore, complained that owing to the Railroad being higher up, and the calibre of the drain pipe under the Railway road not being sufficiently large, the rain-water accumulates in the village and rises up to the floor of the cattle sheds. Conservancy arrangements are absent generally, and defœcation takes place on roadsides, fields, or jungles, on the banks of tanks, ponds, rivers, bheels, or any watercourse. House sweepings and refuse are thrown anywhere, or accumulated near the dwellings, where, during the rainy season, they rot and contaminate the atmosphere. The water-supply is

obtained from rivers. tanks, bawoors (báor, or bed of the river deserted by the stream, but full of water), bheels or wells. No tanks are reserved exclusively for drinking purposes, but all are used promiscuously for all purposes. Some of them are choked with weeds, &c., and rubbish of all descriptions are seen on their banks. Moreover, the people, particularly the females, urinate in them prior to carrying away the water for use. In some places there is great difficulty in procuring water during the hot months, for want of tanks or wells and the bheels and rivers being distant. In the eastern districts fish is caught by the process called "koerkathi," which consists of dipping several large branches of trees with the leaves on, in the rivers with the view of catching the fish easily and in great number. These branches are kept under water for months continuously, the consequence being that they rot and pollute the water, rendering it unfit to drink, and yet the people use it. In some places jute is steeped in ponds within the villages. This is objectionable, but being a branch of industry cannot be interfered with. This officer also verified the deaths which occurred in the villages. The *recommendations* submitted by him are—(1) That the portion of the river Bhyrub which runs through Jessore be cleared of the weeds, &c., which choke it. (2) That public latrines be erected in places where travellers assemble in large numbers, such as Bunnogram, Bussirhat, Baduria, &c. (3) That the koerkathi process of catching fish be prohibited in all bawoors and rivers in which the water is stagnant, and is used for drinking or other domestic purposes. (4) That wells be sunk in all villages where there are no tanks and ponds, and where the bheels dry up in summer. (5) That defæcation on the banks of rivers and urinating in ponds and tanks be prohibited as far as possible. (6) That burial grounds be provided for the Mahomedans at a little distance from the village, or that a piece of land be allotted to ten or more villages for this purpose. (7) That a spot be fixed at a convenient distance from several villages whereon to throw carcasses of animals.

301. 2ND METROPOLITAN CIRCLE.—*Assistant Surgeon Kassi Chunder Dutt, Deputy Superintendent of Vaccination.*—This officer visited 842 villages in the districts of Nuddea, Murshidabad, and Birbhum. He observes that none of the villages in the two first-named districts visited by him were in good sanitary condition. They abound in jungle, large trees, and bamboo groves—in some villages to such an extent as to prevent perflation of air and obstruct light. The surface drainage is imperfect, and the water-supply, which is taken from wells, bheels, dead rivers, bad and scarce in the winter when these sources dry up, even some of the riverside villages suffer, as the rivers have silted up in several places and their mouths closed up. While suffering from deficient water in winter, the lowlying villages are subjected to much distress during the rains from overflooding. The general health in Nuddea and Murshidabad was good; but several cases of enlarged spleen and liver, the sequelæ of old malarial fever, were observed. In Birbhum the villages are comparatively in better sanitary condition. Most of these are situated on high ground, have good tanks which supply sufficient water, and are free from jungle.

302. 3RD METROPOLITAN CIRCLE.—*Assistant Surgeon Jadub Chunder Ghose, Rai Bahadoor, Deputy Superintendent of Vaccination.*—The sanitary inspections of this Officer were very satisfactory, and his report has been drawn up with care. It refers to 909 villages in 34 thanas in the districts of Burdwan, Howrah, and half of the 24-Pergunnahs districts. He says that the villages generally appeared flourishing, the houses comparatively neater, cleaner, drier, and better ventilated, the people in good health, and food, though not abundant, within the reach of all. In Burdwan alone the want was great, but up to the close of the season he did not come across a case of death by starvation. The well-to-do gladly assisted with necessaries those who suffered distress, zemindars offered to receive any reasonable rent their tenants were able to pay and to lend money on the most favourable terms, and ample work was provided to enable them to earn their livelihood. It was only the indolent, the aged, and those who were sick who suffered most. The people generally are very apathetic and slow to appreciate sanitary improvements, and will not carry out for themselves the most elementary sanitary measures, all persuasions and explanations being unheeded, the pleas

proffered being poverty, or that they do not think that any change is necessary, as their forefathers did not fare the worse from the existing state of things. The educated, however, and those who had resided temporarily in localities which have advanced in sanitation, were found to have effected great improvements, such as provision of effective drainage, clearance of jungle, proper conservation of water, erecting dry and better ventilated dwellings, and keeping them neat and clean. The important sanitary defects observed were want of drainage, absence of proper and good roads for communication, want of good drinking water, abundance of noxious vegetation, accumulations of filth and rubbish close to houses, tanks or footpaths, and promiscuous defœcation. To remedy these defects nothing short of compulsory rules are, this Officer says, indicated. Registration of deaths was also very carefully verified by him. On the whole, the general health is reported to have been good, excepting that fever prevailed very severely and fatally in thanas Ausgram and Sahebgunj in Burdwan, cholera in thanas Shampore and Juggutbullubpore in Howrah and Bistopore and Tolliganj in the 24-Pergunnahs, and small-pox in several thanas. The Deputy Superintendent afforded medical assistance and offered advice on the preventive measures which were necessary. They were adopted, it is said, with favourable results.

303. 4TH METROPOLITAN CIRCLE.—*Assistant Surgeons Mohendro Lall Bose and Preumber Nath Mitter, Deputy Superintendents of Vaccination.*—This Circle was in charge of the Officers above named, the former up to 17th February 1885 and the latter from the 18th of that month. *Assistant Surgeon Mohendro Lall Bose* visited only 36 villages in thanas Daspur, Mushlundpur or Mysadul, Tumluk, Panskurah and Nandigram in the Midnapore district, and in thanas Bishenpur, Kotulpur and Indas in Bankura, and his report on them is most unsatisfactory, clearly indicating that he bestowed very little attention in preparing it. He states that the sanitary condition of these villages was not good, tanks in unsatisfactory condition filled with panna and surrounded by bamboo and other trees, rendering the water impure and filthy; no proper roads and drains, the village pathways acting as drains; rubbish, refuse, cowdung, &c., found in heaps in many places almost close to houses; that cremation is carried on close to the villages and the rags, &c., belonging to the dead scattered about the burning places; that the houses are generally unventilated, and that nothing was done during the year to improve the sanitary condition of the villages. Registration of deaths was verified by this officer. On the whole, the general health of the Circle was reported to be exceptionally good, but the people in Bankura and Midnapore were found to have enlarged spleen and liver of long standing, the sequelæ of malarious fever, from which they had suffered in previous years. The *suggestions* offered by the Deputy Superintendent are that the old tanks should be reclaimed and trees not allowed to be planted on the banks of tanks, and that rubbish and refuse should not be allowed to be heaped up close to houses.

304. *Assistant Surgeon Preumber Nath Mitter* displayed the same activity in this Circle as in the Suburban Municipality. He inspected 192 villages in thanas Narainghur, Contai, Egra, Bhogobanpore, Sutahatta, Mushlundpore, Tumluk, Panchkurah, Midnapore, Debra, Daspore and Ghattal in Midnapore. He has submitted the following observations with regard to each of these thanas. *Thana Naraingh ur.*—Portions of this thana were stated to be malarious and the abode of cholera last year. There are swampy tracts in it, but little jungle. There are no regular roads or a proper system of drainage. Water-supply is obtained from the river Haldi, the Naraingh ur khal and tanks. The water in the river becomes brackish in the hot season. No tanks are reserved for drinking purposes, and all of them are polluted from decomposed vegetation. There are no wells. There is no conservancy. People defœcate in the fields, around dwelling-houses and along pathways. *Thana Contai.*—The chief sources of soil pollution in this thana are surface defilement, chiefly by human and animal excreta; cremation and interment of the dead within house enclosures or backyards, plantation land and gardens; and improper disposal of household garbage and refuse and other organic matters, and of carcasses. During the rains the courtyards of houses are flooded and their basements are injured, and paddy fields and low grounds become sheets of water. This lasts from July to February, and it is this that renders Contai

more unhealthy than the other thanas in the district. The tanks are offensive and impure everywhere, particularly in thickly populated villages, from organic impurities. The houses in some parts are in blocks. The drainage is defective. All the drains are open ditches with defective levels and insufficient outfall, tortuous and obstructed in several places. They are, moreover, generally used as latrines. The *Contai* town is on a lower level than the surrounding parts of the thana. *Thana Egra.*—The habits of the people in this thana are filthy, and rotton fish is their daily food. There are no thoroughfares, and during the rains this want is much felt. The water-supply is in the same objectionable condition as in Contai. The dwellings are defective in ventilation. They are, however, not damp and contain sufficient accommodation for the inmates. There is no conservancy, and sweepings, garbage and refuse are accumulated, and are a source of contamination to the soil and tanks during the rains. The insanitary conditions noted above are common, *mutatis mutandis*, to the rest of the thanas in the Midnapore district inspected by the Deputy Superintendent, but the following points claim attention:—In thana *Sutahalta* education is altogether neglected and morality is unknown, the people consisting mostly of the Podh, Chandal and Kyburto classes; no Kayustas, and only a few Brahmins, and those of the Watkul sect. The men, being idle, dislike cultivation, to carry on which they hire labourers from the Contai and Sabong thanas. They take pride in this; consequently the women do all the manual labour. The staple articles of food are rice and khesari dâl, and these are the only crops grown in this thana. Rice of fine quality are at times cultivated for sale only. Even the well-to-do live poorly. *Thana Mushlundpore.*—In this thana the Badoor Canal has silted up. There are marshy tracts of cornfields at villages Kariacharpur, Bushdebpur, Ekteerpur, Londra, Bogdu, Porbutipur, Tototikea and Tajpur, and when the rainfall is great the tracts remain flooded with water up to the end of March. The current opinion regarding this is that there had formerly been a canal from the Haldi river at Ilanogri to the Roopnarain river at the village Bankis, which was closed owing to the opening of the new canal from Gunwakhali to Etamograh. The embankment of these two khals, which enclose the above-mentioned villages, does not allow their being drained, and has thus caused a very large tract of marshy cornfields, in which the crops rot under stagnant water. This is one cause of the unhealthiness of this thana. The enclosed tract of land obtains an inflow of water by the Gunwakhali Canal, but there are no means for it to flow out. The Ganges Steam Navigation Company do not allow this water to pass out through their canal, and hence the evil. *Thana Tumluk.*—More trees require to be planted along the road from Tumluk to Panchkurah, as the existing ones are far apart. *Thana Daspur.*—Dead bodies are thrown on the sides of the embankments during the rainy season in some of the villages in this thana, and cremation takes place in the midst of its villages.

305. DARJILING CIRCLE.—*Dr. J. J. Wood, Deputy Sanitary Commissioner.*—This officer's report indicates the Sanitary Inspection work done by himself and his two Deputies, Moulvie Tujumul Hossein and Assistant Surgeon Narendra Nath Gupta. Dr. Wood inspected only 93 villages in thanas Kurseong, Punkabari, Darjiling, Sikarpore and Silligoree in the district of Darjiling; Thakurgaon, Rajarampore, Kaliaganj, Hemtabad, Peerganj and Beerganj in Dinagepore; Nattore, Putia, Beauleah, Charghat and Lalpore in Rajshahye; Bogra, Sherpore and Sahibganj in Bogra; Gobindganj, Pirganj, Mitapuker, Nisbutganj, Kowrganj and Darwani in Rungpore; Julpaiguri, Bhujimpore and Keranti in Julpaiguri; Kishenganj in Purneah; and Kharba in Maldah. Except that he inspected between 4 and 7 villages in thanas Gobindganj (4), Charghat (5), Kaliganj (5), Thakoorgaon (5), Bogra (6), and Rajarampore (7), his inspections were limited to 1 to 3 villages in the rest of the thanas.

306. *Moulvie Tujumul Hossein* inspected 50 villages in Gundwara, Sudder, Kissenganj (3 each), Kusba, Amour, Ramganj and Bahadoorganj (1 each) in the district of Purneah; Rajarampur (4), Chintamon, Parbutipur, Patiram, Mahadebpur, 2 each, Beerganj, Patnitollah (1 each) and Banshibaree (3) in Dinagepur; Silliguri outpost and Nuxulbari (1 each) in Darjiling; and Sikurpur (4), Mynaguri (3), Julpaiguri and Patgram (1 each) in Julpaiguri.

307. *Assistant Surgeon Norendra Nath Gupta* inspected 114 villages in thanas Nattore (21), Panchpore (9), Nougaon (7), Singrah (8), Putia (1), Barigram (9), Charghat (8), Gadagari (9), Lalpore (6), Bagmarah (2), and Beauleah (2) in the Rajshahye district; Kowrganj (3), Mahiganj (2), Kaliaganj (4), Dimla (1), and Darwani (1) in Rungpore; and Bogra (11), Sherpur (3), Adamdighi (1), Khettal (2), and Panchbibi (4) in Bogra.

It is apparent from the small number of villages inspected by these Officers that this branch of their duty has been very much neglected.

Dr. Wood's report is, moreover, a very poor one, and consists in great part of a commentary on the work of his subordinates. He says :—"That the names of all the places visited would fill a book," by which he evidently means the 4,037 localities visited for inspection of *vaccinations* by himself, the two Deputy Superintendents, and the 12 subordinate Inspecting Officers, the last whom performed the bulk of the work, represented by 3,780 places visited. The report shows that all the villages inspected were in an insanitary condition in every respect. The dwellings are fairly water-tight, and the overhanging eaves keep the walls dry; but they are overcrowded with inmates, surrounded with trees and jungle, which interfere with free perflation of air, and sewage and refuse lie about in heaps or in hollows. The roads, bye-paths, &c., are frequently used as latrines. There are no side drains to the roads. The water-supply is commonly bad, polluted by all conceivable means, and nowhere above suspicion. Conservancy is conspicuous by its absence. Burials frequently take place on the banks of tanks, usually close to houses, and the graves are not dug sufficiently deep. The people recognize and understand the insanitary conditions around them, but will not spend the money required to correct the defects. Registration of deaths was verified. The general health was not bad on the whole. The causes of unhealthiness are said to be malarial poison; poor food; bad water; exposure, when insufficiently clothed, to extremes of temperature; chills; and "the consequent sudden throwing of extra work upon the internal blood-glands; perhaps too early marriage."

308. RANCHI CIRCLE.—*Dr. W. Owen, Officiating Deputy Sanitary Commissioner.*—This officer inspected 479 villages, and submits a report on 132 of them, situated in 17 thanas in Lohardugga, in six thanas in Hazaribagh, and in the Sirgooja Native State. His report is creditable and carefully prepared. He says the people generally, high and low, were found to be ignorant or indifferent to sanitation or its effects. The villages inspected can only be described as filthy and disgusting. In lowlying villages pools of liquid filth, covered with a green scum, emitting horrid odour, were found immediately adjoining the houses. Holes dug in the ground in the centre of the village and filled with cowdung, &c., close to and in front of the houses, are common. These collections are said to be made for the purpose of being spread over the fields in August as manure, but as they putrify and evolve poisonous gases under the action of a strong sun and moisture, and the liquid portion filters into the ground, the evil can be easily imagined. Moreover, in the west and south of Lohardugga and in Hazaribagh, where large numbers of cattle are kept, the urine from the cow-sheds saturates the ground and gives rise to offensive odour. The condition of the villages situated on rising ground (knolls) is better, as the rain carries off with it much of the impurities noticed above. The houses in Hazaribagh are also generally better sanitated. The principal source of water-supply is what is called a dari. This is made by banking up the end of a rice field, and the term is also applied to a hole, varying in depth one to four or five feet, sunk in a rice field. Sometimes, but rarely, this excavation is surrounded by planks or sticks, or has a breastwork of stones. All water from such a source, being merely the surface drainage, is very muddy and impure, and quite unfit for drinking purposes. Water is also taken from tanks and wells. The former are few and far between, and, though there are some good ones, the majority are shallow, and their water is also muddy and impure. Wells are also rare, and with the exception of a few near the Police barracks, which contain good water, are throughout kutcha with indifferent water. Water is occasionally taken from small streams and the rivers. This water is generally of a somewhat better quality, but contains a considerable quantity of suspended matters. In Palamow and Hazaribagh, where daris are rarely met with, the principal supply is taken from wells. There is a large number of fine tanks in Hazaribagh, but they are also used for

bathing and washing clothes. The houses are deficient in ventilation and crowded together, and the majority of them are on a level with the ground, or very little raised, leading to dampness. In the great majority of cases there is no drainage in any of the villages. There is nothing objectionable with regard to the disposal of the dead. The Araons, if they can afford it, burn their dead; and if the body is partially cremated, the remains are buried, and those who can afford the expense exhume the buried portions and cremate them a second time. Generally the people resort to the fields for purposes of nature, and this practice was not found to be a nuisance anywhere, except in Hazaribagh; but here, in a few cases, bye-lanes are also used as latrines. In some cases the higher castes have sundasses or well-privies, and mehtranis are kept by some to keep these clean. The general health of the Hazaribagh and Lohardugga districts was good, except in thana Hunterganj in the former district and Toree pergunnah in the latter, where the people looked poor and ill-nourished, due, it is said, to diminished food-supply from failure of crops for some seasons past, caused by deficient rainfall. The registration of deaths in 91 villages were verified, and in 26 cases discrepancies were traced. *Recommendations.*—Dr. Owen says that, were he to make recommendations for improvements on the European standard of sanitation, volumes would have to be written, and the expense of carrying them out would be immense; but he considers the rectification of the following defects to be necessary—(1) Good pucca or kutcha wells would be a vast improvement on the daris, but in sinking them he thinks it would be advisable to consult an Engineer or Sanitary Officer as regards their position, as it is too often found that they have been constructed close to dwellings, in the centre of a town, or near other sources of impurity. The water being thus defiled, becomes a source of danger to those who use it. (2) To provide a second tank in villages where only one exists, so that one of the tanks may be reserved for drinking and the other used for bathing and washing. (3) Where jungle is being cut down and new villages being founded, proper sites should be chosen for them. (4) To keep cattle outside the villages, at a proper distance, in enclosures, to mitigate the nuisance regarding them above related.

309. *Assistant Surgeon Prosonno Coomar Dey, Deputy Superintendent of Vaccination.*—This officer's Sanitary Inspections extended over only 25 villages in thanas Purulia, Barabhum, Manbazar, Rughunathpore, Gourangdi, Govindpore, Jheria and Nirsha in the Manbhum district and in thanas Ghatsilla, Seraikella and Khursowan in Singbhum. It is noticed that, excepting 10 villages in Purulia his head-quarters, his inspections were limited to one or two villages in each of the rest of the thanas. His report is very meagre, and most of his observations correspond with those of Dr. Owen, so, excepting the following, they need not be reproduced. He says—(1) That one bad practice is that flocks of buffaloes are allowed to remain in many of the tanks for hours together, so that they urinate and defœcate in the water, which thus becomes highly polluted. (2) That there is only one tank strictly protected from pollution by the Rajah of Pachete in Kashipore. (3) That the people of Koorcha in thana Purulia suffer for want of sufficient water, especially in the hot season, as there is only one tank in the locality. They were instructed to dig wells. (4) At one village bodies were burnt by the side of the best tank in it, which was used for drinking and other purposes. The people were advised to discontinue the practice. That with regard to registration of deaths he verified the deaths in 50 villages by comparison with the mortuary rolls kept at the thanas, and he found that the registers were defective in nearly all the thanas.

310. SONTHAL PERGUNNAHS CIRCLE.—*Assistant Surgeon Kali Prosonno Ghosal, Deputy Sanitary Commissioner.*—This Officer's Sanitary Inspections extended over only 32 villages in thanas Bihipur (11), Umerpur (5), Kotowalli (5), and Colgong (7) in the district of Bhagulpore; in thanas Barharwa (1), Mohespur (1), and Pulloor (1) in the Sonthal Pergunnahs; and in thana Kharagpur (1) in Monghyr. His report does not possess much sanitary value. It shows that some of the villages inspected by him occupied elevated spots and some not. They were in the majority of instances not crowded, and contained sufficient accommodation for the inmates, but their surroundings are filthy, all sweepings and refuse and cowdung are collected near the houses, and are not removed until required to be used as manure. There

are no proper roads, and the drinking water is taken from wells and tanks. Some of the former are properly protected and some not, and the latter, in most instances, are filthy, containing decaying vegetation, and covered with weeds, &c. The dead are buried outside the villages in places set apart for the purpose, but the carcasses of animals are thrown near the villages. The road-sides and excavations near the houses are resorted to for defæcation. The general health of the people was good. Registration of deaths was verified. The Superintendent advised the people to correct the above defects.

311. EASTERN BENGAL CIRCLE.—*Mr. A. Lyons, Deputy Sanitary Commissioner.*—The Sanitary Inspections of this Officer extended over 133 villages in thanas Daudkandi, Hajigunge, Chandpore and Laksham in Tipperah, and thanas Begumgunge, Ramgunge and Lakhipore in Noakhali. He reports that he had the people in each village collected, and that he addressed them on simple sanitary subjects. He was listened to simply from a sense of respect and curiosity. All agreed in the propriety and desirableness of the suggestions made, but said that no change in the existing state of matters could or would be made without Government interference and help. They appeared to be prejudiced, timid, or apathetic, and certainly too poor to carry out any sanitary reform spontaneously. Mr. Lyons believes it is useless for an officer to point out sanitary defects to the people without having the power and means to rectify them, as they treat such advice with silent and concealed contempt. "Problematically speaking, it is to them like adding nothing to nothing, and substracting nothing from it." From all he has seen and heard he is convinced that "the masses would welcome simple reforms in the direction of sanitation under regulations prescribed and carried out under the auspices of Government. However, if the matter of sanitation be left solely to the will of the people, generations must pass before any appreciable change will be effected." Mr. Lyons gives a sketch of the topography and climate peculiarities of his Circle, which it is unnecessary to reproduce. With regard to population, he says most, if not all, the inhabitants are Hindus or Mahomedans, the latter preponderating. The Hindus are split into many castes: the Mahomedans consist chiefly of Sunis and a large number of Ferazis. The females exceed the males. The habits of the people are very filthy. They bathe in water of any quality, and a duck or two constitutes the process. They defæcate anywhere, within or outside the courtyards of their houses, or in, or near, or on the banks of tanks, or on the banks of the nearest khal or nuddi. *Dwellings.*—To protect the village from damp and annual flooding, large excavations had originally to be made to provide earth to raise the mounds and plinths on which each house stands. Thus arose the many excavations of all sizes, shapes and depth, many of which go by the name of tanks. Many of these excavations are covered with rank vegetation and form the receptacles of filth of every description, each house having one of such. The interior of the houses and the courtyards are carefully swept and kept clean, the floors being leeped. The ventilation is fair. Sewage and refuse lie immediately outside the courtyards till nature and animals remove them. The condition of the cow-houses is undescribable. The dung is heaped up close by the houses, and the stench emitted by it is intolerable *Roads.*—Beyond 'hallots,' ravines, and foot-paths, nothing like a road is to be met with in any village. During the rains the hallots are impassable from water and slush. The main roads which connect sudder stations with thanas, and thanas with thanas, are few; and the majority of them unbridged. The roads are shelterless in respect to trees, a stunted palm tree, or occasionally a pipul, is met with. The roads from Ramgunge to Lakhipore, from Lakhipore to Begumguge, and from Begumgunge to Nandana in Noakhali are entirely without shade. *Water-supply.*—In the districts of Tipperah and Noakhali water is obtained from tanks and running streams. Both sources are polluted in every way; the latter in the worst manner. Tanks are nowhere protected, but are indiscriminately used for every purpose. Micturation takes place in all of them, and defæcation in some by means of overhanging boughs or roots of trees, and the contents of machan-privies find their way into the tanks with every heavy shower of rain. Besides, all manner of house refuse are thrown on their sides and gathering grounds. The water-courses are not only subject to similar nuisances, but the carcasses of animals are cast into them, and the Byragis and Jogis submerge their dead in them. *Conservancy*

is absent from every village so far as human agency is concerned, the scavenging being mostly performed by dogs and jackals. People for the most part defœcate in the village and on the sides of streams; never on the fields. Dead cattle are thrown on the outskirts of the village, if a nuddi is not close by. *Disposal of the dead.*—Cremation takes place on the banks of running streams or on any spot where water is procurable, and not unfrequently in the villages. The Mahomedans bury their dead at a depth of about 4½ feet, either within their holdings or by the sides of old tanks, but on chur land; during the rains interment takes place in the courtyard of, and sometimes, though rarely, within, the house. *Registration* of deaths was verified and many discrepancies detected. *General health.*—The people on the chur lands looked healthy and strong, but not so elsewhere, though no special disease was present among them. The children especially looked pale and flabby, the result of frequent attacks of paludal fever. Enlarged spleens are very common, particularly in Noakhali. *Recommendations.*—Under this head Mr. Lyons submits the following—(1) To fill up the numerous huge excavations, which cause great unhealthiness, as early as possible, Government contributing a part of the cost; and (2) to introduce the hath-chitti or hand-book system for the improvement of the registration of vital statistics.

312. *Assistant Surgeon Durga Das Roy, Deputy Superintendent of Vaccination.*—This officer inspected 331 villages in thanas Kusba, Chandogram, Laksham, Hajigunge, Chandpore, Daudkandi, Nobinuggur and Brahmanberia in Tipperah; in thanas Naraingunge, Sabhar, Manickgunge, Munshigunge Raipura, Rupgunge and Srinuggur in Dacca; in thanas Goalundo, Kotalipore, Bhanga, Madaripore, Shibchar and Palong in Faridpore; in thanas Tangail and Pingna in Mymensing; in thana Begumgunge in Noakhali; and in thanas Serajgunge and Mathura in Pubna. He describes the topography of his Circle generally, and with regard to villages says, "the one peculiarity to which I would beg to draw attention, and which to my mind is a prolific source of disease in the villages, is the number of trenches, hollows, holes, pits, &c., of various sizes and depths, serving as reservoirs of water for longer or shorter periods after subsidence of the floods, and favouring the growth and decay of various aquatic plants. These are to be seen in almost every village. They are not natural peculiarities; but they have arisen out of the natural low levels of the country, necessitating the digging of earth to raise the homesteads. The obstructed drainage caused by the collection in them of the surface water is obvious enough. Then there is the mischief arising from the decomposition of vegetable substances, which grow so abundantly in them. Frequently, again, house-refuse and sweepings of every kind are thrown in them, there to putrify and spread pestilence around. The steeping of jute plants, bamboos, &c., in them is also not uncommon. Lastly, there is the practice of building privies on them. If to these be added the circumstance that, foul as the water from them is, it is sometimes used for domestic purposes, not excepting drinking itself, some idea of the mischief they are likely to do can be formed." *The people.*—Simplicity is still the leading feature in village life: the luxuries are few, harmless, and easily supplied; spiritious liquors are avoided with horror, and the number who indulge in them habitually and in excess are very few. Narcotics do not also appear to be indulged in. "The habit of cleanliness is proverbial, but it exists now only in name. The whole energy would seem to be concentrated in two things, viz. bathing and keeping the houses and courtyards clean. To those, especially the former, they pay superstitious veneration. Indeed, the mania for plunging the body in tanks has run so high that they will pay no regard to anything else. Hence the difficulty—I might almost say the impossibility—of tank conservation." Manual labour is abhorred by the high and middle classes. The Brahmans, the Vaidya, and the higher class of Sudras consider touching the plough or workman's tools a defilement. Hence the eagerness to obtain Government employment. The lower classes take to cultivation as a means of subsistence, "which bids fair to make them quite independent of the higher classes." *Dwellings.*—The villages are spacious enough, but individual mohullas in certain villages are overcrowded. Perflation of air and ventilation depends much upon the size of the rectangular courtyards, which every dwelling has, and the number of houses on its sides.

Roads and drains.—The kutcha roads are few, and fewer still the pucca ones. Roads, where they exist, have scarcely any side drains. Some villages have trenches, which instead of aiding drainage seem rather to obstruct it. The roadsides and the pathways are used as latrines. *Water-supply.*—Rivers, tanks, and wells, and in some places bheels, khalls, and dobas are the sources of water-supply. The water from the rivers is generally good, but it is highly contaminated by the burning of dead bodies on their banks, or casting these into them, uncremated or partially cremated; by burying the dead on their foreshores or banks; by the using of their sides as latrines; by the reception by them through khals, &c., of water from villages, fields, swamps, bheels, &c., after subsidence of inundation; by steeping in them of bamboos, timber, flax and jute; by bathing and washing of every kind; by the presence of decaying vegetation in them; and by the nature of the soil. *Tanks.*—Some villages have a sufficient number of tanks, others only a few which dry up in the hot season. Tank water is rendered impure by the same causes as above mentioned, but the two great sources of contamination are bathing and washing and putrifaction of vegetation. *Wells* are not much used. They are of three kinds—(1) Matiakūās, which are nothing more than temporary holes sunk in the sandy soil. They are of use only after the subsidence of floods. (2) Patkūās, in which the sides are protected by rings of burnt clay, and these have parapet walls. (3) Katkūās, in which the sides are protected by wooden planks. The quality of the well-water varies according to the nature of the soil, but it is generally good. *Conservancy.*—No conservancy arrangements exist in villages. The house refuse, liquid and solid, not consumed by animals, is thrown on the house compound. The former is at once absorbed by the soil, and the latter lies to be acted on by the "natural agencies." The cowsheds are often filthy, the dung and urine being imperfectly removed, and the former heaped up in the compounds to be used as manure for the fields or converted into cakes and used as fuel, a portion being used for plastering house floors or house walls when the latter is made of reeds. The majority of the people resort for purposes of nature to the jungles, or any other available place in and out of the villages. The few privies which exist are of three kinds. The simplest are holes dug in a secluded place behind the house. When using it the members of the household sit on the ground, until in about a week or two the hole has been filled. The filth in the meantime is being gradually eaten by dogs, cows, beetles, &c., either entirely or in part: if in part, the remainder is scraped off and thrown aside, and the hole again used. The next step in advance is in cases in which pieces of bamboo or wood are used for seats over the holes. In places subject to inundation these seats are made suitably high. Then there is the kutcha privy, in which machans or bamboo platforms, supported on bamboo or wooden posts of various heights, and used for seats also over holes. Again, there is the pucca privy, which is on the same principle as the kutcha ones, only more decent in appearance. There is no means of removing the soil from village privies, as the Bhuinmalas, the hereditary mehters, have combined not to follow the profession of their forefathers. The consequence is that filth accumulates in the privies for months together, until washed off by the floods. It is said that the beetle plays an important part in removing fœcal matter. It is most active in this respect. "Its work is visible when fœcal matter lies scattered in villages in the simple family privies, in the jungles, and in the fields. In passing through villages one is sure to find little mounds of loose earth evidently occupying the place of the fœcal matter. On carefully removing the earth, holes are discovered, which lead to subterranean passages—retreats in fact for these insects to hide themselves in and store up the fœces. By tracing these holes to their termination I have on several occasions captured beetles with the fœcal matter. *Disposal of the dead.*—The observations of the Deputy Superintendent under this head are identical with those of the Superintendent, but he adds that carelessness is sometimes exhibited in not effectually covering up the graves, and this is why they occasionally sink in; and that, although the plea for intra-village burials is want of other places, the real cause appears to be want of courage to break through an old practice. *General health* of the people is said to have been on the whole good. *Advice tendered to the people.*—It appears from the

diary of this Deputy Superintendent that in village Baliati in thana Manickgunge in the Dacca district he addressed the people with a view, as stated by him, to tell them of what he saw in their village, and especially to give them a few words of advice. He writes—"I addressed a meeting of 300 men, headed of course by the rich, the educated, and the influential zemindars of the village, on the subject of 'preservation of health.' A good deal of interest was displayed in the meeting by them, not only because all the zemindars either personally graced the occasion by their presence, or did so through younger members of the families, but likewise because they have shown their appreciation of it by actually forming themselves into an association to give effect to some of the suggestions contained in the address. For the present they have taken up two subjects, viz. *first*, to open a respectable charitable dispensary under charge of an Assistant Surgeon; and *secondly*, to build some roads in the village. For the former purpose they wish to devote the proceeds of the Shaturia hat and bazar, which are the joint properties of all the zemindars." *Recommendations.*—The Deputy Superintendent says that much must be done for the improvement of village sanitation. "To say nothing of the insanitary condition of house compounds, of bathing and washing in tanks, supplying drinking water, of burning and burying the dead within the villages, and of using the sides of roads, &c., as latrines—defects which can be easily removed by the people themselves if only roused from their lethargy—there are two things which demand speedy attention. These are the filling up of trenches, holes, &c. (gors, dobas, &c.), and the deepening of the old rivers and khals, or cutting new ones. The work, if undertaken by Government, will, in addition to securing good drainage and supplying earth for filling up dobas, &c., aid agriculture by affording means of irrigation, and supply comparatively good drinking water, and facilitate locomotion."

313. Orissa Circle.—*Mr. P. Veriah Naidu, Deputy Sanitary Commissioner.*—This Officer's inspections extended over 963 villages, situated in the Cuttack town, and in thanas Cuttack, Dharamsala, Jajipore, Salipore, Kendrapara, Patamundi, Aul, Jagatsingpore and Tirtol, in the district of Cuttack; and in thanas Khoorda, sudder, and Atghur in the Puri district. His observations, summed up, furnish the following information. Some of the villages are situated on high ground and some on low, surrounded partly or wholly by wet cultivation. The houses are kept clean; the ventilation is fair, the refuse and sewage being thrown outside of the village; cattle are kept within the dwellings; the dead are buried and burnt outside of the villages; the water-supply, taken from wells and tanks, is plentiful; and the roads and footpaths are kutcha. In the villages of Ruthia, Mirzapore, Rodia, Barimool, Hurikristopore, Tirtole, Patorea and in the Patamundi thana in the Cuttack district, and Sonapadur and Mirzapore in the Puri district, however, the streets and houses were in a very filthy condition. In the villages of Rodia, Mohanpore, Harikristopore and Patma and in the Patamundi thana in the Cuttack district, and Mungapore in the Puri district, cowdung heaps were seen in front of houses. Personal cleanliness is neglected by everybody in the Jutchra village in the Tirtol thana in Cuttack. Registration of deaths was verified, no discrepancies having been detected. The general health was, on the whole, good, except in Tirtol thana in Cuttack, where an epidemic of cholera broke out in August, September and October. The Superintendent also visited the Jagatsingpore thana in Cuttack at the request of the Civil Surgeon to investigate into an outbreak of cholera there. With this duty he combined Sanitary Inspection. He brought to the notice of the Magistrate certain nuisances at the Inspection Bungalow on the Kendrapore road, likely to be detrimental to the health of the Officers who resort to it. He reported to this office that it was necessary, in order that village traffic may be facilitated, that a kutcha road between village Puranabusant and village Purampore at Jajipore, part of which had been constructed, should be completed. He noticed that the cut which had been made in the protective embankment five miles above Aul Killa at the request of the cultivators, to supply them with water during the last drought when the river was low, had widened to about 220 feet when the river suddenly rose, owing to the work not having been properly executed originally, and that thus the flood-water stood above the level of the country about four or five feet, causing complete damage to the crops. He also noticed that six breaches had occurred on the Chandballi road at the

51st and 52nd and 53rd miles during the last rainy season. These have since been repaired. He brought to the notice of the Magistrate of Puri that a gap 24×6 feet had occurred on the Khurda Nowagur road at the 10¾th mile, which rendered traffic difficult, and he suggested to that Officer that a bridge should be erected and trees planted on both sides of the road from Baghmaree to Gowdpatna-Tickapada. The first defect has been rectified by the Road Cess Department. He also furnished an account of the Puri town, chiefly dwelling on the construction, &c., of the temple of Juggernath; the rites and ceremonies observed by the priests and people in connection with the worship of the idol Juggernath; the food used and sold; the causes which induce the people to undertake the pilgrimage to Juggernath, and the sufferings they undergo in doing so; and on other cognate matters. But as these facts are well known, they have been omitted from this record.

314. BEHAR CIRCLE.—*Assistant Surgeon Mathura Nath Sen, Deputy Sanitary Commissioner.*—This Officer's Sanitary Inspections extended over 399 villages, of which 295 are situated in thanas Dumraon, Buxar, Dhangaon, Peroo, Arrah and Belowti in the Shahabad district, and 104 in thanas Bankipore, Futua, Barh and Mokamah in the Patna district. His report embraces chiefly the following particulars. The majority of the villages in these districts differ in no way from each other as regards their sanitary condition, which is most unsatisfactory. *Topography.*—The villages situated on the south of the Railway are comparatively on a lower level than those on the north of the line, and most of them are surrounded by low, closely cultivated paddy-fields. *Dwellings.*—These are crowded together, ill-ventilated, and generally overcrowded with inmates at night. The floors are of mud, but dry, except during the rainy season. The cattle sheds are close to the houses, but kept clean. The people are active, but the low caste Hindus are intemperate to the extreme. *Roads.*—The village roads consists of narrow footpaths between the rows of houses, and these pathways also serve the purposes of drains. Most of the main district roads in Shahabad are metalled, and trees have been planted on their sides and care is taken to preserve them; but the Patna roads have been partially metalled, and some of the trees planted on them have died away, evidently from want of care. *Water-supply.*—The water-supply everywhere is obtained from wells, excepting in the few villages situated along the banks of the Ganges, and here the water of that river is used. The wells are generally situated on high ground, and most of them are protected from inward drainage by masonry parapets; but bathing and washing of clothes and cooking utensils are carried on around them, thus rendering their surroundings very filthy. The well-water is nowhere above suspicion. *Conservancy.*—Conservancy arrangements are *nil* throughout. Of the private privies that exist, the most of them consist of sundasses or well-privies. The people generally defœcate wherever they find it convenient to do so. Heaps of refuse and rubbish and numerous pits and holes, containing all the year round water of the foulest description, are to be met with. Cleanliness, both domestic and personal, are neglected everywhere, and the people are very scantily clothed. *Drainage.*—The natural drainage of Shahabad and Patna is good, the surface water easily running off to the nearest streams; but in the lowlying tracts in the latter district the alungs and bunds, which separate the paddy-fields, obstruct natural drainage greatly. These bunds are generally about five or six feet high. *Disposal of the dead.*—Interments are carried on generally outside the village, close to it, but not near tanks or wells. As regards cremation, if the village is situated within seven or eight miles from the river Ganges, the corpse is carried to that river and burnt on its banks: otherwise it is cremated on the outskirts of the village, or at the nearest stream. The process at the river side, consists of partially cremating the corpse and sometimes only disfiguring the face, and then throwing the body into the river. *Food-supply.*—The great bulk of the people subsist on maize, but the poorer classes take only one meal and that at night, consisting of rice, dâl and vegetables, or chapati or hand-made bread, taking during the day a handful of suttoo or chabani (parched grain). Curd or dahi is extensively consumed, and animal food rarely and that by the Mahomedans. Generally the coarsest and the cheapest articles are used. *Registration.*—The verification of deaths was attended to in 96 villages in Patna and in 261 in Shahabad, and discrepancies were traced in 15 villages in the

former and 54 villages in the latter district. In Shahabad the chowkidars report the events orally to the registering officer, but in Patna the hath-chitti or hand-book system is in operation, and here it is said much interest is taken in the subject. It appeared to the Superintendent that infant mortality is to a great extent not reported, as it is very difficult to obtain correct information from the men who are under the impression that, if subsequently any discrepancy is traced, the chowkidar will get into trouble; but this difficulty is not experienced with the females and children, from whom correct information is readily obtainable. *General health* was on the whole good, sporadic cases of small-pox and local outbreaks of cholera and fever excepted. *Suggestions.*—The Superintendent reports that he pointed out to the people the defects in sanitation which existed, and tendered advice for their correction, explaining the necessity of doing so; but that many of them, while recognizing the necessity of reforms, exhibited no inclination to carry them out, being quite indifferent in the matter. He is of opinion that "preachings will not produce any effect on the minds of the illiterate men," and he thinks that the application of a penal law on the subject is the only means to effect good in this direction. His suggestions for the rectification of defects are—(1) To prohibit promiscuous defœcation, limiting it to the fields outside and at a distance from the villages. (2) To prohibit accumulations of refuse and rubbish within the village and to utilize them as manure. (3) To cause the pits and hollows in the villages to be filled up. (4) To prevent bathing and washing of cooking utensils around wells. (5) To reserve some wells for drinking purposes only. (6) To cause dead bodies to be cremated completely.

Measures adopted to secure better Sanitary Inspection work.

315. With the view of giving effect to the observations of Government in paragraph 21 of its Resolution of 15th August 1884 on the Annual Vaccination Report of this department for 1883-84, referring to the small amount of sanitary work performed by the Officers of the Vaccination Department during that year, I issued the subjoined instructions with the view of impressing upon these Officers the necessity of performing full work in this direction, warning them that any negligence or remissness on their part would be brought specially to the notice of Government:—

1. Deputy Sanitary Commissioners and Deputy Superintendents of Vaccination will afford to this office in future much fuller and more carefully prepared sanitary inspection reports of the Municipalities (other than such Municipalities as form Sudder Stations, which, as usual, will be inspected by the Sanitary Commissioner), Unions, and Villages within their respective jurisdictions.

2. Those Deputy Sanitary Commissioners and Deputy Superintendents of Vaccination who draw travelling allowance during the whole year are required to utilize the hot and rainy seasons, as well as the regular vaccination working season, in making careful Sanitary Inspections of the areas above indicated.

3. The Inspection Reports should be drawn up in *narrative* form, the instructions given in sections II, III, IV, and VI of the "Rules for the guidance of the Officers of the Vaccination Department with reference to their Vaccination and Sanitary Inspection duties," being abided by, and the special points requiring remedial action, and the manner in which the defects may be rectified, being pointed out.

4. The Deputy Sanitary Commissioners and the Deputy Superintendents of Vaccination will submit their Inspection Reports to this office. These reports will be forwarded with the Sanitary Commissioner's remarks to the Municipal and Magisterial authorities concerned for the necessary action.

Bulk of the sanitary Inspection work to be performed during recess, so that the working season may not be curtailed. Appointment of Officers of a certain status to control Vaccination

316. In pursuance of the orders in the Resolution quoted, and with the similar intention mentioned, in the immediately preceding paragraph, I submitted for the orders of Government a proposition to employ the Officers of the Vaccination Department more fully in Sanitary Inspections during the recess than during the working season (when necessarily their chief attention is given to vaccination), as vaccination is still very backward in many parts of Bengal, and it would be a pity to retard its slow progress by exacting Sanitary work on a larger scale than is at present done from the vaccination staff during the very short cold season we enjoy. I pointed out that in this arrangement there was nothing which would not coincide with the orders of the Government of India, given in paragraph 7, Notification No. 150, dated the 15th March 1880, and I solicited that, in the event of this suggestion meeting with the approval of

Government, my proposals, submitted in letter No. 570, dated the 21st March 1881, for placing the Vaccination Department on a fair footing, specially with regard to Officers in control of Circles, which had been negatived, be reconsidered, as the importance of sanitary reform in districts is a matter which is becoming more and more imperative, necessitating the appointment as Deputy Sanitary Commissioners of educated officers of such a status that the high officials or landholders will listen to their views on sanitary questions with interest and respect, and that such men may be attracted to, and serve, the department permanently. I mentioned that this office is in possession of voluminous reports (some compiled with much labour) of the sanitary condition of villages in all districts in which vaccination is carried on; but beyond making digests of these and classifying the information for future use in case of legislation, very little result follows for all the trouble taken. The department outside Municipalities has no law to assist its Officers and pursuasion is its only mode of action. This can hardly be said to effect any real or permanent good. With carefully conducted Inspections, of minor Municipalities and Unions, carried on from year to year, distinct but slow sanitary improvement may be looked for; but the great task of this department lies in the reform of the life conditions of the rural population of the Province, and to effect this it will be necessary to have a strong well-paid Sanitary Department, assisted by stringent sanitary laws.

Access given to Officers of the Vaccination Department to registers of Vital Statistics kept at Police stations.

317. Instances which occurred in the Sonthal Pergunnahs Circle in which the Police objected to show the registers of vital statistics kept at the thana to the Officers of the Vaccination Department having been reported to Government, orders were issued resulting in an addition being made in the new Police Department circular, under preparation, permitting such Officers access to the registers in question.

R. LIDDERDALE, M.D.,

Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

The 30th July 1885.

APPENDIX No. I.

VITAL STATISTICS OF THE DISTRICTS IN BENGAL

FOR THE YEAR 1884.
